Carabobo, Battle of (June 24, 1821), during the Latin-American wars of independence, a victory won by South American patriots over Spanish royalists on the plains near Caracas; it virtually freed Venezuela from Spanish control. Following the instructions of the recently installed liberal government in Spain, Gen. Pablo Morillo had signed an armistice with Simón Bolívar, commander of the revolutionary forces in northern South America, in November 1820. Subsequently, the patriots broke the terms of the agreement by moving against the royalist garrison on Lake Maracaibo. At Carabobo, Bolívar led his somewhat numerically superior army of about 6,500 troops, including volunteers from the British Isles, to victory over the Spaniards, commanded by General La Torre. Gen. José Antonio Páez and his *llaneros* ("plainmen") and the British and Irish volunteers routed the Spanish right wing while the patriot cavalry crushed their centre.

caracal, also called **DESERT LYNX**, or **PERSIAN LYNX** (*Felis caracal*), short-tailed cat (family Felidae) found in hills, deserts, and plains of Africa, the Middle East, and central and southwestern Asia. The caracal is a sleek, short-haired cat with a reddish brown-coat and long tufts of black hairs on the tips of its pointed ears. Long legged and short tailed, it stands 40–45 centimetres (16–18 inches) at the shoulder and varies from 66 to 76 cm in length excluding its 20–25-cm tail. The swift caracal is generally solitary and nocturnal in habit. It preys on birds and mammals, such as gazelles, hares, and peafowl. In Asia, where

Caracal (*Felis caracal*)
Tierbilder Okapia, Frankfurt am Main

it has become rare, it has been trained as a hunting animal. The female bears litters of one to four young, which resemble the adults. The caracal sometimes is given the scientific name *Lynx caracal* or *Caracal caracal*.

Caracalla, also spelled **CARACALLUS**, byname of **MARCUS AURELIUS SEVERUS ANTONINUS AUGUSTUS**, original name (until AD 196) **SEPTIMIUS BASSIANUS**, also called (AD 196–198) **MARCUS AURELIUS ANTONINUS CAESAR** (b. April 4, AD 188, Lugdunum [Lyon], Gaul—d. April 8, 217, near Carrhae, Mesopotamia), Roman emperor, ruling jointly with his father, Septimius Severus, from 198 to 211 and then alone from 211 until his assassination in 217. His principal achievements were his colossal baths in Rome and his edict of 212, giving Roman citizenship to all free inhabitants of the empire. Caracalla, whose reign contributed to the decay of the empire, has often been regarded as one of the most bloodthirsty tyrants in Roman history.

Caracalla was the elder son of the future emperor Lucius Septimius Severus, a North African, and Julia Domna, a Syrian. He was originally named Bassianus, after his maternal grandfather, who had been high priest of the

Caracalla, marble bust, 3rd century; in the Art Museum, Princeton University
The Art Museum, Princeton University, Carl Otto von Kienbusch, Jr. Memorial Collection

Syrian sun god Elagabalus. He assumed the name Marcus Aurelius Antoninus and added the title Caesar because his father wanted to connect his family with the famous dynasty of the Antonines. In 198 he was given the title of Augustus, which nominally meant he had equal rank with his father. The byname Caracalla was based on his alleged designing of a new cloak of that name. Another of his nicknames, Tarautas, was that of an ugly, insolent, and bloodthirsty gladiator whom he was thought to resemble.

The ancient sources concerning his life and character are by no means reliable. One of

them, for example, recounts that as a boy he was amiable, generous, and sensitive and only later became insufferable; but the same source reports in another context that he was fierce by nature. Modern treatments emphasize Caracalla's Syrian heritage as one of the most important elements in his character, although here, too, due caution must be applied, since Eastern origin was in no way incompatible with a high degree of Romanization. Julia herself was well acquainted with Greco-Roman culture and hired excellent teachers to give her son the best education available. It is reported that he studied the Greek orators and tragedians and was able to quote long passages from the Greek playwright Euripides but also that he strongly despised education and educated people. This may have been the result of his passion for military life, which probably developed when he accompanied his father on his many military expeditions.

At the age of 14 he was married to Fulvia Plautilla, the daughter of the influential and ambitious commander of the imperial guard, Fulvius Plautianus; he is said to have hated Plautianus and played an important role in having him executed on the charge of a conspiracy against the imperial dynasty. He also exiled his own wife to an island and later killed her.

A significant development was the growing rivalry between Caracalla and his younger brother Geta, a rivalry that was aggravated when Severus died during a campaign in Britain (211), and Caracalla, nearing his 23rd birthday, passed from the second to the first position in the empire. All attempts by their mother to bring about a reconciliation were in vain, and Caracalla finally killed Geta, in the arms of Julia herself, it is said. There can be no doubt about the savage brutality of Caracalla's act, but a solution that would have been at once moral and practicable was not in sight.

Caracalla next showed considerable cruelty in ordering many of Geta's friends and associates put to death. Probably in order to regain goodwill, he granted an amnesty to exiles, a move denounced as hypocritical in ancient sources, which also slander Caracalla's most famous measure, the so-called *Constitutio Antoniniana de Civitate*, as a device designed solely to collect more taxes.

His expeditions against the German tribes in 212/213, when he senselessly massacred an allied German force, and against the Parthians in 216–217 are ascribed by ancient sources to his love of military glory. Just before the Parthian campaign, he is said to have perpetrated a "massacre" among the population of Alexandria, probably in response to a disturbance there.

Caracalla's unpredictable behaviour is said to have prompted Macrinus, the commander of the imperial guard and his successor on the throne, to plot against him: Caracalla was assassinated at the beginning of a second campaign against the Parthians.

Important for the understanding of his character and behaviour is his identification with Alexander the Great. Admiration of the great Macedonian was not unusual among Roman emperors, but, in the case of Caracalla, Alexander became an obsession that proved to be ludicrous and grotesque. He adopted clothing, weapons, behaviour, travel routes, portraits, perhaps even an alleged plan to conquer the Parthian empire, all in imitation of Alexander. He assumed the surname Magnus, the Great, organized a Macedonian phalanx and an elephant division, and had himself represented as godlike on coins.

Another important trait was Caracalla's deeply rooted superstition; he followed magi-

cal practices and carefully observed all ritual obligations. He was tolerant of the Jewish and Christian faiths, but his favourite deity was the Egyptian god Sarapis, whose son or brother he pretended to be. He adopted the Egyptian practice of identifying the ruler with god and is the only Roman emperor who is portrayed as a pharaoh in a statue.

In the many portraits of him, the expression of vehemence and cruelty is obvious, and some sources say that he intentionally reinforced this impression, perhaps because it flattered his vanity to spread fear and terror. It is also said that he was of small size but excelled in bodily exercises, that he shared the toils of the rank and file but also weakened his virility by a dissolute life and was not even able to bear the weight of a cuirass.

A similar inconsistency characterizes the judgments about his mental state. He was said to be mad but also sharp minded and ready witted. His predilection for gods of health, as documented by numerous dedicatory inscriptions, may support the theory of mental illness. If Caracalla was a madman or a tyrant, the fact had no great consequences for his administration of the empire, which may or may not have been vitally influenced by Julia Domna and the great jurists who surrounded him. He was venerated by his soldiers, who forced the Senate to deify him after his death, and there is no indication that he was especially disliked among the general population. In any case, the Roman Empire at that time was still strong enough to bear a ruler who certainly lacked the qualities of an outstanding emperor. (F.P.K.)

BIBLIOGRAPHY. English translations of the ancient sources in the "Loeb Classical Library": Cassius Dio, *Dio's Roman History*, trans. by E. Cary, book 77-79; *Herodian*, trans. by C.R. Whittaker, book 3 and 4; *Scriptores Historiae Augustae*, vol. 2, trans. by D. Magie. The most reliable of these sources is Cassius Dio. The most detailed treatment of Caracalla's life and reign is the dissertation of D.C. Mackenzie, *The Reign of Caracalla* (1949).

Caracalla, Baths of, Italian TERME DI CARACALLA, ancient (Latin) THERMAE ANTONINIANAE ("Antonine Baths"), public baths in ancient Rome begun by the emperor Septimius Severus in AD 206 and completed by his son, the emperor Caracalla, in 216. Among Rome's most beautiful and luxurious baths, designed to accommodate about 1,600 bathers, the Baths of Caracalla continued in use until the 6th century. The extant ruins, together with modern excavations and restorations (including conspicuous reconstructions), are the most extensive of any surviving Roman bathing establishments and consist centrally of a block of large vaulted bath chambers covering an area of 750 by 380 feet (230 by 115 m), with courts and auxiliary rooms, surrounded by a garden with space used for exercise and games.

There were three main bath chambers: the frigidarium, or cold room; the caldarium, or hot room; and the tepidarium, or lukewarm room. Between the frigidarium and the tepidarium was the great hall, roofed by an enormous vault with clerestory windows, a prototype of the vaulted naves of the medieval churches. There were also large open-air swimming pools. Marble was used lavishly, and sculpture, mosaics, frescoes, and other decorations ornamented the interior.

In the summertime, the Baths of Caracalla are the site of open-air opera performances, employing spectacularly large casts for such operas as *Aida* and *Carmen*.

caracara, also called CARRION HAWK, any of about 10 species of birds of prey of the New World subfamily Polyborinae (or Daptriinae) of the family Falconidae. Caracaras feed

largely on carrion, birds, reptiles, and amphibians. They are gregarious and aggressive. In spite of their smaller size, they dominate vultures when feeding. Caracaras are recognized by their long legs and by the reddish naked skin of the cheeks and throat. They range in size from 40 to 60 cm (16 to 24 inches) long.

The common, or crested, caracara (*Polyborus plancus*) occurs from Florida, Texas, Arizona, Cuba, and the Isle of Pines south to the Falkland Islands and Tierra del Fuego. The subspecies occurring in the United States is called Audubon's caracara (*P. p. auduboni*).

Other species occurring in South America include the chimango, or beetle eater (*Milvago chimango*), and the black caracara (*Daptrius ater*). The smaller South American species eat insects.

Caracas, city and capital of Venezuela. One of the most developed and cosmopolitan of Latin American cities, it lies 3,025 feet (922 m) above sea level in a high valley surrounded by two mountain groups of Venezuela's northern highlands, the Coastal and Interior ranges. The Caribbean Sea is 7 miles (11 km) to the north. Area city, 30 square miles (78 square km); metropolitan area, 139 square miles (361 square km). Pop. (2000) city, 1,975,787; Federal District, 2,284,921.

A brief treatment of Caracas follows. For full treatment, see MACROPAEDIA: Caracas.

Caracas' metropolitan area includes the Federal District and adjoining parts of the state of Miranda; it extends more than 7 miles (11 km) from north to south and more than 15 miles (24 km) from east to west. Almost all of the valley's inhabitable area has been blanketed by urban development. Caracas' principal river is the Guaire, once large and important but now reduced to a small volume. The climate is mild, with a summer dry season and a winter rainy season.

The city's industries include the production of sugar, processed foods, tobacco, and clothing. Services account for most local employment. Caracas is the country's centre of both domestic and foreign commerce, the site of most government offices, the administrative centre for petroleum-related activities, and the seat of the major banking houses.

Construction and urban development reached a peak in the 1960s and '70s, and the change in the appearance of the city was abrupt and overwhelming. One of the most imposing structures in the downtown area is the massive Simón Bolívar Center, with its adjoining network of shops, restaurants, and passageways; its twin towers are flanked by Santa Teresa Church and a seven-block commercial and residential area. The colonial city has been preserved around the Plaza Bolívar. On its perimeter are located the old cathedral, the archbishop's residence, municipal buildings, and the ministry of foreign affairs.

Caracas' most important centre of higher education is the Central University of Venezuela (1721). Other universities are Simón Bolívar (1970), Andrés Bello Catholic (1953), and Santa María (1953). Art galleries augment the city's older museums and libraries.

Caracas has a subway and several large expressways, and it is linked by highway to the coast and to other Venezuelan towns. Maiquetía Airport, located on the coast 10 miles (16 km) away, provides domestic air service, while Simón Bolívar Airport, adjacent to Maiquetía Airport, serves international flights. Most consumer merchandise and much of Venezuela's capital goods are imported through Caracas' ports, La Guaira and Puerto Cabello.

Caracas Company (colonial trading company): see Guipuzcoana, Compañía.

Caracciolo, Francesco, DUKE (duca) DI BRIENNA (b. Jan. 18, 1752, Naples, Kingdom

of Naples [Italy]—d. June 28, 1799, Naples), Neapolitan admiral who was executed on the orders of the British admiral Horatio Nelson for supporting the republican revolution at Naples in 1799. Considered a traitor by some Italians, he at first supported King Ferdinand IV of Naples but later accepted command of the navy of the Parthenopean Republic, which was declared Jan. 23, 1799, when the French took over Naples.

Caracciolo gained most of his experience as a naval officer fighting for the British against the Americans in the War of Independence (1775-83). He returned to Naples in 1781 and, under Nelson, fought the French at Toulon in 1793. Caracciolo continued to fight them even after Ferdinand IV signed an armistice with Napoleon. Later, in 1798, the French captured Naples, and Ferdinand fled to Palermo aboard Nelson's ship, with Caracciolo following behind. During the voyage, a storm arose that nearly caused Nelson's ship to founder, while Caracciolo sailed through it easily; afterward, Ferdinand praised Caracciolo's seamanship, thus allegedly arousing Nelson's jealousy.

Caracciolo returned to Naples (then the French-imposed Parthenopean Republic), perhaps with Ferdinand's permission, because the estates of those who were absent were being seized. Caracciolo was offered command of the Parthenopean navy, which was in a state of disrepair, and he soon turned it into an efficient force. Ferdinand recaptured Naples from the French in 1799. Though the terms of the armistice forbade reprisals, Nelson summarily tried and then hanged Caracciolo for treason aboard his flagship, the *Minerva*.

Caracol, major Mayan city, now an archaeological site in west-central Belize, 47 miles (76 km) southeast of the Guatemalan Mayan city of Tikal. The name is Spanish (meaning "snail"); the original Mayan name is unknown.

A woodcutter discovered the ruins in 1938, but archaeologists did not begin to survey the site until 1952-53. A team headed by Diane and Arlen Chase of the University of Central Florida began to clear and excavate Caracol in 1985. The excavations have uncovered pyramids—the highest at 139 feet (42.5 m)—dozens of royal tombs, dwellings, monuments, and a ball court, in addition to such artifacts as ceramics, painted murals, altars, and carvings.

Caracol was probably first inhabited about 300 BC. Mayan glyphs found at the site, as well as other evidence, suggested that Caracol flourished during the middle Classic period (c. 6th century AD), becoming the major regional power by about AD 562, when it defeated Tikal in a war. At its apogee Caracol may have included some 36,000 structures and tens of thousands of residents. The city declined from about 700 and was probably razed during the 9th century. No major buildings were erected there after 850, and the site was apparently abandoned completely by the 12th century.

Caracol has become a tourist attraction for Belize; however, unlike at Tikal, workers have not attempted to restore the major monuments at Caracol. In 1995 the boundaries of Chiquibul National Park (1991; formerly a forest reserve) were extended to include Caracol, which covers an estimated 35 square miles (90 square km).

Caractacus (British chieftain): see Caratacus.

Caradec de la Chalotais, Louis-René de: see La Chalotais, Louis-René de Caradec de.

Caradoc (British chieftain): see Caratacus.

Caradoc Series, also called CARADOCIAN SERIES, the fifth of six subdivisions (in ascending order) of the Ordovician System, comprising

all those rocks deposited worldwide during the Caradocian Age (458 to 448 million years ago). The series' name is derived from the hills called Caer Caradoc, near Church Stretton in Shropshire, England. The type section is located in the valley of the Onny River near Horderley, across the border in Wales, but the base of this section is unconformable and diachronous and thus unsuitable as a global stratotype section. The Caradoc strata of northern Wales reach a thickness of more than 2,000 m (6,000 feet) and are exposed as graywackes, mudstones, thin limestones, and fine-grained black shales. Silica-rich rhyolitic lavas and tuffs also occur and can be seen at Snowdon mountain.

No global stratotype and point (GSSP) has yet been defined for the series by the International Commission on Stratigraphy. The base of the biozone of the graptolite *Nemagraptus gracilis* has been applied as the base of the Caradoc, but this fossil zone has been found to extend far down into the underlying Llandoilo Series. Thus, the base of the Caradoc Series is in urgent need of redefinition. The biozones of the conodonts *Amorphognathus tvaerensis* and *A. superbus* extend through the Caradoc Series. The Caradoc is overlain by the Ashgill Series.

Caradon, district, county of Cornwall, England. It lies between Bodmin Moor and the English Channel; the River Tamar forms the boundary with Devon to the east. The district depends on Plymouth in Devon for many services and is linked to that city by road and rail bridges across the Tamar River at Saltash, car ferry at Torpoint, and pedestrian ferry at Cremyll.

Bodmin Moor is formed of a granite intrusion that reaches heights of more than 980 feet (300 m) and is capped with tors. The valleys on the moor are open, but they become incised and wooded on the granite boundary. The upland is covered with moorland vegetation, and local farmers have extensive grazing rights, used for both sheep and cattle.

Calstock and Gunnislake in the Tamar River valley are linked with Plymouth by a branch railway and have become residential areas. The lower Tamar valley is an area of intensive cultivation whose mild local climate is relatively free of frosts. Strawberries and other soft fruits are grown there, and flowers, grown both outside and in greenhouses, are another major source of income. Some early vegetables are cultivated for markets in London and the Midlands, and stock raising (dairy and beef cattle, sheep, and pigs) is also important.

Liskeard is the major market and service centre and has expanded as a residential area, with a small industrial estate to the west. Saltash has developed strong links with nearby Plymouth and is a growth point for light industry and services, as well as for residential development. At Torpoint a ferry connects with Devonport across the Hamoaze (lower Tamar). The south coast is picturesque, with cliffs, sandy bays, and submerged inlets. Small fishing ports have grown at Looe and Polperro, which have expanded as tourist centres, with chalets and sites for tents and caravans (trailers). Area 256 square miles (664 square km). Pop. (1991 prelim.) 75,800.

Caragiale, Costache (b. March 29, 1815, Bucharest, Walachia, Ottoman Empire [now in Romania]—d. Feb. 13, 1877, Bucharest, Rom.), actor-manager who helped to encourage the development of a unique Romanian drama.

Caragiale made his stage debut in 1835 in Bucharest, and in 1838 he organized a theatre of contemporary drama in Iași (now Jassy). During the next 15 years he worked with regional theatres, notably those in Iași, Botoșani, and Craiova, where he promoted the plays of the most talented dramatists of the period, including Vasile Alecsandri and Constantin

Negruzzi. He returned to Bucharest in 1850, and two years later he was named director of the National Theatre.

His nephew Ion Luca Caragiale became one of Romania's greatest playwrights, and his younger brother Iorgu was a successful actor and director in Iași and other provincial towns. In 1887 Iorgu constructed his own theatre in Bucharest.

Caragiale, Ion Luca (b. Jan. 30, 1852, Haimanale, Walachia, Ottoman Empire [now in Romania]—d. June 10, 1912, Berlin, Ger.), Romanian playwright and prose writer of great satirical power.

Caragiale's comedies expose the effects on Romanian urban society of the hasty introduction of a modern way of life and the comical results of social and political change. *Conul Leonida* (1879; "Mr. Leonida"), *O noapte furunoasă* (1880; "A Stormy Night"), and *O scrisoare pierdută* (1884; "A Lost Letter") are among his most popular plays. With *Năpasta* (1890; "The False Accusation"), he created the peasant drama. His short stories, *O făclie de Paște* (1889; "An Easter Torch"), *Păcat* (1892; "The Sin"), and *Kir Ianulea* (1909), are among the best prose works in Romanian literature; *Momente* and *Schițe* are vivid sketches of the change from rural to urban society.

Carajá, also spelled KARAJÁ, tribe of South American Indians living along the Araguaia River, near the inland island of Bananal, in central Brazil. Their language may be distantly related to Ge, which is spoken by most of the surrounding tribes. The three subtribes of the Carajá—the Carajá proper, the Shambioá, and the Javahé—have almost identical cultures and are all oriented toward the river rather than toward the forest. The principal source of food is fish, with agricultural produce of almost equal importance. Clearings are made in the jungle flanking the river and planted with cassava, corn (maize), and a variety of other crops. The Carajá wear little clothing but use a variety of ornaments. Men wear labrets in the lower lip, as well as earplugs, while both sexes use a great deal of body paint and tattoo a small circle on each cheek as a tribal mark.

In the wet season large, permanent thatched houses are occupied by the members of several related families; during the dry season flimsy shelters are built on the sandy beaches along the river. Within the village the social unit is the extended family, and the heads of these families are the effective leaders of the society. The village chief, although granted considerable deference, has little authority. For most purposes the villages are independent of one another, but some adjoining villages cooperate in religious ceremonies.

The Carajá are noted for the singing and dancing that are prominent features of all ceremonies. The religion is dominated by the men, who hold masked dances during which they impersonate spirits and the ghosts of slain enemies.

Caralis, plural CARALES (Roman city, Sardinia): see Cagliari.

caramel, candy substance obtained by boiling sugar to or beyond approximately 240° F (115° C), at which point its mass takes on a slightly yellowish colour and pleasantly burnt smell.

Caramels vary in consistency between the short, or soft, and the long, or more chewy types depending upon the proportions of ingredients. Corn syrup added to the basic sugar constituent controls graining and contributes body. Milk, essential to the traditional "caramel-candy" flavour, imparts a creamy, collapsible consistency. The blended ingredients, including fats and starches, are stirred continuously during cooking and then poured into vessels or over cooling slabs in preparation for cutting and wrapping.

Although the making of cream caramels requires a high degree of skill, caramel is a basic candy that is more important to mass producers of sweets than to the individual confectioner. Various grains of caramel may be dipped, coated, or coloured and flavoured with fruit and nuts, as well as coffee. Apples coated with caramel and skewered on sticks are a popular form of the candy in the United States.

Cāran, Hindu caste of hereditary genealogists, bards, and storytellers located in Gujarāt state in western India. They claim origin from the Rājput caste of Rājasthān and may be of mixed Brahman (priestly) and Rājput extraction. Many of their customs are similar to those of their northern Indian counterparts, the Bhāṭis; both groups had a reputation of preferring death to breaking a promise. The Cāran compose their ballad poetry, which treats of warriors and kings, in a special western Rājasthān dialect, called Dingal, that is not used for any other purpose.

Consult the INDEX first

Caran d'Ache, pseudonym of EMMANUEL POIRÉ (b. 1858, Moscow, Russia—d. Feb. 26, 1909, Paris, France), caricaturist and illustrator whose line drawing was notable for its crisp, forceful simplicity. The name Caran d'Ache transliterates the Russian word for pencil.

He was educated in Moscow but settled in Paris, where he gained great popularity as a contributor to several periodicals. He was an early exponent of the episodic strip cartoon technique and was also a well-known illustrator. The grandson of a Napoleonic officer, he spent five years in the French army and often favoured military subjects in his illustrations. Essentially self-taught, he was particularly influenced by the contemporary German caricaturists Wilhelm Busch and Adolf Oberländer.

carangid, any fish of the family Carangidae (order Perciformes), which contains more than 200 species of marine fishes, including such well-known forms as the jacks and pompanos. Carangids are swift, predatory, usually silvery fishes found throughout the world in warm

Lookdown (*Selene vomer*)

By courtesy of the Miami Seaquarium

and tropical regions. They are primarily marine, but some live in brackish water or fresh water.

The members of the family vary greatly in form, from elongated and streamlined to very deep-bodied and thin from side to side. In general, however, they bear the following features in common: two dorsal fins, the first of which may be reduced to a few small spines; anal and second dorsal fins, usually high in front; pectoral fins slim and often sickle-shaped; tail base very slender; tail strong, either forked or crescent-shaped; scales small; lateral line (series of small sense organs along the head

and sides) often partly or wholly covered with large, hard, keeled scales (scutes).

Many of the carangids are small, but some grow to a large size. The greater amberjack (*Seriola dumerili*), for example, reaches a length and weight of about 1.8 m (6 feet) and 70 kg (150 pounds). The members of the family are known by various common names. There are the moonfish, pompano, pilot fish, runner, jack (*qq.v.*), and others. One of the most unusual-looking Atlantic carangids is the lookdown (*Selene vomer*), with an exceptionally thin body and high "forehead." The first rays of the second dorsal fin extend into filaments that reach to the tail. Many of these fishes are valued for food or sport. Certain species, however, such as the greater amberjack and several jacks, may at times carry a toxic substance in their flesh and, when eaten, cause ciguatera, a form of poisoning.

Caraquet, town and fishing port, Gloucester county, northeastern New Brunswick, Canada. It lies along Caraquet Bay (an inlet of Chaleur Bay), near the mouth of the Caraquet River, 42 miles (68 km) northeast of Bathurst.

Founded about 1760 by shipwrecked French seamen, it is one of the province's oldest French settlements and was named for the bay, which may have derived its name from a French nautical term, *caraque*, meaning "carrack," or "large galleon." After 1784 the town became strongly French Acadian.

It is now the home port for a large Atlantic fishing fleet and has a fisheries school, boat-building facilities, and fish-, crab-, and oyster-packing plants. Historical associations are reflected by its Acadian Museum and the nearby reconstructed Acadian Historical Village. The blessing of the fleet by the bishop of Bathurst is a notable annual (July) event. Inc. 1961. Pop. (2001) 4,442.

Caras-Severin, *judet* (county), southwestern Romania. It is bounded on the south and west by Serbia and Montenegro. The Transylvanian Alps (Southern Carpathians), including the ranges of Semenic, Cernei, and Poiana Ruscă, rise above settlement areas in the intermontane valleys. The eastward-flowing Danube River and its tributaries, including the Timiș River, drain the county. Reșița (*q.v.*) is the county seat.

The county's agricultural activities include livestock raising and cereal and fruit cultivation. Iron, manganese, feldspar, pyrite, coal, and anthracite mines operate in the county, and marble is quarried near Ruschița. Reșița, Bocșa, and Oțelu Roșu have metal-products and machinery industries. Building materials are produced in Căvâran, and several towns in the area have factories producing wood products and foodstuffs. A hydroelectric plant operates on the Nerganița River near Văliug.

The battle of Tapae, fought between the Dacians and Romans, took place at the Iron Gate of Transylvania Pass (2,293 feet [697 m]), located about 24 miles (39 km) east of Caransebeș. Extending south from Caransebeș, a highway follows a Roman road built along the Timiș River. Plugova, Mechadia, Teregova, and Băile Herculane are towns in the Timiș valley in which the Romans built camps. Flint implements from the Paleolithic Period (about 2,500,000 years ago) and Neolithic objects were found in caves near Băile Herculane. The nearby Mount Domogled Nature Reserve has a large variety of butterflies and moths. Borlova and Văliug are mountain resorts. Railway and highway connections extend through Reșița and Caransebeș. Area 3,283 square miles (8,503 square km). Pop. (2002) 333,396.

carat, unit of weight for diamonds and certain other precious gems. Before 1913 the

weight of a carat varied in different gem centres. Originally based on the weight of grains or leguminous seeds, which, of course, varied in size from place to place, the carat was equivalent to 0.2053 gram (3.168 troy grains) in London, 0.1972 g in Florence, and 0.2057 g in Amsterdam. The weight of a gemstone was calculated in terms of whole carats plus fractions ($\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, $\frac{1}{32}$, or $\frac{1}{64}$) of a carat; thus, a stone might be said to weigh $3 + \frac{1}{4} + \frac{1}{16}$ carats. After various unsuccessful attempts to standardize the carat, the metric carat, equal to 0.200 g, and the point, equal to 0.01 carat, were adopted by the United States in 1913 and subsequently by most other countries. The weights of diamond, ruby, sapphire, emerald, topaz, aquamarine, garnet, tourmaline, zircon, spinel, and sometimes opal and pearl are expressed in carats.

carat (gold): see karat.

Caratacus, also spelled CARACTACUS, Celtic CARADOC (fl. 2nd and 3rd quarters of the 1st century AD), king of the British tribe of Trinovantes, and the son of Cunobelinus (*q.v.*).

Caratacus' kingdom, embracing the Atrebatas of Hampshire and probably the Dobunni of Gloucestershire, lay in the west. At the time of the Roman invasion of Britain during the reign of Claudius, he led the native resistance against Aulus Plautius (AD 43-47) and, after being defeated, withdrew into south Wales. He was finally defeated by Ostorius Scapula in AD 50, somewhere on the Welsh marches, in the territory of the Ordovices. He himself fled to the Brigantes, whose queen, Cartimandua, delivered him to the Romans. He and his family were featured in a victory parade of Claudius, who granted them pardon and life.

Caratasca Lagoon, Spanish LAGUNA DE CARATASCA, lagoon in northeastern Honduras. The nation's largest lagoon, Caratasca extends inland from the Caribbean Sea for approximately 25 miles (40 km) and measures up to 55 miles (88 km) from northwest to southeast. It is linked to the Caribbean by a 3-mile (5-km) channel, on the bank of which stands the village of Caratasca. Many islands, the largest of which is Tansín, dot its waters, and its low-lying shores are lined with dense tropical rain forests, which yield mahogany and cedar; shrimp are caught in the lagoon. The principal town is Puerto Lempira, on the southern shore.

Carathéodory, Constantin (b. Sept. 13, 1873, Berlin, Ger.—d. Feb. 2, 1950, Munich), German mathematician of Greek origin who made important contributions to the theory of real functions, to the calculus of variations, and to the theory of point-set measure.

After two years as an assistant engineer with the British Asyūt Dam project in Egypt, Carathéodory began his study of mathematics at the University of Berlin in 1900. In 1902 he entered the University of Göttingen, where he received his Ph.D. (1904) under the German mathematician Hermann Minkowski. After teaching at the Universities of Hannover (1909), Breslau (1910-13), Göttingen (1913-18), and Berlin (1918-20), he accepted a post at the University of Smyrna, which the Greeks were setting up in Anatolia. When the Turks razed Smyrna in 1922, Carathéodory managed to save the university library, which he moved to the University of Athens, where he taught until 1924. He then was appointed professor of mathematics at the University of Munich.

Carathéodory's contributions to the calculus of variations include a comprehensive theory of discontinuous solutions, in which previously there had been only limited findings. He also added important results to the relationship between first-order partial differential equations and the calculus of variations. His work on the problems of variation of m -dimensional surfaces in an n -dimensional space marked the first far-reaching results for the

general case. He contributed important findings to the theory of the functions of several variables and simplified the proof of the main theorem of conformal representation of simply connected regions on the unit-radius circle. His investigations of the geometrical-set theoretic properties of boundaries resulted in his theory of boundary correspondence. He also contributed to thermodynamics and helped to develop Einstein's special theory of relativity.

His published works include *Vorlesungen über reelle Funktionen* (1918; "Treatise on Real Functions"), *Conformal Representation* (1932), *Geometrische Optik* (1937; "Geometrical Optics"), *Reelle Funktionen* (1939; "Real Functions"), and *Funktionentheorie*, 2 vol. (1950; "Function Theory").

Carausius, Marcus Aurelius Mausaeus (d. AD 293, Britain), officer in the Roman military service who created a short-lived independent state in Britain.

Born in Menapia, a district between the Scheldt and Meuse rivers (now in Belgium), Carausius was a pilot by profession. He had won honour in the Roman war against the Bagaudae. About AD 285, Maximian, coruler with the emperor Diocletian, had assembled a naval force to counter the Franks and Saxons who were then plundering the coasts of Spain and Gaul. Carausius was given command of this fleet, which was based at Gesoriacum (modern Boulogne).

Apparently Carausius would wait until after the pirates had carried out raids, then attack the pirates and seize their cargoes for himself. Enraged by this, Maximian ordered Carausius' death, but Carausius quickly escaped with his troops into Britain, where he set himself up as ruler, with the title of Augustus. He trained the local barbarians as sailors and soon controlled the western sea.

Very little is known of Carausius' character. He was, of course, maligned by imperial chroniclers. Diocletian and Maximian failed in several attempts to dislodge him and were temporarily forced to acknowledge him as ruler of Britain, probably in 290. Carausius was slain by his own chief officer, Allectus, in 293.

Caravaca de la Cruz, city, in the *provincia* and *comunidad autónoma* ("autonomous community") of Murcia, southeastern Spain, about 40 miles (65 km) west-northwest of Murcia city.

The city's churches include El Salvador (16th century), designed by Juan de Herrera, and La Santísima Cruz (1617), which once housed the miraculous Cross of Caravaca. Given to the Knights Templar by Ferdinand III of Castile, who took it from the Moors in 1241, Caravaca later passed to the military Order of Santiago. The city is now a centre of footwear manufacturing and also produces textiles, brandy, and chocolate. Pop. (2001) 22,963.

Caravaggio, byname of MICHELANGELO MERISI (b. 1571?, Milan? [Italy]—d. July 18, 1610, Port'Ercole, Tuscany), Italian painter whose revolutionary technique of tenebrism, or dramatic, selective illumination of form out of deep shadow, became a hallmark of Baroque painting. Scorning the traditional idealized interpretation of religious subjects, he took his models from the streets and painted them realistically. His three paintings of St. Matthew (c. 1597-1602) caused a sensation and were followed by such masterpieces as "The Supper at Emmaus" (1596-98) and "Death of the Virgin" (1605-06).

Early life. Caravaggio was the son of Fermo Merisi, steward and architect of the Marquis of Caravaggio. Orphaned at age 11, Caravaggio was apprenticed in the same year to the painter Simone Peterzano of Milan.

At some time between 1588 and 1592, Caravaggio went to Rome. He was already in possession of the fundamental technical skills

"The Deposition of Christ," oil on canvas by Caravaggio, 1602–04; in the Vatican Museum
Scala/Art Resource New York City

Major Roman commissions. With these works realism won its battle with Mannerism, but it is in the cycle of the life of St. Matthew in the Contarelli Chapel that Caravaggio's realistic naturalism first fully appears. Probably through the agency of Del Monte, Caravaggio obtained, in 1597, the commission for the decoration of the Contarelli Chapel in the Church of San Luigi dei Francesi in Rome. This commission established him, at the age of 24, as a *pictor celeberrimus*, a "renowned painter," with important protectors and clients. The task was an imposing one. The scheme called for three large paintings of scenes from the saint's life: "St. Matthew and the Angel," "The Calling of St. Matthew," and "The Martyrdom of St. Matthew." The execution (1598–1601) of all three, in which Caravaggio substituted a dramatic contemporary realism for the traditional pictorial formulas used in depicting saints, provoked public astonishment. Perhaps Caravaggio was waiting for this test, on public view at last, to reveal the whole range of his diversity. His novelty in these works not only involves the surface appearance of structure and subject but also the sense of light and even of time. The first version of the canvas that was to go over the altar, "St. Matthew and the Angel," was so offensive to the canons of San Luigi dei Francesi, who had never seen such a representation of a saint, that it had to be redone. In this work the evangelist has the physical features of a plowman or a common labourer. His big feet seem to stick out of the picture, and his posture, legs crossed, is awkward almost to the point of vulgarity. The angel does not stand graciously but forcefully pushes Matthew's hand over the page of a heavy book, as if he were guiding an illiterate. What the canons did not understand was that Caravaggio, in elevating this humble figure, was copying Christ, who had himself raised Matthew from the street.

The other two scenes of the St. Matthew cycle are no less disconcerting in the realism of their drama. "The Calling of St. Matthew" shows the moment at which two men and two worlds confront each other: Christ, in a burst of light, entering the room of the toll collector, and Matthew, intent on counting coins in the midst of a group of gaily dressed idlers with swords at their sides. In the glance between the two men, Matthew's world is dissolved. In "The Martyrdom of St. Matthew" the event is captured just at the moment when the executioner is forcing his victim to the ground. The scene is a public street, and, as Matthew's acolyte flees in terror, passersby glance at the act with idle unconcern. The most intriguing aspect of these narratives is that they seem as if they were being performed in thick darkness when a sudden illumination revealed them and fixed them in memory at the instant of their most intense drama.

Caravaggio's three paintings for the Contarelli Chapel not only caused a sensation in Rome but also marked a radical change in his artistic preoccupation. Henceforth he would devote himself almost entirely to the painting of traditional religious themes, to which, however, he gave a whole new iconography and interpretation. He often chose subjects that are susceptible to a dramatic, violent, or macabre emphasis, and he proceeded to divest them of their idealized associations, taking his models from the streets. Caravaggio may have used a lantern hung to one side in his shuttered studio while painting from his models. The result in his paintings is a harsh, raking light that strikes across the composition, illuminating parts of it while plunging the rest into deep shadow. This dramatic illumination heightens the emotional tension, focuses the details, and isolates the figures, which are usually placed in the foreground of the picture in a deliberately casual grouping. This insistence on clarity and concentration, together with the firm and vigorous drawing of the figures,

links Caravaggio's mature Roman works with the classical tradition of Italian painting during the Renaissance.

The decoration of the Contarelli Chapel was completed by 1602. Caravaggio, though not yet 30, overshadowed all his contemporaries. There was a swarm of orders for his pictures, private and ecclesiastical. "The Crucifixion of St. Peter" (1601) and "The Conversion of St. Paul" (both in Santa Maria del Popolo, Rome), "The Deposition of Christ" (1602–04; Vatican Museum, Rome), and the "Death of the Virgin" (1605–06; Louvre Museum, Paris) are among the monumental works he produced at this time. Some of these paintings, done at the high point of Caravaggio's artistic maturity, provoked violent reaction. The "Madonna with Pilgrims," or "Madonna di Loreto" (1603–06), for the Church of San Agostino, was a scandal because of the "dirty feet and torn, filthy cap" of the two old people kneeling in the foreground. The "Death of the Virgin" was refused by the Carmelites because of the indignity of the Virgin's plebeian features, bared legs, and swollen belly. At the advice of the painter Peter Paul Rubens, the picture was bought by the Duke of Mantua in April 1607 and displayed to the community of painters at Rome for one week before removal to Mantua.

Culmination of mature style. Artists, men of learning, and enlightened prelates were fascinated by the robust and bewildering art of Caravaggio, but the negative reaction of church officials reflected the self-protective irritation of academic painters and the instinctive resistance of the more conservative clergy and much of the populace. The more brutal aspects of Caravaggio's paintings were condemned partly because Caravaggio's common people bear no relation to the graceful suppliants popular in much of Counter-Reformation art. They are plain working men, muscular, stubborn, and tenacious.

Criticism did not cloud Caravaggio's success, however. His reputation and income increased, and he began to be envied. The despairing bohemian of the early Roman years had disappeared, but, although he moved in the society of cardinals and princes, the spirit was the same, still given to wrath and riot.

The details of the first Roman years are unknown, but after the time of the Contarelli project Caravaggio had many encounters with the law. In 1600 he was accused of blows by a fellow painter, and the following year he wounded a soldier. In 1603 he was imprisoned on the complaint of another painter and released only through the intercession of the French ambassador. In April 1604 he was accused of throwing a plate of artichokes in the face of a waiter, and in October he was arrested for throwing stones at the Roman Guards. In May 1605 he was seized for misuse of arms, and on July 29 he had to flee Rome for a time because he had wounded a man in defense of his mistress. Within a year, on May 29, 1606, again in Rome, during a furious brawl over a disputed score in a game of tennis, Caravaggio killed one Ranuccio Tomassoni.

Flight from Rome. In terror of the consequences of his act, Caravaggio, himself wounded and feverish, fled the city and sought refuge on the nearby estate of a relative of the Marquis of Caravaggio. He then moved on to other places of hiding and eventually reached Naples, probably in early 1607. He remained at Naples for a time, painting a "Madonna of the Rosary" for the Flemish painter Louis Finson and one of his late masterpieces, "The Seven Works of Mercy," for the Chapel of Monte della Misericordia. It is impossible to ignore the connection between the dark and urgent nature of this painting and what must have been his desperate state of mind. It is

of painting and had acquired, with characteristic eagerness, a thorough understanding of the approach of the Lombard and Venetian painters, who, opposed to idealized Florentine painting, had developed a style that was nearer to representing nature and events. Caravaggio arrived in Rome and settled into the cosmopolitan society of the Campo Marzio. This decaying neighbourhood of inns, eating houses, temporary shelter, and little picture shops in which Caravaggio came to live suited his circumstances and his temperament. He was virtually without means, and his inclinations were always toward anarchy and against tradition.

These first five years were an anguishing period of instability and humiliation. According to his biographers, Caravaggio was "needy and stripped of everything" and moved from one unsatisfactory employment to another, working as an assistant to painters of much smaller talent. He earned his living for the most part with hackwork and never stayed more than a few months at any studio. Finally, probably in 1595, he decided to set out on his own and began to sell his pictures through a dealer, a certain Maestro Valentino, who brought Caravaggio's work to the attention of Cardinal Francesco del Monte, a prelate of great influence in the papal court. Caravaggio soon came under the protection of Del Monte and was invited to receive board, lodging, and a pension in the house of the cardinal.

Despite spiritual and material deprivations, Caravaggio had painted up to the beginning of Del Monte's patronage about 40 works. The subjects of this period are mostly adolescent boys, as in "Boy with a Fruit Basket" (1593; Borghese Gallery, Rome), "The Young Bacchus" (1593; Uffizi Gallery, Florence), and "The Music Party" (Metropolitan Museum of Art, New York). These early pictures reveal a fresh, direct, and empirical approach; they were apparently painted directly from life and show almost no trace of the academic Mannerism then prevailing in Rome. The felicitous tone and confident craftsmanship of these early works stand in sharp contrast to the daily quality of Caravaggio's disorderly and dissipated life. In "Basket of Fruit" (1596; Pinacoteca Ambrosiana, Milan) the fruits, painted with brilliance and vivid realism, are handsomely disposed in a straw basket and form a striking composition in their visual apposition.

also the first indication of a shift in his painting style.

At the end of 1607 or the beginning of 1608, Caravaggio traveled to Malta, where he was received as a celebrated artist. He worked hard, completing several works, the most important of which was "The Beheading of St. John the Baptist" for the cathedral in Valletta. In this scene of martyrdom, shadow, which in earlier paintings stood thick about the figures, is here drawn back, and the infinite space that had been evoked by the huge empty areas of the earlier compositions is replaced by a high, overhanging wall. This high wall, which reappears in later works, can be linked to a consciousness in Caravaggio's mind of condemnation to a limited space, the space between the narrow boundaries of flight and prison. On July 14, 1608, Caravaggio was received into the Order of Malta as a "Knight of Justice"; soon afterward, however, either because word of his crime had reached Malta or because of new misdeeds, he was expelled from the order and imprisoned. He escaped, however.

Caravaggio took refuge in Sicily, landing at Syracuse in October 1608, restless and fearful of pursuit. Yet his fame accompanied him; at Syracuse he painted his late, tragic masterpiece, "The Burial of St. Lucy," for the Church of Santa Lucia. In early 1609 he fled to Messina, where he painted "The Resurrection of Lazarus" and "The Adoration of the Shepherds" (both now in the National Museum, Messina), then moved on to Palermo, where he did the "Adoration with St. Francis and St. Lawrence" for the Oratorio di San Lorenzo. The works of Caravaggio's flight, painted under the most adverse of circumstances, show a subdued tone and a delicacy of emotion that is even more intense than the overt dramatics of his earlier paintings.

His desperate flight could be ended only with the pope's pardon, and Caravaggio may have known that there were intercessions on his behalf in Rome when he again moved north to Naples in October 1609. Bad luck pursued him, however; at the door of an inn he was attacked and wounded so badly that rumours reached Rome that the "celebrated painter" was dead. After a long convalescence he sailed in July 1610 from Naples to Rome, but he was arrested enroute when his boat made a stop at Palo. On his release, he discovered that the boat had already sailed, taking his belongings. Setting out to overtake the vessel, he arrived at Port'Ercole, a Spanish possession within the Papal States, and he died there a few days later, probably of pneumonia. A document granting him clemency arrived from Rome three days after his death.

Influence. The many painters who imitated Caravaggio's style soon became known as Caravaggisti. Caravaggio's influence in Rome itself was remarkable but short-lived, lasting only until the 1620s. His foremost followers elsewhere in Italy were Orazio Gentileschi, Artemisia Gentileschi, and the Spaniard José de Ribera. Outside Italy, the Dutch painters Hendrick Terbrugghen, Gerrit van Honthorst, and Dirck van Baburen made the city of Utrecht the foremost northern centre of Caravaggism. The single most important painter in the tradition was the Frenchman Georges de La Tour, though echoes of Caravaggio's style can also be found in the works of such giants as Rembrandt van Rijn and Diego Velázquez.

BIBLIOGRAPHY. Important studies of both his life and his paintings include Bernard Berenson, *Caravaggio: His Incongruity and His Fame* (1953); Walter Friedlaender, *Caravaggio Studies* (1955, reissued 1974); R.P. Hinks, *Michelangelo Merisi da Caravaggio: His Life, His Legend, His Works* (1953); Giuseppe Delogu, *Caravaggio* (1962); Al-

fred Moir, *Caravaggio* (1982); Howard Hibbard, *Caravaggio* (1983), a synthesis of recent scholarship; and Richard E. Spear, *Caravaggio and His Followers*, rev. ed. (1975), on the artist's influence on 17th-century European painting.

caravan, a group of merchants, pilgrims, or travelers journeying together, usually for mutual protection in deserts or other hostile regions. In the deserts of Asia and northern Africa, the animal most commonly used in caravans was the camel, because of its catholic appetite, its ability to go without water for several days, and its loading capacity. In some areas the camel was harnessed to a cart (as was the case in the tea trade between Kalgan in China and Kyakhta in Mongolia), but usually the load was divided into two parts and secured on either side of the camel's back. In hot weather, on a long journey, a camel characteristically carried about 350 pounds (160 kg); but, on shorter journeys, in cooler weather, or in order to evade customs duties, the animal's load might be increased to 1,000 pounds. Passengers were carried in panniers slung one on each side of the camel.

The size of the caravan was dependent upon the amount of traffic, the insecurity of the route, and the availability of camels. The largest recorded caravans were those for special purposes, such as the Muslim pilgrim caravans from Cairo and Damascus to Mecca, which might include over 10,000 camels, or the trans-Saharan salt caravans from Taoudenni to Timbuktu or Bilma or Air. Even in its decline in 1908 this latter caravan numbered 20,000 camels.

Ropes, passed through the nose ring and tied to the saddle of the camel in front, were used to fasten the camels together in strings of up to 40. Three or four strings might travel abreast, as was usual with nomad drivers, or the whole caravan might travel in one long line, as in some Chinese caravans.

The timing of caravans was governed by the availability of water and pasture or, in the case of the Muslim pilgrim caravans, by the need to be in Mecca on the 8th day of the month of Dhū al-Hijjah. Consequently the Orenburg caravan left Bukhara after the melting of the Russian winter snows, and the Basra caravan left Aleppo after the Middle Eastern rains of late autumn. In progress, a caravan averaged 2-3 miles (3-5 km) per hour for 8 to 14 hours each day or, in hot weather, each night. If possible, it was arranged to stop at a caravansary (*q.v.*), which usually consisted of a courtyard, surrounded on all sides by a number of small rooms on an elevation, with stables or store-rooms underneath.

Although the opening of the sea routes from Europe to the East was partly responsible for the decline of certain routes (such as the great Silk Road from China to the Mediterranean), several important caravan routes yet flourished until the 19th century, when road and rail transport and the abolition of the slave trade resulted largely in their demise. Some local caravans still survive in the absence of alternative transport, and certain others because of some particular appeal or advantage. Some of the Muslim pilgrim caravans continue, for example, because it is regarded as more meritorious to travel the hard traditional route.

Caravanche (Slovenia-Austria): see Karawanken.

caravansary, also spelled CARAVANSERAI, in the Middle East, a public building used for sheltering caravans and other travelers. A caravansary is usually constructed outside the walls of a town or village. The structure is quadrangular in form and is enclosed by a massive wall which has small windows near the top and only a few narrow air holes near the bottom. A heavy-doored gateway, high and wide enough to admit loaded camels, is the sole entrance; it can be secured from within by

massive iron chains, which are drawn across it at night.

Inside, the ground floor consists of a central court surrounded by a cloisterlike arcade, which is in turn surrounded by cellular store-rooms. The ground floor is connected by broad, open, stone stairways to a second story that is ringed by a somewhat lighter arcade, which gives access to many small rooms. The ground floor is used for storing the bales of merchandise or stabling the camels, and meals are cooked in the corner of the quadrangle; upstairs rooms are for lodging. The central court is paved with flagstones and is usually large enough to contain 300 or 400 crouching camels or tethered mules. The court is open to the sky and has a well with a fountain basin in its centre.

Neither food nor provender are supplied in a caravansary, but a porter appointed by the municipal authority is always present, lodged just within the gate. He and his assistants guard the building and the goods and persons within it and have the right to maintain order there. The caravansary is always kept open for all arrivals from early dawn until late in the evening. Some caravansaries are of modest architectural merit, with well-hewn, massive walls and impressive proportions. Their gates are often decorated with intricate carving, as is the prayer niche within.

Caravansary near Alanya, Tur.
V.DIA—SCALA from Art Resource

Khans are often confused with caravansaries, but these places are analagous to inns and hotels, where not only lodging but food and other comforts may be had for payment. Khans are generally located within the town or village precincts, provide more elaborate lodgings, and are much smaller than caravansaries.

caravel, a light sailing ship of the 15th, 16th, and 17th centuries in Europe, much-used by the Spanish and Portuguese for long voyages. Apparently developed by the Portuguese for exploring the coast of Africa, the caravel's chief excellence lay in its capacity for sailing to windward. It was also capable of remarkable speed. Two of the three ships in which Christopher Columbus made his historic voyage in 1492 were caravels, the *Niña* and the *Pinta*.

The design of caravels underwent changes over the years, but a typical caravel of the late 15th century may be described as a broad-beamed vessel of 50 or 60 tons burden; some were as large as 160 tons. About 75 feet (23 m) long, the typical caravel had two or three pole masts, lateen-rigged (*i.e.*, with triangular sails). Later versions added a fourth mast with square sail for running before the wind. Caravels were usually built with a double tower at the stern (the aftercastle, or sterncastle) and a single tower in the bow (the forecastle). As a type, caravels were smaller and lighter than the Spanish galleons of the 16th century.

In later years the term caravel was applied to small fishing boats along the coast of France and to a Turkish man-of-war.

caraway, the dried fruit, commonly called seed, of *Carum carvi*, a biennial herb of the parsley family (Apiaceae, or Umbelliferae),

native to Europe and western Asia and cultivated since ancient times. Caraway has a distinctive aroma reminiscent of anise and a warm, slightly sharp taste. It is used as a seasoning in meat dishes, breads, and cheese and in such vegetables as sauerkraut and cabbage. Caraway of The Netherlands has traditionally had a reputation for high quality.

Caraway (*Carum carvi*)
Walter Dawn

The plant has finely cut leaves and compound umbels of small white flowers. The fruit, or seed, light to dark brown in colour, is a crescent about 0.2 inch (5 mm) long with five prominent longitudinal dorsal ridges.

The essential oil content is about 5 percent; *d*-carvone and *d*-limonene are the principal components. The oil is used to flavour alcoholic beverages, notably aquavit and k ummel, and in medicine as an aromatic stimulant and carminative.

Caraway, Hattie Ophelia, n e WYATT (b. Feb. 1, 1878, near Bakerville, Tenn., U.S.—d. Dec. 21, 1950, Falls Church, Va.), American politician who became the first woman elected to the U.S. Senate.

In 1902 she married the lawyer Thaddeus H. Caraway, who subsequently became a congressman and then a U.S. senator for Arkansas. When he died in 1931, his widow was appointed to his seat by the state's governor, and she subsequently won a special election (January 1932) to fill the few remaining months of her late husband's term. She won reelection in her own right to the seat later in 1932 with the help of Louisiana governor Huey Long, who campaigned for her. Caraway was reelected again in 1938 but failed in her bid for a third term in 1944. In her 13 years in the Senate, she was the first woman to preside over a session of that body and the first to serve as a committee chairman. She supported prohibition, labour unions' and women's rights, and most of the New Deal legislation.

carbamide (chemistry): *see* urea.

carbanion, any member of a class of organic compounds in which a negative electrical charge is located predominantly on a carbon atom. Carbanions are formally derived from neutral organic molecules by removal of positively charged atoms or groups of atoms, and they are important chiefly as chemical intermediates—that is, as substances used in the preparation of other substances. Important industrial products, including useful plastics, are made using carbanions.

The simplest carbanion, the methide ion (CH_3^-), is derived from the organic compound methane (CH_4) by a loss of a proton (hydrogen ion, H^+) as shown in the following chemical equation:

in which the symbols C and H represent, respectively, carbon and hydrogen atoms; the subscripts indicate the numbers of atoms of

each kind included in the molecules; the superscript plus and minus signs indicate, respectively, positive and negative charges; and the double arrows indicate that the reaction shown can proceed in either the forward or the reverse direction, a condition known as reversibility.

Molecular structures. In discussing the structures of carbanions, one must distinguish between localized and delocalized ions. In the former, the negative charge is confined largely to one carbon atom, whereas, in the latter, it is distributed over several atoms.

Localized ions. The simplest localized carbanion is the methide ion (CH_3^-). It is isoelectronic (it has identical electron configuration) with the neutral molecule ammonia (formula NH_3 , N being the chemical symbol for the nitrogen atom). The geometry of the methide ion is best represented by a pyramid with the carbon atom at the apex, a structure similar to that of the ammonia molecule. Both structures are shown below:

in which the solid lines represent bonds between atoms and the dotted lines merely indicate the bases of the pyramids.

Delocalized ions. The allyl carbanion (formula, C_3H_5^-), a somewhat more elaborate unit than the methide ion, serves as the prototype for the structures of delocalized carbanions. It is derived from the substance propene by loss of a proton, as shown in the equation below, and its structure is best characterized by the "resonance" relationship expressed by the two formulas enclosed within square brackets:

A substance (like the allyl carbanion), whose structural formula is expressed in terms of separate resonance forms, is considered to have a hybrid structure similar to all the resonance forms but truly expressed by none of them alone.

An additional example of this kind of carbanion is the benzylic anion (shown below), in which the negative charge can be distributed over a much more extended pi-bond system, which includes an aromatic ring (a circle of carbon atoms joined by sigma and pi bonds). A resonance formulation of this anion is given below:

Closely related to the allyl carbanion are the enolate anions, in which one of the carbon atoms is replaced by an oxygen atom. Enolate ions are derivatives of ketones and aldehydes

(compounds containing a double bond between carbon and oxygen atoms), from which they can be generated by abstraction of a proton from the carbon atom that is located next to the carbon of the carbonyl group. The resonance forms of an enolate ion are as depicted below:

Because of the greater attraction for electrons (electronegativity) of oxygen as compared to carbon, the resonance structure with negative charge on oxygen contributes more than half to the true representation of the compound. In a typical enolate ion, in other words, the oxygen atom bears more of the negative charge than the carbon atom.

Ion pairs. In a solution containing carbanions there must exist a corresponding cation (positive ion) for each carbanion. If the two ions of opposite charge are in close contact with each other, a covalent (nonionic) bond may form. This reaction is represented by the equilibrium that follows:

in which M in most cases is a metal atom. Because for a given carbanion the reaction of ionization is favoured by a low electron affinity of the cation, the largest carbanion character of such a compound is exhibited when the atom M is an alkali metal—lithium, sodium, potassium, cesium, or rubidium. Even in cases in which the tendency to form covalent bonds is negligible, however, the properties of free carbanions cannot always be observed. This situation arises from the fact that there is a strong attraction between the cation and the anion, leading to the pairing of these ions of opposite charge. The resulting "tight" ion pairs can be broken up only if the interactions of the individual ions with the solvent are large enough to overcome the attraction between the ions. Therefore, only in solvents that strongly solvate at least one type of the ions can free carbanions be observed. Examples of solvents with strong tendencies to solvate the cations are ethers and dimethyl sulfoxide. In general, the energy needed to separate ion pairs is larger when the charge on the anion is localized than when it is delocalized. In fact, if the carbanion is derived from a simple alkane compound of carbon and hydrogen, as for example the methide ion (above), no common solvent exists that provides enough solvation energy to separate the ion pairs and that is, at the same time, inert to chemical reaction with the anion. Therefore, alkyl alkali-metal compounds do not dissociate to free ions, and their properties are characteristic of the ion pairs only.

Preparation Any preparation of organic-alkali-metal compounds is a source of carbanions. The reaction of organic compounds containing atoms of chlorine, bromine, or iodine with alkali metals is one of the most often used methods. This reaction can be expressed:

in which R is an organic group; X is an atom of chlorine, bromine, or iodine; and M is an atom of an alkali metal.

The conversion of one carbanion into another can be accomplished with either hydrocarbons or organic halides, as shown by the equations below:

Reactions. Perhaps the most common reaction of carbanions is their action as bases—as shown in the first equation in this article. It is useful to redefine this acid-base equilibrium by the equation:

in which Y is a proton acceptor (base).

Consideration of carbanion formation in terms of such an equilibrium makes it possible to assign a numerical value to the basicity (proton-attracting power) of the carbanion. This is done by determining an equilibrium constant for the equilibrium reaction above; the equilibrium constant is the ratio

$$K_a = \frac{\left[\begin{array}{c} | \\ -\text{C}^- \\ | \end{array} \right] \left[\text{YH}^+ \right]}{\left[\begin{array}{c} | \\ -\text{C}-\text{H} \\ | \end{array} \right] \left[\text{Y} \right]}$$

in which K_a is the acid equilibrium constant, and the terms in square brackets are the concentrations of the enclosed entities. For convenience equilibrium constants are frequently converted to another quantity, the acidity exponent, which is almost invariably referred to by its symbolic representation, pK_a . The pK_a is the negative logarithm of the equilibrium constant, or mathematically, $pK_a = -\log K_a$. For a given base (Y), increasing basicity of a carbanion is reflected in a decreasing equilibrium constant (K_a) and an increasing pK_a .

The pK_a 's of most carbon acids range from approximately 15 to above 40, indicating that carbanions are much stronger bases than water (which has a pK_a of 15.7). The large variation in pK_a among the different carbon acids reflects the varying degree of internal stabilization in the corresponding carbanions. Generally, three different mechanisms of sta-

bilizing carbanions have been recognized. The first is the already mentioned stabilization by resonance. Examples of resonance-stabilized carbanions are the allyl and benzyl carbanions, each of which has a pK_a of about 35. Particularly large resonance stabilization is encountered in the cyclopentadienyl anion (pK_a about 15), which has an aromatic pi electron system not present in the corresponding hydrocarbon, as shown below:

cyclopentadienyl anion

A second factor lending stability to carbanions is the inductive (electron-withdrawing) effect of neighbouring electronegative atoms. An example is provided by the comparison of the pK_a 's of methane (formula, CH_4), pK_a about 40, and chloroform (CHCl_3), pK_a less than 25. The greater stability of the trichloromethide ion,

trichloromethide ion

which results from removal of a proton from chloroform, can be understood in terms of the inductive effect of the chlorine atoms, which reduces the free charge on carbon and distributes it to the chlorine atoms.

The third effect is based on a change in electronegativity of the carbon atom carrying the negative charge. An example of this effect is the sequence of decreasing pK_a 's from ethane through ethylene to acetylene (the respective pK_a 's being 42, 36, and 25). In the corresponding carbanions, shown below, the negative charge resides on carbon atoms that are, respectively, sp^3 , sp^2 , and sp hybridized.

Since the electronegativity of the carbon increases with increasing s -character of the bonding (that is, in the order sp^3 , sp^2 , and sp) the carbanion stability follows the same trend.

A type of reaction that makes carbanions valuable synthetic intermediates is their ability to function as nucleophiles (positive-charge seeking groups) in displacement reactions. Methylsodium, for example, reacts with methyl bromide to give ethane, as follows:

This reaction type is extensively used for the alkylation of ketones. In the process, the ketones are first converted into their enolate ions and then alkylated with a suitable alkyl halide, as in the example below:

Another synthetically useful reaction is the addition of carbanions to carbonyl groups; for example, methyl lithium adds to acetone to give lithium *tert*-butoxide, as shown

carbene, any member of a class of highly reactive molecules containing divalent carbon atoms—that is, carbon atoms that utilize only two of the four bonds they are capable of forming with other atoms. Occurring usually as transient intermediates during chemical reactions, they are important chiefly for what they reveal about chemical reactions and molecular structure. In addition, some chemical compounds, particularly those in which the molecules contain carbon atoms arranged in small rings, can best be prepared by the use of carbenes.

According to the electronic theory of bonding, bonds between atoms are formed by a sharing of electrons. In terms of this theory, then, a carbene is a compound in which only two of the four valence, or bonding, electrons of a carbon atom are actually engaged in bonding with other atoms. By contrast, in multiple bonded compounds, such as hydrogen cyanide, all four of the valence electrons of the atoms are involved in bonds with other atoms. Because there is no excess or deficiency of electrons in the molecules of carbenes, they are electrically neutral (nonionic).

Early investigations. Because of the great reactivity of carbenes, they normally have very short lifetimes, and it is not surprising, therefore, that unambiguous and direct experimental evidence of their existence has been obtained only recently. Divalent carbon

Nonbonding orbitals in the (A) triplet and (B) singlet state of methylene; the axis of the shaded orbital is perpendicular to the plane defined by the carbon atom (C), the hydrogen atoms (H), and the unshaded orbital

compounds had been postulated, however, as long ago as 1876, when it was proposed that dichlorocarbene, $\text{Cl}-\text{C}-\text{Cl}$, was an intermediate in the base-catalyzed hydrolysis (decomposition brought about by water) of chloroform (HCCl_3). Toward the end of the 19th century, an extensive theory had been developed that postulated divalent carbon compounds as intermediates in many reactions. Later work, however, disproved many of these postulates, and, as a result, carbenes were no longer put forward as hypothetical reaction intermediates. Carbene chemistry revived in the 1950s after unambiguous evidence had demonstrated their existence and studies by several methods had yielded detailed information about their structures.

Electronic configuration and molecular structure. The theory of chemical bonding predicts two fundamentally different electron configurations for carbenes, either one of which may correspond to the ground state of the molecules (state of lower energy content) depending only on the nature of the atoms and groups attached to the divalent carbon atom. This duality arises from the fact that the two bonds of the carbene utilize only two of the four valence orbitals on carbon— orbitals being the regions occupied by the various electrons in an atom. The two valence orbitals of the carbon atom not used in bonding are available to accept the two nonbonding electrons. In general, each orbital can accommodate two electrons if their spins are paired—that is, if the angular momenta are of opposite sign. There are thus two possible distributions of the nonbonding electrons: they may be in the same orbital and have paired (opposite) spins, or they may be divided between the two available orbitals and have parallel spins. Substances with electrons having parallel (or unpaired) spins show a magnetic effect (moment). In a magnetic field this moment may be parallel, perpendicular, or antiparallel (parallel but proceeding in the reverse direction) to the direction of the field; these three possible alignments correspond to three forms of slightly different energy, and, as a result, substances with unpaired electrons can exist in all three forms and are said to be in a triplet state. By contrast, substances with all electrons paired show no net magnetic moment and are referred to as singlet states. In principle, carbenes can exist in either the singlet or triplet state (depending upon whether the electrons are in the same or different orbitals, respectively).

In most organic compounds (compounds of carbon), the singlet state is more stable than the triplet state, and the normal or ground state of the molecule is of this form. In these compounds triplets occur only as excited or high-energy states. In carbenes, on the other hand, because of the two nonbonding electrons and the two vacant orbitals, it is expected on theoretical grounds that the triplet state should be of comparable stability to the singlet state and may, in fact, be the ground state.

Theoretical considerations also suggest that the carbene carbon atom and the two atoms joined to it are arranged in a "V" rather than in a linear fashion—that is, the bonds from the carbon atom to the two substituent atoms are situated at an angle that is less than 180° — in both the triplet and the singlet states. The bond angle for the singlet state, however, is predicted to be larger than that for the triplet state. These predictions are fully supported by experiments. The simplest carbene, methylene, has been shown by a technique called electron magnetic resonance spectroscopy to have a triplet ground state, in which the angle between the carbon-hydrogen bonds equals 136° . The singlet state of methylene, which can be obtained in special circumstances, has been studied by another technique, optical spectroscopy, and its bond angle has been de-

termined to be 104° . The structures and the configurations of the nonbonding electrons of the triplet and singlet states of methylene are shown as A and B in the accompanying drawing; the loops represent the orbitals not used in bonding, and the pairing and nonpairing of electron spins are indicated by antiparallel and parallel arrows, respectively. This schematic orbital representation shows both nonbonding orbitals occupied in A (the triplet state) and an empty orbital in B (singlet).

The structural features that determine whether a singlet or a triplet state corresponds to the lower energy form of the carbene molecule may be summarized by the rule that, with few exceptions, carbenes having only carbon or hydrogen atoms attached to the divalent (carbene) carbon atom have triplet ground states, whereas those with nitrogen, oxygen, and halogen substituents have singlet ground states. Examples of triplet carbenes are methylene ($\text{H}-\text{C}-\text{H}$), phenylmethylene ($\text{C}_6\text{H}_5-\text{C}-\text{H}$), diphenylmethylene ($\text{C}_6\text{H}_5-\text{C}-\text{C}_6\text{H}_5$), and propargylene ($\text{HC}\equiv\text{C}-\text{C}-\text{H}$). Carbenes with known singlet ground states are methoxymethylene ($\text{CH}_3\text{O}-\text{C}-\text{H}$), chloromethylene ($\text{Cl}-\text{C}-\text{H}$), and phenylchloromethylene ($\text{C}_6\text{H}_5-\text{C}-\text{Cl}$).

Formation. Because carbenes are molecules with high energy content, they must be made from high-energy precursors, or extra energy must be provided from external sources. Chemical transformations induced by light, so-called photochemical reactions, often are used to prepare carbenes, because the energy of the absorbed light is taken into the high-energy structures. Organic compounds containing a diazo group (two nitrogen atoms joined to one another and to a carbon atom by a double bond) are the most frequently used precursors of carbenes. The molecular structure of diazo compounds is represented by the generalized formula

in which R and R' represent two organic groups, which may be the same or different. On either photolysis or pyrolysis (treatment with light or heat, respectively), diazo compounds cleave to yield the corresponding carbene and a free molecule of nitrogen gas. Diazirins, which are ring, or cyclic, compounds, with a structure similar to that of the diazo compounds, undergo the same cleavage reaction and are frequently used as precursors of carbenes. The production of a carbene from a diazo compound occurs as shown below:

When the photolysis of diazo compounds is carried out at very low temperature in an unreactive solid medium, it is often possible to prevent the resulting carbene from undergoing further reaction. Measurable amounts of the carbene may persist, therefore, in the solid medium, or matrix, for a long time. For example, methylene, the most reactive carbene of all, has been generated in a crystalline matrix of the inert gas xenon (cooled to the boiling point of helium) in which it persisted long enough to be studied. Many other carbenes have been produced by similar matrix isolation techniques.

The photolytic decomposition of certain ketenes, substances the molecules of which contain two carbon atoms and an oxygen atom joined by double bonds,

gives carbon monoxide and carbenes, as shown in the following equation:

Under certain circumstances, cyclopropanes, the molecules of which contain three-membered carbon rings, can serve as carbene precursors in photochemical reactions. For example, 1,1,2,2-tetraphenylcyclopropane is converted to diphenylcarbene by the reaction

1,1,2,2-tetraphenylcyclopropane

1,1-diphenylethylene diphenylcarbene

The formation of carbenes by way of electrically charged, or ionic, intermediates is exemplified by the reaction of chloroform with a strong base, potassium *tert*-butoxide. In the first step of this reaction, a proton or hydrogen ion (H^+) is removed from the chloroform molecule in a normal acid-base reaction. The resulting potassium trichloromethide then loses potassium chloride to give dichlorocarbene. Other haloforms, compounds conforming to the formula HCX_3 , in which X equals an atom of chlorine, bromine, or iodine, react in an equivalent way to form the corresponding dihalocarbenes.

Reactions. Methylene is one of the most reactive molecules known and there are few organic compounds able to resist attack by this substance. The reactivity of carbenes is somewhat reduced when stabilization results from the phenomenon known as resonance, which is said to occur when alternate electronic structures (called resonance forms) can be written for a single molecular type. The actual state of the molecule is then thought to include characteristics of all the forms and to be more stable than any of them individually. Difluorocarbene and methoxycarbene, for example, are much less reactive than methylene, presumably because the resonance forms shown in the formulas below contribute to internal stabilization.

resonance forms of difluorocarbene

resonance forms of methoxycarbene

In these representations, the various resonance forms of a single hybrid structure are connected by double-headed arrows, and the plus and minus signs indicate positive and negative charges produced by shifts of electrons.

The various chemical reactions that carbenes undergo can be classified as either intramolecular or intermolecular reactions. Intramolecular reactions, or rearrangements, involve only the carbene itself and include no other outside substances; if structurally possible, they lead to stable molecules in which the carbon atom is in its normal, or tetravalent, state. An example of an intramolecular reaction is the rearrangement of methylcarbene to ethylene, in which a hydrogen atom undergoes a shift from one carbon atom to the next:

Such an intramolecular rearrangement, of course, is not possible for carbenes composed of only three atoms, such as methylene itself or the halomethylenes.

Intermolecular reactions are those involving two or more separate molecules. Three important classes of intermolecular reaction of carbenes are known: dimerization, addition, and insertion reactions. Dimerization of carbenes—combination of two molecules of the carbene—gives olefins, the molecular formulas of which are exactly twice that of the carbene. An example is the formation of tetramethoxyethylene from dimethoxycarbene.

The addition of carbenes to olefins and acetylenes is a very useful reaction because it constitutes a simple way to synthesize cyclopropanes and cyclopropenes having a great variety of structures. Intramolecular versions of this type of addition reaction are also possible, as shown by the cyclization of allylcarbene generated from the corresponding diazo compound. The resulting bicyclobutane—an unusual compound, which contains a ring system with considerable strain resulting from abnormal angles between bonds—demonstrates the value of carbene reactions for the synthesis compounds difficult to obtain by other methods.

Analytical and physical study. Because carbenes occur chiefly as intermediates in the course of chemical reactions, much of their study is conducted by kinetic methods, as the general field of investigation of rates of reaction and the factors that influence them is known. Much of the available information about the structures of carbenes has been obtained by optical spectroscopic methods—that is, by the study of light absorption patterns—which have revealed, for example, the bond lengths and angles in the various carbenes. Electron-spin resonance spectroscopy, the physical method that gives information about the angular momenta of electrons, has been especially useful in differentiating triplet from singlet states. (G.L.C.)

Carbet Mountains, French PITONS DU CARBET, volcanic massif on the Caribbean island of Martinique, in the Lesser Antilles, French West Indies. The peaks are about 3½ mi (6 km) from the west coast, standing between Saint-Pierre and Fort-de-France. They include Lacroix (3,924 ft [1,196 m]), Piquet (3,806 ft), Dumauzé (3,638 ft), Alma (3,625 ft), and Boucher (3,510 ft). The massif extends in a northwest to southeast direction for about 50 mi. It is the source of the water that wells up in hot springs at the town of Absalon. An observatory for studying Mt. Pelée (see Pelée, Mount) was built in 1932.

carbide, any of a class of chemical compounds in which carbon is combined with a metallic or semimetallic element. Calcium carbide is

important chiefly as a source of acetylene and other chemicals, whereas the carbides of silicon, tungsten, and several other elements are valued for their physical hardness, strength, and resistance to chemical attack even at very high temperatures. Iron carbide (cementite) is an important constituent of steel and cast iron.

On the basis of their atomic structures, the carbides fall into three groups: ionic (saltlike), interstitial (metallic), and covalent (diamondlike). Metals of groups I, IIa, and IIIB of the periodic table commonly form ionic carbides, pure samples of which are transparent solids that are poor conductors of electricity; treatment with acids—or, in certain cases, even water—decomposes them into hydrocarbons and metal hydroxides. Metallic carbides most often are formed from metals of groups IVb, Vb, VIb, VIIb, and VIII; these compounds are very hard and electrically conductive; several of them, especially tungsten carbide and the carbides of titanium, tantalum, and niobium, are important components of the composite materials called cermets. Boron carbide and silicon carbide (Carborundum) resemble diamond in structure and approach it in hardness; they are highly resistant to chemical attack and are used as abrasives.

Carbides usually are prepared from carbon and either a metal or a metal oxide at temperatures of 1,000°–2,800° C (1,800°–5,100° F); in certain cases, a hydrocarbon or hydrogen is used to reduce a metal oxide or chloride.

carbine, light, short-barrelled musket or rifle. The word, the source of which is obscure, seems to have originated in the late or mid-16th century. The carbine, in various versions corresponding to the different full-sized military arms, was chiefly a cavalry weapon until the 18th century. Then some unmounted officers, artillerymen, and other specialists began to carry carbines. By the 1980s the trend toward general use of light assault rifles (e.g., the Soviet AK-47 or the U.S. M16) was making the carbine obsolete as a military weapon. However, its light weight and short length had long made it a popular sporting arm for hunting in heavy brush and also as a scabbard weapon for horseback use.

Carbo, Gaius Papirius (d. 119 BC), Roman politician who supported the agrarian reforms of Tiberius Sempronius Gracchus but later deserted the Gracchan party.

As tribune in 131, Carbo carried a measure that extended voting by ballot to the enactment and repeal of laws. A year later he became a member of the Gracchan land commission but in 122 left the Gracchans to join their opponents, the Optimates (conservative senatorial aristocracy). His new allies rewarded him with the consulship in 120. Although he successfully defended Lucius Opimius, murderer of the reformer Gaius Gracchus, Carbo was nevertheless mistrusted by the Optimates. He committed suicide after being impeached on a charge of treason or extortion.

Carbo, Gnaeus Papirius (b. c. 130 BC—d. 82, Lilybaeum, Sicily), Roman general, leader of the forces of Gaius Marius in the civil war between Marius and Lucius Cornelius Sulla. In 87 he took part in Marius' blockade of Rome, which was at that time held by pro-Sullan forces. Rome capitulated, and Carbo and Lucius Cornelius Cinna, both consuls in 85, made preparations against the return of Sulla from the east.

Carbo and Cinna illegally declared themselves consuls again for the following year, and Carbo became sole consul when Cinna was murdered by his own soldiers. After fighting an indecisive battle with Sulla near Clusium (modern Chiusi, Italy) in 82, Carbo, then in his third consulate, was defeated by Sulla's general Metellus Pius, near Faventia. He fled but was captured on the island of Cossyra,

south of Sicily, by Pompey (Gnaeus Pompeius), who had him executed.

carbohydrate, any member of a very abundant and widespread class of natural organic substances that includes the sugars, starch, and cellulose. The first carbohydrates analyzed (in the early 19th century) were determined to be composed of carbon (C), along with hydrogen (H) and oxygen (O) in the proportions found in water (H₂O). Many carbohydrates have the general formula C_n(H₂O)_n, but the class is so broad that no simple definition encompasses them all.

A brief treatment of carbohydrates follows. For full treatment, see MACROPAEDIA: Biochemical Components of Organisms.

Several classification schemes have been devised for carbohydrates. One of the most common divides them into four major groups—monosaccharides, disaccharides, oligosaccharides, and polysaccharides. Molecules of monosaccharides, or simple sugars, contain from three to nine carbon atoms, most commonly five or six. Three of the most important simple sugars are glucose (also known as dextrose, grape sugar, or corn sugar), fructose (fruit sugar), and galactose. Two simple-sugar molecules are linked to each other in a disaccharide, or double sugar. The disaccharide sucrose (table sugar) consists of one molecule of glucose and one molecule of fructose. Lactose (milk sugar) and maltose are also disaccharides. Oligosaccharides, which consist of three to six monosaccharide units, are rare. Polysaccharides are large molecules, such as cellulose, starch, and glycogen, in which as many as 10,000 monosaccharide units are linked together. They include most of the structural and storage carbohydrates found in nature.

Green plants utilize the energy of sunlight to convert carbon dioxide and water into carbohydrates. This process, called photosynthesis, releases oxygen into the atmosphere and transforms light energy into the chemical energy of carbohydrates. Plants convert simple carbohydrates into sucrose, which is the sugar in many fruits; cellulose, their principal structural component; starch, which is stored; and a wide variety of other polysaccharides that function as essential structural components.

In most animals, carbohydrates provide a quickly accessible reservoir of energy. Glucose, the sugar circulating in the blood of higher animals, is absorbed by the cells, where its oxidation energizes the metabolic processes. Glycogen, which consists of branching chains of glucose molecules, is stored in the liver and muscles of higher animals, to be broken down into glucose under conditions of stress or muscular activity. In addition, polysaccharides function as structural components in certain animals. For example, chitin, which is similar to cellulose, makes up the exoskeleton of insects and other arthropods.

The names of the monosaccharides combine a prefix that designates the number of carbon atoms in the molecule (e.g., *pent-* means "five" and *hex-* means "six") and the generic suffix *-ose*. Thus, "pentose" denotes any monosaccharide containing five carbon atoms.

When a monosaccharide molecule assumes a straight-chain form, its carbon atoms make up the backbone of the molecule. Attached to most of these carbon atoms are a hydroxyl group (OH) and one hydrogen atom (two if it is a terminal carbon in the chain). The hydroxyl groups account for the great solubility of sugars in water. One carbon atom in the chain differs from the others, however, in that it is linked by means of a double bond to an atom of oxygen. This carbon and its double-bond oxygen form either an aldehyde group (if it occurs at a terminal carbon in the chain) or a ketone group (if it occurs at an internal carbon in the chain). Therefore, monosaccharides are either aldehydes or ketones; these are identified by the prefixes *aldo-*

and *keto-*, as, for example, "aldopentoses" and "ketohexoses." Glucose is an aldohexose, with six carbon atoms and an aldehyde group.

Many carbohydrates are isomers—that is, they have the same atomic composition but different structures. Glucose, fructose, and galactose, for example, are all isomers with a formula of $C_6H_{12}O_6$.

The most common naturally occurring monosaccharides are glucose, mannose, fructose, and galactose among the hexoses, and xylose and arabinose among the pentoses. Two other monosaccharides—ribose and deoxyribose—are found in all cells, where they form the carbohydrate component of ribonucleic acid (RNA) and deoxyribonucleic acid (DNA), respectively. Xylose is prepared from cottonseed hulls, corncobs, or straw by the chemical breakdown of xylan, a polysaccharide. Galactose is a common constituent of oligosaccharides and polysaccharides, such as agar and carrageenan. It also occurs in carbohydrate-containing lipids, called glycolipids, present in the brain and other nerve tissues of most animals. Galactose is generally prepared from lactose, a disaccharide composed of galactose and glucose. Glucose is found in fruits, honey, blood, and, under abnormal conditions, urine. It is also a constituent of the two most common naturally occurring disaccharides, sucrose and lactose, and it is the sole structural unit of the polysaccharides cellulose, starch, and glycogen. Glucose is produced commercially in large amounts by hydrolysis of cornstarch; the largest amount is sold as corn syrup, although its crystalline form is sometimes sold under the name dextrose. Fructose is one of the constituents of the disaccharide sucrose and is also present in uncombined form in honey, apples, and tomatoes. It is produced from sucrose and is used by the food industry. Arabinose can be obtained from plant gums (its name derives from gum arabic) and is a component of pectins. Mannose is obtainable from polysaccharides known as mannans.

Most monosaccharides can be oxidized easily. When a terminal group (CH_2OH) of a monosaccharide is oxidized chemically or biologically, a uronic acid is formed. Glucuronic acid (formed from glucose) is a major component of the polysaccharides in connective tissue; it and other uronic acids are involved in the detoxification of many poisons and their excretion in the urine (hence their name). Sugars may be reduced (by the addition of hydrogen) to alditols, or sugar alcohols. The product thus formed from glucose is sorbitol, commonly used as a sweetening agent.

Sugars in solution (including those inside the cell) assume a ring structure in which a hydroxyl group is attached to the carbon that carries the aldehyde or ketone group. This hydroxyl group is highly reactive, enabling the sugars to react with each other or with other classes of compounds to form derivatives called glycosides; glycosides formed from glucose are called glucosides. Among the wide variety of natural glycosides are plant pigments (*e.g.*, indican), heart-muscle stimulants (*e.g.*, digitalis), antibiotics (*e.g.*, streptomycin), and precursors of flavourings (*e.g.*, vanillin).

In some monosaccharides, one hydroxyl group is replaced by an amino group (NH_2); these compounds, called amino sugars, are widely distributed in nature. In deoxy sugars, one hydroxyl group is replaced by a hydrogen atom; by far the most important of these is deoxyribose, derived from ribose and present in deoxyribonucleic acid (DNA), the carrier of genetic information.

Disaccharides are specialized glycosides in which a molecule of one sugar has combined with a molecule of a second. Among the few disaccharides of commercial or biological significance, the most important are sucrose, trehalose, lactose, and maltose. Sucrose is a disaccharide composed of glucose

and fructose. It is the familiar table sugar of commerce and food preparation; more than 100 million metric tons are produced annually worldwide. Sucrose is obtained commercially by treatment of sugarcane or sugar beet by crushing and extraction with water, purification, and crystallization. Less-pure crystals deposited from the concentrated liquor are known as brown sugar. The residual syrupy material is called cane final molasses, or blackstrap molasses. Trehalose (composed of two glucose molecules) is similar in many respects to sucrose but is much less widely distributed.

Lactose (composed of glucose and galactose) is another of the sugars found most commonly in human diets; it composes about 5 percent of the milk of all mammals. Although not found uncombined in nature, maltose is biologically important as a product of the enzymatic breakdown of starches during digestion. Maltose consists of two molecules of glucose, but it differs structurally from trehalose.

Polysaccharides, or glycans, may be classified in a number of ways. Homopolysaccharides are polysaccharides formed from only one monosaccharide. These may be further subdivided into straight-chain, branched-chain, and cyclic representatives, depending on the arrangement of the monosaccharide units. Heteropolysaccharides contain two or more different monosaccharides; their molecules also may be either linear or branched.

The two best-known polysaccharides, both homopolysaccharides, are cellulose and starch. Cellulose, the basic structural component of most plants, is a large, linear molecule composed of 3,000 or more glucose molecules. Cellulose is used for a wide variety of commercial purposes, including the manufacture of paper and cloth, and is prepared by treating plant material with hot alkali. Similar to cellulose is xylan, which contains xylose units and is also found in plant-cell walls. The term starch denotes a group of plant polysaccharides consisting of glucose units; most starches are composed of a mixture of two components—a linear component (amylose) and a branched component (amylopectin). In humans, utilization of starch requires breaking it into individual glucose units; this process is initiated by enzymes called amylases, which are present in saliva, and continues in the intestinal tract. The product of amylase action is maltose, which is hydrolyzed to glucose as it is absorbed through the walls of the intestine.

Another important homopolysaccharide is glycogen. Found in all animal tissues, it is the primary animal storage form of carbohydrate. Glycogen is made of glucose units; it resembles starch but is more highly branched. Polysaccharides composed of galactose or galacturonic acid—*e.g.*, pectins and agars—are important because they can form gels. Pectins, obtainable from citrus fruit rinds, are used commercially in the preparation of jellies and jams. Agar is widely used in biological laboratories in growth media for microorganisms and in the bakery industry as a gelling agent.

carbolic acid, simplest member of the phenol family of organic compounds. *See* phenol.

carbon (C), a nonmetallic chemical element in Group IVa of the periodic table.

A brief treatment of carbon follows. For full treatment, *see* MACROPAEDIA: Chemical Elements: *Carbon group elements*.

Although widely distributed in nature, carbon is not particularly plentiful (it makes up only about 0.025 percent of the Earth's crust); yet it forms more compounds than all the other elements combined. In 1961 the isotope carbon-12 was selected to replace oxygen as the standard relative to which the atomic weights of all the other elements are measured; carbon-14, which is radioactive, is the isotope used in radiocarbon dating and radiolabeling.

Properties and uses. Elemental carbon exists in three forms, each of which has its own

physical characteristics. Two of the forms, diamond and graphite, are crystalline in structure; but they differ in physical properties because the arrangements of the atoms in their structures are dissimilar. The third form, known as carbon black, is amorphous in structure and includes charcoal, lampblack, coal, and coke, although X-ray examination has revealed that these substances do possess a low degree of crystallinity. Both diamond and graphite can be produced synthetically; they are chemically inert but do combine with oxygen at high temperatures, just as amorphous carbon does.

Pure diamond is the hardest naturally occurring substance known and is a poor conductor of electricity. Graphite, on the other hand, is a soft, slippery solid that is a good conductor of both heat and electricity. Because of their beauty, diamonds are valued as jewels and, because of their hardness, as abrasives for cutting, grinding, and drilling. Graphite is used as a lubricant, in paint, and, mixed with clay, as the "lead" of pencils; because it conducts electricity but does not melt, graphite also is used for electrodes in electric furnaces and dry cells as well as for making crucibles in which metals are melted.

Each of the amorphous forms of carbon has its own special character; hence, each has its own particular applications. All are products of oxidation and other forms of decomposition of organic compounds. Coal and coke, for example, are used extensively as fuels; charcoal is used as an absorptive and filtering agent and as a fuel and in the manufacture of gunpowder. In addition to its uses in making inks, carbon paper, typewriter ribbons, and paints, carbon black also is added to the rubber used in tires to improve its wearing qualities. Bone black, or animal charcoal, can adsorb gases and colouring matter from many other materials; a major use is in decolorizing raw sugar.

Carbon has two stable isotopes, carbon-12 (which makes up 98.89 percent of natural carbon) and carbon-13 (1.11 percent); five radioactive isotopes are known, of which the longest-lived is carbon-14, which has a half-life of $5,730 \pm 40$ years.

Compounds. More than 1,000,000 carbon compounds have been described in chemical literature, and chemists synthesize many new ones each year. Much of the diversity and complexity of organic forms is due to the capacity of carbon atoms for uniting with each other in various chain and ring structures and three-dimensional conformations, as well as for linking with other atoms. Indeed, carbon's compounds are so numerous, complex, and important that their study constitutes a specialized field of chemistry called organic chemistry, which derives its name from the fact that in the 19th century most of the then-known carbon compounds were considered to have originated in living organisms. (*See* chemical compound.)

With hydrogen, oxygen, nitrogen, and a few other elements, carbon forms compounds that make up about 18 percent of all the matter in living things. The processes by which organisms consume carbon and return it to their surroundings constitute the carbon cycle (*q.v.*).

Carbon is present as carbon dioxide in the Earth's atmosphere in amounts of about 0.03 percent by volume, and it is dissolved in all natural waters. Carbon occurs in the crust of the Earth in the form of carbonates in such rocks as marble, limestone, and chalk and in hydrocarbons—the principal constituents of coal, petroleum, and natural gas.

At ordinary temperatures, carbon is very unreactive—it is difficult to oxidize—and it does not react with acids or alkalis. At high temperatures it combines with sulfur vapour to

form carbon disulfide, with silicon and certain metals to form carbides, and with oxygen to form oxides, of which the most important are carbon monoxide, CO, and carbon dioxide, CO₂. Because at high temperatures carbon combines readily with oxygen that is present in compounds with metals, large quantities of coke (an inexpensive form of carbon) are used in metallurgical processes to reduce (remove oxygen from) metal oxide ores, such as those of iron and zinc.

For a detailed discussion on the organic compounds of carbon, see organic compound. Many of the industrially important carbon compounds (both organic and inorganic) are treated in separate entries.

atomic number	6
atomic weight	12.011
melting point	3,550° C (6,420° F)
boiling point	4,827° C (8,721° F)
density	
diamond	3.52 g/ml
graphite	2.25 g/ml
amorphous	1.9 g/ml
oxidation states	+2, +3, +4
electron config.	2-4 or 1s ² 2s ² 2p ²

carbon-14 dating, also called **RADIOCARBON DATING**, method of age determination that depends upon the decay to nitrogen of radiocarbon (carbon-14). Carbon-14 is continually formed in nature by the interaction of neutrons with nitrogen-14 in the Earth's atmosphere; the neutrons required for this reaction are produced by cosmic rays interacting with the atmosphere.

Radiocarbon present in molecules of atmospheric carbon dioxide enters the biological carbon cycle (*q.v.*): it is absorbed from the air by green plants and then passed on to animals through the food chain. Radiocarbon decays slowly in a living organism, and the amount lost is continually replenished as long as the organism takes in air or food. Once the organism dies, however, it ceases to absorb carbon-14, so that the amount of the radiocarbon in its tissues steadily decreases. Carbon-14 has a half-life of 5,730 ± 40 years—*i.e.*, half the amount of the radioisotope present at any given time will undergo spontaneous disintegration during the succeeding 5,730 years. Because carbon-14 decays at this constant rate, an estimate of the date at which an organism died can be made by measuring the amount of its residual radiocarbon.

The carbon-14 method was developed by the U.S. physicist Williard F. Libby about 1946. It has proven to be a versatile technique of dating fossils and archaeological specimens from 500 to 50,000 years old. The method is widely used by Pleistocene geologists, anthropologists, archaeologists, and investigators in related fields.

carbon black, any of a group of intensely black, finely divided forms of amorphous carbon, usually obtained as soot from partial combustion of hydrocarbons, used principally as reinforcing agents in automobile tires and other rubber products but also as extremely black pigments of high hiding power in printing ink, paint, and carbon paper. Carbon black is also used in protective coatings, plastics, and resistors for electronic circuits. As a reinforcing filler it greatly increases resistance to wear and abrasion. About one fourth of the weight of a standard automobile tire is carbon black. For tires on vehicles on which it is necessary to avoid building up an electrostatic charge, such as oil trucks and hospital operating carts, even more carbon black is added to make the rubber electrically conducting.

Carbon black particles are usually spherical in shape and less regularly crystalline than graphite. Carbon black changes into graphite if heated at 3,000° C (5,400° F) for a pro-

longed period. Among the most finely divided materials known, carbon blacks vary widely in particle size depending on the process by which they are made. Channel or impingement black is made by the impingement of smoky flames from tiny jets on iron channels; the deposited black is scraped off by moving the channels over stationary scrapers. Furnace blacks are made in refractory chambers by incomplete combustion of any of various types of gaseous or liquid hydrocarbons. Thermal blacks are produced in the absence of air when hydrocarbons are decomposed by contact with heated refractories. Lampblack, the oldest known black pigment, is produced by burning oil, usually coal-tar creosote, in shallow pans, in a furnace with the draft regulated to give a heavy smoke cloud. Acetylene black is produced in refractory chambers in the absence of air by the decomposition of acetylene gas preheated to 800° C (1,500° F). It is used in applications requiring high electrical conductivity, such as dry cells.

carbon cycle, in biology, circulation of carbon in various forms through nature. Carbon is a constituent of all organic compounds, many of which are essential to life on Earth. The source of the carbon found in living matter is carbon dioxide (CO₂) in the air or dissolved in water. Algae and terrestrial green plants (producers) are the chief agents of carbon dioxide fixation through the process of photosynthesis, through which carbon dioxide and water are converted into simple carbohydrates. These compounds are used by the producers to carry on metabolism, the excess being stored as fats and polysaccharides. The stored products are then eaten by consumer animals, from protozoans to man, which convert them into other forms. All animals return CO₂ directly to the atmosphere as a by-product of their respiration. The carbon present in animal wastes and in the bodies of all organisms is released as CO₂ by decay, or decomposer, organisms (chiefly bacteria and fungi) in a series of microbial transformations.

Part of the organic carbon—the remains of organisms—has accumulated in the Earth's crust as fossil fuels (*e.g.*, coal, gas, and petroleum), limestone, and coral. The carbon of fossil fuels, removed from the cycle in prehistoric time, is now being released in vast amounts as CO₂ through industrial and agricultural processes, much of it quickly passing into the oceans and there being "fixed" as carbonates. If oxygen is scarce (as in sewage, marshes, and swamps) some carbon is released as methane gas.

carbon cycle, also called **CARBON-NITROGEN CYCLE**, sequence of thermonuclear reactions that provides most of the energy radiated by the hotter stars. It is only a minor source of energy for the Sun and does not operate at all in very cool stars. Four hydrogen nuclei are in effect converted into one helium nucleus, a fraction of the mass being released as energy (according to the law of mass-energy equivalence, $E = mc^2$). The German-U.S. physicist Hans Bethe, in 1938, first described the process.

The reactions are as follows: a carbon-12 (¹²C) nucleus captures a hydrogen nucleus (¹H, a proton) to form a nucleus of nitrogen-13 (¹³N); a gamma ray (γ) is emitted in the process. The nitrogen-13 nucleus emits a positive electron (positron, e⁺) and becomes carbon-13 (¹³C). This nucleus captures another proton, becomes nitrogen-14 (¹⁴N), and emits another gamma ray. The nitrogen-14 captures a proton to form oxygen-15 (¹⁵O); the resulting nucleus ejects a positron as above and is thereby transformed to nitrogen-15 (¹⁵N). Eventually, the nitrogen-15 nucleus captures a fast-moving proton and breaks down into a carbon-12 nucleus plus a helium nucleus (alpha particle) of mass 4 (⁴He).

In symbols:

carbon dioxide (CO₂), a colourless gas having a faint, sharp odour and a sour taste; it is a minor component of the Earth's atmosphere (about 3 volumes in 10,000), formed in combustion of carbon-containing materials, in fermentation, and in respiration of animals and employed by plants in the photosynthesis of carbohydrates. The presence of the gas in the atmosphere keeps some of the radiant energy received by the Earth from being returned to space, thus producing the so-called greenhouse effect (*q.v.*). Industrially, it is recovered for numerous diverse applications from flue gases, as a by-product of the preparation of hydrogen for synthesis of ammonia, from limekilns, and from other sources.

Carbon dioxide was recognized as a gas different from others early in the 17th century by a Belgian chemist, Jan Baptist van Helmont, who observed it as a product of both fermentation and combustion. It liquefies upon compression to 75 kilograms per square centimetre (1,071 pounds per square inch) at 31° C (87.4° F) or to 16–24 kg per sq cm (230–345 lb per sq in.) at –23° to –12° C (–10° to 10° F). By the mid-20th century, most carbon dioxide was sold as the liquid. If the liquid is allowed to expand to atmospheric pressure, it cools and partially freezes to a snowlike solid called Dry Ice (*q.v.*) that sublimates (passes directly into vapour without melting) at –78.5° C (–109.3° F) at the pressure of the normal atmosphere.

At ordinary temperatures, carbon dioxide is quite unreactive; above 1,700° C (3,100° F) it partially decomposes into carbon monoxide and oxygen. Hydrogen or carbon also convert it to carbon monoxide at high temperatures. Ammonia reacts with carbon dioxide under pressure to form ammonium carbamate, then urea, an important component of fertilizers and plastics. Carbon dioxide is slightly soluble in water (1.79 volumes per volume at 0° C and atmospheric pressure, larger amounts at higher pressures), forming a weakly acidic solution. This solution contains the dibasic acid called carbonic acid (H₂CO₃).

Carbon dioxide is used as a refrigerant, in fire extinguishers, for inflating life rafts and life jackets, blasting coal, foaming rubber and plastics, promoting the growth of plants in greenhouses, immobilizing animals before slaughter, and in carbonated beverages.

Ignited magnesium continues to burn in carbon dioxide, but the gas does not support the combustion of most materials. Prolonged exposure of humans to concentrations of 5 percent carbon dioxide may cause unconsciousness and death.

carbon disulfide (CS₂), also called **CARBON BISULFIDE**, a colourless, toxic, highly volatile and flammable liquid chemical compound, large amounts of which are used in the manufacture of viscose rayon, cellophane, and carbon tetrachloride; smaller quantities are employed in solvent extraction processes or converted into other chemical products, particularly accelerators of the vulcanization of rubber or agents used in flotation processes for concentrating ores.

For many years carbon disulfide was manufactured by the reaction of charcoal with sulfur vapour at temperatures of 750°–1,000° C (1,400°–1,800° F), but, by the mid-20th century, that process had been superseded, especially in the United States, by one based on the reaction of natural gas (principally methane) with sulfur.

The use of carbon disulfide for extraction of

fats, oils, and waxes has been largely discontinued in favour of other solvents that are less toxic and flammable. The use of carbon disulfide in making rayon and cellophane depends upon its reaction with cellulose and caustic soda to form colloidal solutions of cellulose xanthate, which can be extruded into a dilute solution of sulfuric acid, which coagulates the cellulose films or fibres and sets free the carbon disulfide.

Carbon disulfide is denser than water and only slightly soluble in it. Its boiling point is 46.3°C (115.3°F) and its freezing point -110.8°C (-169.2°F); its vapour, which is heavier than air, is ignited with extraordinary ease.

Consult the INDEX first

carbon group element, any of the five chemical elements that make up Group IVa of the periodic table—namely, carbon (C), silicon (Si), germanium (Ge), tin (Sn), and lead (Pb). A brief treatment of the carbon group elements follows. For full treatment, see *MACROPAEDIA: Chemical Elements*. See also *MICROPAEDIA* for entries on each member of the family.

Elemental carbon is a minor component in the crust of the Earth, but it is among the more plentiful elements in the universe. Only hydrogen, helium, oxygen, neon, and nitrogen are more abundant. Silicon is a basic constituent of the Earth's crust, exceeded only by oxygen in abundance; it is the seventh most plentiful element in the universe. Germanium, tin, and lead, on the other hand, are relatively scarce both in the upper terrestrial layer and in the cosmos.

The properties of the carbon group elements are intermediate between those associated with the elements of the adjacent boron and nitrogen groups of the periodic table. In all these groups the metallic properties, which result from the tendency to hold valence (outermost) electrons more loosely, increase with atomic number. This characteristic is most apparent in the case of the carbon group elements. Carbon is a nonmetal and silicon nearly so. Germanium resembles a metal in appearance and in certain other properties. Tin is almost completely metallic, whereas lead is a true metal in every respect.

The atoms of the carbon group elements have a similar electronic structure. They all have four electrons in their outermost shells. Every element of the group forms covalent bonds with nonmetallic atoms. Carbon and silicon cannot lose or gain electrons to form free ions, while germanium, tin, and lead do form metallic ions but only with two positive charges.

In the solid state, elemental carbon, silicon, germanium, and gray tin (alpha tin) occur as cubic crystals based on a three-dimensional arrangement of bonds. Each atom is covalently bonded to four neighbouring atoms, forming the corners of a tetrahedron. Decreasing melting points, boiling points, and heat energies associated with fusion, sublimation, and vaporization among these four elements with increasing atomic number and atomic size indicate a parallel weakening of the covalent bonds in this kind of structure.

carbon monoxide (CO), a highly toxic, colourless, odourless, flammable gas produced industrially for use in the manufacture of numerous organic and inorganic chemical products; it is also present in the exhaust gases of internal-combustion engines and furnaces as a result of incomplete conversion of carbon or carbon-containing fuels to carbon dioxide.

Carbon monoxide's toxicity is a consequence of its absorption by red blood cells in preference to oxygen, thus interfering with the transport of oxygen from the lungs to the tissues,

in which it is required. Indication of carbon monoxide poisoning include headache, weakness, dizziness, nausea, fainting, and, in severe cases, coma, weak pulse, and respiratory failure. Treatment must be prompt and includes respiratory assistance and the administration of oxygen, often with 5 percent carbon dioxide and sometimes under high pressure.

For use in manufacturing processes, carbon monoxide is made by passing air through a bed of incandescent coke or coal, or by the reaction of natural gas with oxygen at high temperatures in the presence of a catalyst. The carbon monoxide resulting from these processes generally is contaminated with other substances, such as nitrogen or carbon dioxide, which may be removed if they are undesirable in the intended application.

Carbon monoxide condenses to the liquid at -192°C (-314°F) and it freezes at -199°C (-326°F). It is only slightly soluble in water, and its physical properties closely resemble those of nitrogen.

Carbon monoxide reacts with water vapour at high temperatures, forming carbon dioxide and hydrogen; this process has been used as a source of hydrogen for combination with nitrogen in the synthesis of ammonia. With caustic alkalis, carbon monoxide forms alkali formates, which can be converted into either formic acid or alkali oxalates for the production of oxalic acid. With certain metals, carbon monoxide forms compounds called carbonyls, many of which are volatile; this reaction has been used in the purification of nickel. Carbon monoxide and hydrogen are the starting materials in the manufacture of methanol and also are used in the preparation of aldehydes and alcohols from olefins and in making mixtures of liquid hydrocarbons suitable for use as fuels.

carbon-nitrogen cycle (astrophysics): see carbon cycle.

carbon steel, metal manufactured from the elements iron and carbon, with the carbon imparting hardness and strength and determining the degree to which such physical properties exist. See steel.

carbon tetrachloride, also called **TETRACHLOROMETHANE**, a colourless, dense, highly toxic, volatile, nonflammable liquid possessing a characteristic odour and belonging to the family of organic halogen compounds, used principally in the manufacture of dichlorodifluoromethane (a refrigerant and propellant).

First prepared in 1839 by the reaction of chloroform with chlorine, carbon tetrachloride is manufactured by the reaction of chlorine with carbon disulfide or with methane. The process with methane became dominant in the United States in the 1950s, but the process with carbon disulfide remains important in countries where natural gas (the principal source of methane) is not plentiful. Carbon tetrachloride boils at 77°C (171°F) and freezes at -23°C (-9°F); it is much denser than water, in which it is practically insoluble.

Formerly used as a dry-cleaning solvent, carbon tetrachloride has been almost entirely displaced from this application by tetrachloroethylene, which is much more stable and less toxic.

carbonaceous chondrite, any stony meteorite containing material associated with life (e.g., hydrocarbons, amino acids, and forms resembling microscopic fossils) and for which some researchers have postulated an extraterrestrial biological origin. Instead of containing the anhydrous silicates found in most chondrites, the carbonaceous types have claylike hydrous silicate minerals. They also contain carbonate and sulfate minerals, iron oxides, and sulfur. Magnesium sulfate is found in narrow veins; and since it is water soluble, carbonaceous chondrites disintegrate rapidly because of weathering.

They comprise about 3 percent of all the meteorites collected after being seen in flight. Their texture, similar to that of the terrestrial rocks called volcanic tuffs, indicates that they have been repeatedly fragmented and cemented. See also chondrite.

carbonado, one of the varieties of industrial diamond (*q.v.*).

Carbonaro, plural **CARBONARI** (Italian dialect: Charcoal Burner), in early 19th-century Italy, member of a secret society (the Carbonaria) advocating liberal and patriotic ideas. The group provided the main source of opposition to the conservative regimes imposed on Italy by the victorious allies after the defeat of Napoleon in 1815. Their influence prepared the way for the Risorgimento movement, which resulted in Italian unification (1861).

The origins and even the political program of the Carbonari are matters of conjecture. The group may have begun as a mutual aid society in France and spread to Italy with the Napoleonic army, or it may have been an offshoot of the Freemasons, an anticlerical, philanthropic secret society widespread in the 18th century. The first lodges of the Carbonari were formed in southern Italy in the early 1800s. They acquired a republican and patriotic character, opposing Joachim Murat, the Napoleonic ruler of Naples. The movement spread northward into the Marches and the Romagna by 1814. In general, the Carbonari favoured constitutional and representative government and wished to protect Italian interests against foreigners. But they never had a single program: some wanted a republic, others a limited monarchy; some favoured a federation, others a unitary Italian state.

Like other secret societies of the age, the Carbonari had an initiation ceremony, complex symbols, and a hierarchical organization. Their members were recruited mainly from the nobility, officeholders, and small landowners. After 1815 the lodges spread rapidly among those dissatisfied with the post-Napoleonic settlement, especially among the middle classes, which had been favoured under French rule. Although the Carbonari had lodges throughout Italy, their main centres were in central Italy (the Papal States) and in the South (Naples), where the Bourbon Kingdom of the Two Sicilies was restored in 1815 and where they took up a decisively anti-Bourbon attitude. With the help of the army they led the successful Neapolitan revolution of 1820, which forced King Ferdinand I to promise a constitution. This was their most spectacular achievement, but Austrian intervention soon nullified it. Revolts in Bologna, Parma, and Modena in 1831 met with little success. In the same year, Giuseppe Mazzini founded a new movement, Young Italy, with an avowedly national and republican program, and the importance of the Carbonari began to wane.

Outside Italy a similar movement called the Charbonnerie had taken root in France. It participated in outbreaks in 1821, and Lafayette himself condended to be its head. An international organization called the Charbonnerie Démocratique Universelle continued to operate for a few years after 1830 under the leadership of Filippo Buonarroti (1761-1837), but it achieved little.

carbonate, any member of two classes of chemical compounds derived from carbonic acid or carbon dioxide (*q.v.*). The inorganic carbonates are salts of carbonic acid (H_2CO_3), containing the carbonate ion, CO_3^{2-} , and ions of metals such as sodium or calcium. Inorganic carbonates comprise many minerals (see carbonate mineral) and are the principal constituents of limestones and dolomites; they also comprise the hard parts of many marine

invertebrates. Organic carbonates are esters; that is, compounds in which the hydrogen atoms of carbonic acid have been replaced by carbon-containing combining groups such as ethyl, C_2H_5 .

carbonate-apatite, rare phosphate mineral belonging to the apatite series. *See* apatite.

carbonate mineral, any member of a family of minerals that contain the carbonate ion, CO_3^{2-} , as the basic structural and compositional unit. The carbonates are among the most widely distributed minerals in the Earth's crust.

A brief treatment of carbonate minerals fol-

lows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

The crystal structure of many carbonate minerals reflects the trigonal symmetry of the carbonate ion, which is comprised of a carbon atom centrally located in an equilateral triangle of oxygen atoms. This anion group usually occurs in combination with calcium, sodium, uranium, iron, aluminum, manganese, barium, zinc, copper, lead, or the rare-earth elements. The carbonates tend to be soft, soluble in hydrochloric acid, and have a marked anisotropy in many physical properties (*e.g.*, high birefringence) as a result of the planar structure of the carbonate ion.

There are approximately 80 known carbonate minerals, but most of them are rare. The commonest varieties, calcite, dolomite, and

aragonite, are prominent constituents of certain rocks: calcite is the principal mineral of limestones and marbles; dolomite occurs as a replacement for calcite in limestones, and when this is extensive the rock is termed dolomite; and aragonite occurs in some recent sediments and in the shells of organisms that have calcareous skeletons. Other relatively common carbonate minerals serve as metal ores: siderite, for iron; rhodochrosite, for manganese; strontianite, for strontium; smithsonite, for zinc; witherite, for barium; and cerussite, for lead.

Most such rock-forming carbonates belong to one of two structure groups—either calcite or aragonite. The calcite structure is usually described with reference to the sodium chloride structure in which the sodium and chlo-

Carbonate minerals

name formula	colour	lustre	Mohs hardness	specific gravity	habit	fracture or cleavage	refractive indices	crystal system, space group	remarks
alstonite $CaBa(CO_3)_2$	colourless to snow-white; grayish, creamy, pink	vitreous	4-4½	3.7	pseudo-hexagonal dipyramids	uneven fracture	$\alpha = 1.526$ $\beta = 1.671$ $\gamma = 1.672$	orthorhombic	weakly fluorescent in long-wave ultraviolet light
aragonite $CaCO_3$	colourless to white, variable	vitreous	3½-4	2.9-3	twinned prismatic crystals; columnar aggregates; crusts	one distinct cleavage	$\alpha = 1.527-1.535$ $\beta = 1.676-1.690$ $\gamma = 1.680-1.695$	orthorhombic Pmcn	polymorphous with calcite and vaterite; fluorescent under electron beams, X-rays, and ultraviolet light; thermoluminescent
aurichalcite $(Zn, Cu)_5(OH)_6(CO_3)_2$	pale green to green-blue or sky blue	silky to pearly	1-2	3.6	feathery incrustations	one perfect cleavage	$\alpha = 1.654-1.661$ $\beta = 1.740-1.749$ $\gamma = 1.743-1.756$	orthorhombic	
azurite $Cu_3(OH)_2(CO_3)_2$	azure blue; various shades of blue	vitreous	3½-4	3.8	tabular or prismatic crystals; also massive	one perfect, but interrupted cleavage	$\alpha = 1.730$ $\beta = 1.755$ $\gamma = 1.836$	monoclinic $\frac{2}{a}$	
bastnaesite $CeCO_3(OH, F)$	yellow to reddish brown	vitreous to greasy	4-4½	4.9-5.2	tabular crystals; massive	uneven fracture	$\omega = 1.717-1.722$ $\epsilon = 1.818-1.823$	hexagonal C6c2	
bismutite $(BiO)_2CO_3$	straw yellow to brownish yellow; variable	vitreous	2½-3½	6.7-7.4	earthy masses; crusts			tetragonal	
calcite $CaCO_3$	colourless when pure; variable	vitreous	3 (a hardness standard)	2.7 (pure $CaCO_3$)	widely varied crystal habit; massive; parallel growths; crystal aggregates	one perfect cleavage	$\omega = 1.658$ $\epsilon = 1.486$ (pure $CaCO_3$)	hexagonal R3c	polymorphous with aragonite and vaterite; hydrates occur in nature (<i>e.g.</i> , ikaite, $CaCO_3 \cdot 6H_2O$); forms solid solution series with rhodochrosite, in which Mn replaces Ca, and toward siderite, in which Fe partially replaces Ca
cerussite $PbCO_3$	colourless to white	adamantine	3-3½	6.5-6.6	extremely varied; crystal clusters; massive	two distinct cleavages	$\alpha = 1.793-1.814$ $\beta = 2.060-2.092$ $\gamma = 2.061-2.093$	orthorhombic Pmcn	fluorescent in X-rays and long-wave ultraviolet light
cobaltocalcite $CoCO_3$	rose red, altering to gray, brown, black	vitreous	4	4.1	concentric spherical masses; crusts		$\omega = 1.85-1.86$ $\epsilon = 1.59-1.61$	hexagonal R3c	
dawsonite $NaAlCO_3(OH)_2$	colourless to white	vitreous	3	2.4	incrustations; rosettes; tufts	one perfect cleavage	$\alpha = 1.462-1.466$ $\beta = 1.537-1.542$ $\gamma = 1.589-1.596$	orthorhombic Imam	
dolomite $CaMg(CO_3)_2$	colourless to white; gray, greenish, pink, brown	vitreous to pearly	3½-4	2.8-3	compact or granular massive; rhombohedral crystals	one perfect cleavage	dolo anker $\omega = 1.679-1.750$ $\epsilon = 1.500-1.548$	hexagonal R3	forms solid solution series with ankerite in which Fe replaces Mg; triboluminescent; fluorescent in ultraviolet light
gaylussite $Na_2Ca(CO_3)_2 \cdot 5H_2O$	colourless to white, yellowish, or grayish	vitreous	2½-3	2	elongated or wedgelike crystals	one perfect cleavage	$\alpha = 1.4435$ $\beta = 1.516$ $\gamma = 1.523$	monoclinic	
kutnohorite $KaMn(CO_3)_2$	white to pale rose	vitreous	4	3	granular to coarse masses	one perfect cleavage	$\omega = 1.727$ $\epsilon = 1.535$	hexagonal R3c	triboluminescent; sometimes fluorescent in ultraviolet light; forms solid solution series with siderite in which Fe replaces Mg, and toward calcite and rhodochrosite in which Ca and Mn, respectively, partially replace Mg
magnesite $MgCO_3$	colourless; white, grayish; yellowish to brown	vitreous	4	3	granular or compact massive; earthy; fibrous	one perfect cleavage	$\omega = 1.700$ $\epsilon = 1.509$ (pure $MgCO_3$)	hexagonal R3c	

ride of halite are replaced by calcium atoms and CO_3 groups, respectively. The unit cell of halite is distorted by compression along a three-fold axis, resulting in a rhombohedral cell. In calcite all CO_3 groups are parallel and lie in horizontal layers; CO_3 groups in adjacent layers, however, point in opposite directions. The calcium atoms are bonded to six oxygen atoms, one each from three CO_3 groups in a layer above and three from CO_3 groups in a layer below. The structure of dolomite, $\text{CaMg}(\text{CO}_3)_2$, is similar to that of calcite, CaCO_3 , except that there is regular alternation of calcium and magnesium, and a lower symmetry, though still rhombohedral, results. The second structure group, that of aragonite, is orthorhombic. Like the calcite structure, the cation in the aragonite structure is surrounded

by G carbonate groups; the CO_3 groups, however, are rotated about an axis perpendicular to their plane and the cation is coordinated to nine oxygen atoms instead of six.

Carbonate minerals other than simple carbonates include hydrated carbonates, bicarbonates, and compound carbonates containing other anions in addition to carbonate. The first two groups include nahcolite, trona, natron, and shortite; they typically occur in sedimentary evaporite deposits and as low-temperature hydrothermal alteration products. The members of the third group generally contain rare-earth elements and almost always result from hydrothermal alteration at low temperatures. Examples of these carbonate minerals are bastnäsite, doverite, malachite, and azurite.

carbonate rock, any rock composed mainly of carbonate minerals. The principal members of the group are the sedimentary rocks dolomite and limestone (*qq.v.*).

Carbondale, city, Jackson County, southern Illinois, U.S., at the northern edge of the Illinois Ozarks. Founded in 1852 after the arrival of the Illinois Central Railroad, and named for the local coalfields, it developed as a mining and agricultural centre. Its growth was boosted by the opening in 1874 of a normal school (since 1947, Southern Illinois University). Gen. John A. Logan, commander in chief of the Grand Army of the Republic, issued

Carbonate minerals (continued)

name formula	colour	lustre	Mohs hardness	specific gravity	habit	fracture or cleavage	refractive indices	crystal system space group	remarks
malachite $\text{Cu}_2\text{CO}_3(\text{OH})_2$	bright green to dark or blackish green	adamantine; silky, dull or earthy	3½-4	4-4.1	tufts and rosettes of needlelike crystals; botryoidal massive; fibrous aggregates	one perfect, one fair cleavage	$a = 1.652-1.658$ $\beta = 1.872-1.878$ $\gamma = 1.906-1.912$	monoclinic $P2_1/a$	
nahcolite NaHCO_3	colourless to white	vitreous	2½	2.2	prismatic crystals and friable crystal aggregates; porous masses	one perfect, one good cleavage	$a = 1.377-1.378$ $\beta = 1.500-1.503$ $\gamma = 1.583-1.584$	monoclinic $P2_1/n$	easily soluble in water; water solution gives off CO_2 on heating
pirssonite $\text{Na}_2\text{Ca}(\text{CO}_3)_2 \cdot 2\text{H}_2\text{O}$	colourless to white; grayish	vitreous	3-3½	2.4	prismatic or tabular crystals	conchoidal fracture	$a = 1.504$ $\beta = 1.510$ $\gamma = 1.575$	orthorhombic Fdd2	pyroelectric
rhodochrosite MnCO_3	various shades of pink; rose to rose-red	vitreous	3½-4	3.7	granular to compact massive; columnar massive; incrustations	one perfect cleavage	$\omega = 1.816$ $\epsilon = 1.597$ (pure MnCO_3)	hexagonal R3c	forms solid solution series with siderite and calcite in which Fe and Ca respectively replace Mn and toward magnesite in which Mg partially replaces Mn
schroëckerite $\text{NaCa}_3\text{UO}_2(\text{CO}_3)_3 \cdot \text{SO}_4 \cdot 10\text{H}_2\text{O}$	greenish yellow	weakly vitreous	2½	2.5	aggregates of flattened scales	one perfect cleavage	$\omega = 1.539-1.545$ $\epsilon = 1.489-1.496$	hexagonal (?)	fluorescent in ultraviolet light
siderite FeCO_3	yellowish brown and grayish brown to brown	vitreous	4	4 (pure FeCO_3)	granular massive; rhombohedral crystals; botryoidal	one perfect cleavage	$\omega = 1.875$ $\epsilon = 1.633$ (pure FeCO_3)	hexagonal R3c	forms solid solution series with rhodochrosite and magnesite in which Mn and Mg respectively replace Fe and toward calcite in which Ca partially replaces Fe
smithsonite ZnCO_3	grayish white to dark gray, greenish, brownish white; variable	vitreous	4-4½	4.4 (pure ZnCO_3)	botryoidal, reniform or stalagmitic masses; crusts; granular to compact massive	one nearly perfect cleavage	$\omega = 1.842-1.874$ $\epsilon = 1.619-1.633$	hexagonal R3c	
strontianite SrCO_3	colourless to gray; yellowish, greenish	vitreous	3½	3.7-3.8	prismatic crystals; columnar to fibrous massive; granular massive	one nearly perfect cleavage	$a = 1.518-1.522$ $\beta = 1.662-1.670$ $\gamma = 1.664-1.673$	orthorhombic Pmcn	fluorescent and phosphorescent in electron beams, X-rays, and ultraviolet light; sometimes thermoluminescent
thermonatrite $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$	colourless to white; grayish yellowish	vitreous	1-1½	2.3	crusts; efflorescences		$a = 1.420$ $\beta = 1.506$ $\gamma = 1.524$	orthorhombic Pmmm	alkaline taste
trona $\text{Na}_3\text{H}(\text{CO}_3)_2 \cdot 2\text{H}_2\text{O}$	gray or yellowish white; colourless	glistening vitreous	2½-3	2.1	fibrous or columnar massive	one perfect cleavage	$a = 1.412$ $\beta = 1.492$ $\gamma = 1.540$	monoclinic	alkaline taste; not dehydrated by dry air
vaterite CaCO_3				2.6	hexagonal platelets; spherulitic		$\omega = 1.550$ $\epsilon = 1.640-1.650$	hexagonal	polymorphous with calcite and aragonite
witherite BaCO_3	colourless to milky, white, or grayish	vitreous	3-3½	4.3	pseudohexagonal twinned crystals; massive	one distinct cleavage	$a = 1.529$ $\beta = 1.676$ $\gamma = 1.677$	orthorhombic Pmcn	fluorescent and phosphorescent in electron beams, X-rays, and ultraviolet light; thermoluminescent
zaraitite $\text{Ni}_3\text{CO}_3(\text{OH})_4 \cdot 4\text{H}_2\text{O}$	emerald green	vitreous to greasy	3½	2.6-2.7	incrustations; compact massive	conchoidal fracture	$n = 1.56-1.61$	isometric	

the order in Carbondale (1868) designating May 30 as Memorial (Decoration) Day. Crab Orchard National Wildlife Refuge, Shawnee National Forest, and Giant City State Park are nearby. Inc. 1856. Pop. (1990) 27,033.

Carbondale, city, Lackawanna county, north-eastern Pennsylvania, U.S., on the Lackawanna River. Located in a coal-mining and mountain resort region, it is 16 miles (26 km) northeast of the city of Scranton. Founded in 1822 by William and Maurice Wurts, coal prospectors, the site had been previously known as Ragged Island and Barrendale and was obviously renamed for the successful open-pit coal-mining operations there. The need for coal transport spurred the development of the Delaware and Hudson Canal (1825) and a gravity railroad, from Carbondale to Honesdale. The locomotive *Stourbridge Lion* (now in the Smithsonian Institution, Washington, D.C.) made its initial run on that line Aug. 9, 1829, but proved impractical. Hauling via horses and mules was resumed. In June 1831 the world's first underground anthracite mine was opened at Carbondale. With the decline of the coalfields, economic emphasis was switched to light industry. The Elk Mountain Ski Center is 12 miles (19 km) north. Inc. 1831. Pop. (1990) 10,664.

carbonic anhydrase, enzyme found in red blood cells, gastric mucosa, pancreatic cells, and renal tubules that catalyzes the interconversion of carbon dioxide (CO_2) and carbonic acid (H_2CO_3). Carbonic anhydrase plays an important role in respiration by influencing CO_2 transport in the blood. The enzyme also functions in the formation of hydrochloric acid by the stomach.

Carboniferous Period, interval of geologic time from 360 to 286 million years ago. It is often divided into the Early Carboniferous Epoch (360 to 320 million years ago) and the Late Carboniferous Epoch (320 to 286 million years ago). The fifth period of the Paleozoic Era, the Carboniferous Period follows the Devonian and precedes the Permian Period. The rocks that originated during Carboniferous time make up the Carboniferous System.

A brief treatment of the Carboniferous Period follows. For full treatment, see *MACROPAEDIA: Geochronology*.

The Carboniferous System was identified by William Daniel Conybeare and John Phillips in Great Britain in 1822. Its name refers to the presence of coals in many parts of the succession of strata between the Old Red Sandstone (Devonian) and the New Red Sandstone (Permian) formations in Britain. In North America the Carboniferous is often represented by the Mississippian and Pennsylvanian periods, which are named after the states in which the strata are widely developed and which correspond to the Early Carboniferous and Late Carboniferous time periods. In Europe the Carboniferous System is often subdivided into the Lower Carboniferous and Upper Carboniferous, which correspond to the time units Early and Late. The classification of the Carboniferous rock units and their corresponding time units had become so complex by the end of the first quarter of the 20th century that the International Geological Congress and later the Carboniferous Subcommittee of the International Union of Geological Sciences set out to establish criteria by which to define an international time scale for the period. The boundaries of the system and their time equivalents have been generally agreed on, but minor subdivisions are still subject to debate.

The distribution of the continental landmasses continued to change during the Carboniferous Period. All the landmasses drew closer together as tectonic plate movements

gathered them toward the equatorial regions and the southern half of the globe. The enormous continent of Gondwana, made up of what is now Africa, South America, India, the Middle East, Australia, and Antarctica, occupied much of the Southern Hemisphere. Early in the period, Laurussia, consisting principally of present-day North America, Greenland, and northern Europe, advanced toward Gondwana's northern margin. By the end of the Carboniferous Period, most of Laurussia had collided with Gondwana, closing the Tethys seaway between them. The ensuing Appalachian-Hercynian orogeny fused the two continents together. Siberia and China (including Southeast Asia), which were individual continents at this time, remained at high latitudes in the Northern Hemisphere.

In Gondwana a heavy and prolonged continental glaciation occurred at a south polar centre situated in the vicinity of southern Africa. Later, as the ice diminished, the sea level was restored and the climate ameliorated. Swamps became widespread in both northern and southern continental areas and forest vegetation thrived. The coal deposits of the later Carboniferous times were formed from the debris of these forests, and the widespread and repeated growth of the coal swamp forests was a most characteristic feature of the Carboniferous Period. This episode of coal formation was terminated by a rise in the landmasses and an increasingly arid climate. The end of these environments presaged the great crisis that was to affect much of the living world in the following Permian Period.

The immense volume of carbon incorporated in plant debris during Carboniferous times came from the atmosphere. Some scientists have maintained that the removal of so much carbon dioxide from the atmosphere affected the climate, but this is disputed and not believed to have been a significant factor in the period. Coal, formed during the Carboniferous Period, is found in many areas of the world, including eastern North America, Europe, North Africa, and northern China and Korea. The process of coal formation lasted about 40 million years, and no other period was to see the transformation of so much plant material into coal.

In addition to the great advances made by plants with their complex forest assemblages, the vertebrates were undergoing an evolutionary radiation. Amphibians became widespread and diverse, with some as large as 2 m (6 feet). Reptiles appeared for the first time and rapidly adapted to many habitats.

The Carboniferous Period thus was marked by great changes to world geography. Life-forms made significant advances and adapted to a range of climates that included the periglacial, the equatorial rainy, and the hot arid. Continental climates characterized by seasonal extremes were probably as widespread as at any time in the history of the Earth.

carboniferous shale: see black shale.

carbonium ion, any member of a class of organic molecules with positive charges localized at a carbon atom. Certain carbonium ions can be prepared in such a way that they are stable enough for study; more frequently they are only short-lived forms (intermediates) occurring during chemical reactions.

Carbonium ions are, in fact, one of the most common classes of intermediates in organic reactions, and knowledge of the structures and properties of these substances is fundamental to understanding reactions in which they occur. Many of these reactions are of synthetic, biochemical, or industrial importance.

The first carbonium ions were observed in 1901; it was not until 21 years later, however, that German chemist Hans Meerwein concluded that a neutral product (isobornyl chloride) was formed from a neutral reactant (camphene hydrochloride) by rearrangement

involving a carbonium ion intermediate. This was the first conceptualization of a carbonium ion as an intermediate in an organic rearrangement reaction. The idea was generalized by the American chemist Frank Clifford Whitmore from 1932 onward and placed on a firm experimental basis by the English chemists Sir Christopher Ingold and E.D. Hughes, beginning in the late 1920s. Although a great deal had been surmised about carbonium ions by indirect methods, it was only after 1960 that general methods for the formation of stable, long-lived carbonium ions became available.

Classification. Two distinct classes of carbonium ions have come to be recognized. The first are the "classical" carbonium ions, which contain a trivalent carbon atom centre. The carbon atom is in an sp^2 state of hybridization—that is, three electrons of the carbon atom occupy orbitals formed by the combination (hybridization) of three ordinary orbitals, one denoted s and two, p . All three orbitals lie in one plane; thus, the cationic centre of the molecule formed by bonding the carbon atom with three other atoms or groups tends to be planar. The parent for these ions is the methyl cation, with the formula CH_3^+ . Schematically, the structure is as shown below (the solid lines representing bonds between atoms):

The second class of carbonium ions includes the pentacoordinated, or "nonclassical," carbonium ions, which have three single bonds, each joining the carbon atom to one other atom, and a two-electron bond that connects three atoms, rather than the usual two, with a single electron pair. The parent structure for these ions is that of the methonium ion, CH_3^+ , in which the dotted lines represent a three-centre bond:

It is frequently possible to distinguish between these two types of carbonium ions experimentally, as, for example, by the use of certain instrumental methods. These methods include nuclear magnetic-resonance spectroscopy, which gives information about atomic nuclei; infrared and Raman spectroscopy, which are based on light absorption; and, more recently, X-ray-induced electron-emission spectroscopy, which gives information about bond energies.

Preparation and stability. Several methods are known for the generation of carbonium ions. They may all, however, be classified in one of the following categories: (1) heterolytic (unsymmetrical) cleavage of the two-electron bond between a carbon atom and an attached group; (2) electron removal from a neutral organic compound; (3) addition of a proton, or other cation, to an unsaturated system; and (4) protonation, or alkylation (addition of an alkyl, or hydrocarbon, group), of a carbon-carbon or carbon-hydrogen single bond. Since carbonium ions are positively charged species, they are most readily formed in relatively polar solvents (solvents consisting of molecules with unsymmetrical distribution of electrons), which help disperse their charges or the charges on the accompanying negative ions throughout the medium. Commonly used solvents include methanol, aqueous acetone, acetic acid, and trifluoroacetic acid.

The fate of a carbonium ion produced by

one of these methods is determined essentially by two factors: (1) the nature of the medium in which the ion is generated and (2) the inherent stability of the ion itself. Carbonium ions react rapidly with the solvent or with any available substance attracted to positively charged entities. Therefore carbonium ions have only a fleeting existence, and indirect methods must be used for their study. The common methods are kinetics (measurements of rates of reaction), chemical analysis of the product formed by reaction of the carbonium ion (particularly, determination of spatial arrangements of atoms in a molecule), and isotopic labelling (that is, the use of radioactive isotopes to identify particular atoms).

Solvents have been found that do not react with many carbocations. These solvents are hydrogen fluoride-antimony pentafluoride and fluorosulfuric acid-antimony pentafluoride with sulfur dioxide or sulfuryl chloride fluoride also present. In these solvents, the lifetime of many carbonium ions is sufficient to allow direct observation.

Tertiary carbonium ions are generally more stable than secondary carbonium ions, which, in turn, are more stable than primary ones. In tertiary carbonium ions, the sp^2 carbon is bonded to three alkyl groups; in secondary carbonium ions, the sp^2 carbon atom is bonded to two alkyl groups and one hydrogen atom; in primary carbonium ions, the sp^2 carbon is bonded to either one alkyl group and two hydrogen atoms or, in the case of the methyl cation, three hydrogen atoms. Examples of each are shown below.

This order of relative stability is explained on the basis of the ability of an alkyl group to disperse the charge on the sp^2 carbon atom.

Benzyl cations are more stable than most primary cations because in the benzyl ions the positive charge can become distributed among the carbon atoms of the aromatic ring so the cation can exist in many forms, all of which contribute to the overall structure. Such forms of the benzyl cation are shown below:

In these structures the benzene ring is indicated by a hexagon, each corner of which is considered to be a carbon atom (the attached hydrogens not being shown). The form with a circle in the hexagon represents structures with alternating single and double bonds in the ring; the other forms are those in which charges appear at various locations in the ring.

Reactions. Since carbonium ions are electron-deficient entities, they react with any electron-donor molecules, which are also referred to as nucleophiles. There are three types of nucleophiles: *n*-bases, pi bases, and sigma bases, in which *n*, pi, and sigma refer to the bonding state of the donor-electron pair in the nucleophile—that is, nonbonded, pi-bonded, and sigma-bonded, respectively. (Sigma bonds are ordinary covalent bonds between atoms, and pi bonds are the special bonds that occur in unsaturated and aromatic systems.) The nucleophile may be either external or internal (that is, constituting a portion of the cation itself). In the latter case, rearrangement may occur. Examples of the various possible reaction types are shown below:

1. Reaction with external *n*-base: acid-catalyzed hydration (addition of water) of isobutylene. In this reaction, there is an unshared (nonbonded) electron pair on the oxygen atom of the water molecule:

2. Reaction with external base: alkylation of benzene using isopropyl chloride (Friedel-Crafts reaction). Benzene acts as the donor molecule, with the donated electrons coming from the pi-bonded system of the benzene ring:

In the above equation, the partial circle with the plus charge in the hexagon stands for those forms of the cation in which the positive charge is distributed around the ring (as in the benzyl cation, pictured above).

3. Reaction with external sigma base: hydride transfer reaction in which the donor electron pair comes from the carbon-hydrogen sigma bond in isobutane:

4. Reaction with internal *n*-base: cyclization reaction, with nonbonded electron pair on an oxygen atom serving as donor:

5. Reaction with internal pi base: acid-catalyzed cyclization to form β -ionone, with the donor electrons coming from the pi electrons of the unsaturated system:

6. Reaction with internal sigma base: acid-catalyzed rearrangement of neopentyl alcohol, the electron pair coming from an internal carbon-carbon sigma bond:

Each of these reaction types is widely employed in synthetic organic reactions, and the many acid-catalyzed hydrocarbon transformation reactions are fundamental in petroleum chemistry and in vital bio-organic processes. An important process in the manufacture of high-octane gasoline, for example, consists of the acid-catalyzed isomerization of straight-chain hydrocarbons to branched-chain hydrocarbons. One example of the significance of carbonium ions in bio-organic processes may be found in the biological synthesis of the important material cholesterol from a precursor, squalene, by way of another compound, lanosterol. In this transformation, acid-catalyzed rearrangements—reaction type 6, described earlier—occur repeatedly.

(G.A.O./P.R.Cd./Ed.)

BIBLIOGRAPHY. D. Bethell and V. Gold, *Carbonium Ions* (1967), is an excellent introduction and has an extensive bibliography. G.A. Olah and P.V.R. Schleyer (eds.), *Carbonium Ions*, 4 vol. (1968), is a review of particular aspects of carbonium-ion chemistry, with individual chapters written by active researchers in the field.

carbonyl, metal: see metal carbonyl.

carbonyl chloride: see phosgene.

carbonyl group, in organic chemistry, a divalent chemical unit consisting of a carbon (C) and an oxygen (O) atom connected by a double bond. The group is a constituent of carboxylic acids, esters, anhydrides, acyl halides, amides, and quinones, and it is the characteristic functional group (reactive group) of aldehydes and ketones. Carboxylic acids (and their derivatives), aldehydes, ketones, and quinones are also known collectively as carbonyl compounds.

Because of a difference in the electron affinities of the carbon and oxygen atoms, the electron pairs that constitute the double bond are held closer to the oxygen atom than to the carbon atom; the electron-rich oxygen atom acquires a negative charge and the electron-deficient carbon atom a positive charge. Thus, molecules containing the carbonyl group are polar. Compounds containing a carbonyl group have higher melting and boiling points than hydrocarbons containing the same number of carbon atoms and are more soluble in polar solvents such as water. The carbonyl group can enter into a variety of chemical reactions; nucleophilic reagents (electron-rich reagents) are attracted to the carbon atom, whereas electrophilic reagents (electron-seeking reagents) are attracted to the oxygen atom.

Aldehydes and ketones contain carbonyl groups attached to alkyl or aryl groups and a hydrogen atom or both. These groups have little effect on the electron distribution in the carbonyl group; thus, the properties of aldehydes and ketones are determined by the behaviour of the carbonyl group. In carboxylic acids and their derivatives, the carbonyl group is attached to one of the halogen atoms or to groups containing atoms such as oxygen, nitrogen, or sulfur. These atoms do affect the carbonyl group, forming a new functional group with distinctive properties.

carborane, any member of a class of organometallic compounds having the general formula $C_2B_nH_{n+2}$, in which C, B, and H represent, respectively, carbon, boron, and hydrogen atoms and n an integer; carboranes with n ranging from 3 to 10 have been characterized. The carboranes have polyhedral molecular structures based on networks of boron and carbon atoms, the carbon atoms occupying adjacent positions. They are generally prepared by reaction of acetylene or acetylene derivatives with boron hydrides.

The best-studied carborane is *o*-carborane, $C_2B_{10}H_{12}$, made by reaction of acetylene with

decaborane in the presence of diethyl sulfide. Its molecular structure resembles an icosahedron with the 10 boron atoms and 2 adjacent carbon atoms forming the apices.

Carborundum: see silicon carbide.

carboxylic acid, any of a class of organic compounds in which a carbon atom is bonded to an oxygen atom by a double bond and to a hydroxyl group by a single bond. A fourth bond links the carbon atom to a hydrogen atom or to some other univalent combining group. Carboxylic acids occur in nature and also can be synthesized. They are used as solvents and to prepare many chemical compounds.

A brief treatment of carboxylic acids and their derivatives follows. For full treatment, see *MACROPAEDIA: Chemical Compounds*.

The simplest carboxylic acid is formic acid, in which a single hydrogen atom is attached to the carboxyl group. Formic acid, used as a disinfectant, occurs naturally in the tissue of ants and stinging nettles. If a methyl group is attached to the carboxyl group, the compound is acetic acid, a dilute form of which is vinegar.

A major class of carboxylic acid derivatives is the esters. In these compounds the hydroxyl is replaced by oxygen and hydrocarbons. A major commercial ester is ethyl acetate. It is used as a solvent and as an ingredient in flavours and perfumes. Esters are usually formed by reacting carboxylic acids with alcohols, removing water in the process. Anhydrides, halides, peroxy acids, amides, hydrazides, and azides form another major class of carboxylic acid derivatives. Each is derived from a carboxylic acid and a second compound (a halogen acid, for example) by removal of water. Not only are carboxylic acids readily converted into derivatives but the derivatives also can be converted into one another.

Carboxylic acids can be classified according to structure. Generally they are classified as aliphatic (related to, or derived from, fat), with straight or branched hydrocarbons. Aliphatic carboxylic acids may be further subdivided into saturated (containing all single bonds between the carbons) or unsaturated (containing at least one multiple bond). Some carboxylic acids are aromatic—*i.e.*, they possess ring-structured hydrocarbons.

Carboxylic acids may also be classified by function. For example, many aliphatic acids, particularly those with even numbers of carbon atoms, are constituents of fats. They are commonly classed together as fatty acids.

The chief chemical characteristic of the carboxylic acids is their acidity. They are generally more acidic than other organic compounds containing hydroxyl groups but are generally weaker than the familiar mineral acids. The acidity results from the removal of a hydrogen atom, which bears a positive charge. This leaves a carboxylate anion, a molecular unit bearing a negative charge.

Carboxylic acids and their derivatives react chemically in two major ways. In one, the added group is attached to the carbon atom next to the carboxyl group. In the other, one group attached to the carbonyl atom is replaced by another. This is the way derivatives are converted from one type into another.

Carboxylic acids occur widely in nature. The fatty acids are components of glycerides, which in turn are components of fat. Hydroxyl acids such as lactic acid (found in sour-milk products) and citric acid (found in citrus fruits) and many keto acids are important metabolic products that exist in most living cells. Proteins are made up of amino acids.

There are several ways to synthesize carboxylic acids. These include oxidation, or removal of electrons from a primary alcohol. Another method is Grignard synthesis, which makes use of powerful organometallic reagents called Grignard reagents. In addition,

the acids can be synthesized from nitriles, which are nitrogen-containing derivatives of the carboxylic acids, and from esters.

Carboxylic acids and their derivatives have varied applications. In addition to its use as a disinfectant, formic acid is employed in textile treatment and as an acid reducing agent. Acetic acid is extensively used in the production of cellulose plastics and esters. Aspirin, the ester of salicylic acid, is prepared from acetic acid. Palmitic acid and stearic acid are important in the manufacture of soaps, cosmetics, pharmaceuticals, candles, and protective coatings. Stearic acid also is used in rubber manufacture. Acrylic acid is employed as an ester in the production of polymers (long-chain molecules) known as acrylates. Methacrylic acid serves as an ester and is polymerized to form Perspex or Plexiglas. Oleic acid is used in the manufacture of soaps and detergents and of textiles.

carbuncle, in medicine, a type of inflammatory staphylococcal infection of the skin. A carbuncle typically consists of two or more interconnected boils called furuncles; these are painful red nodules that form yellowish heads which burst to release pus and dead tissue. Carbuncles, however, are larger than furuncles, generally involve deeper layers of the skin, and have multiple openings for the drainage of pus. They occur most often in hairy skin areas or areas that are subject to friction—*e.g.*, the back of the neck, the armpits, and the buttocks.

While simple boils can be eliminated by the application of hot, moist dressings followed by washing with soap, carbuncles may have to be lanced and drained, a procedure that is often followed by antibiotic treatment. After the treatment, poor hygiene may lead to a recurrence.

carbuncle, in mineralogy, a deep red, cabochon-cut almandine, which is an iron aluminum garnet. See *almandine*.

carburetor, also spelled *CARBURETTOR*, device for supplying a spark-ignition engine with a mixture of fuel and air. Components of carburetors for automobile engines usually include a storage chamber for liquid fuel, a choke, an idling (or slow-running) jet, a main jet, a venturi-shaped air-flow restriction, and an accelerator pump. The quantity of fuel in the storage chamber is controlled by a valve actuated by a float. The choke, a butterfly valve, reduces the intake of air and allows a fuel-rich charge to be drawn into the cylinders when a cold engine is started. As the engine warms up, the choke is gradually opened either by hand or automatically by heat- and engine-speed-responsive controllers. The fuel flows out of the idling jet into the intake air as a result of reduced pressure near the partially closed throttle valve. The main fuel jet comes into action when the throttle valve is further open. Then the venturi-shaped air-flow restriction creates a reduced pressure for drawing fuel from the main jet into the air stream at a rate related to the air flow so that a nearly constant fuel-air ratio is obtained. The accelerator pump injects fuel into the inlet air when the throttle is opened suddenly.

Other components have been added to carburetors to reduce hydrocarbon emissions and improve fuel economy. A miniature electronic device called a microprocessor, as part of the engine system, can provide precise control of the intake air-fuel mixture on the basis of engine temperature, load, and speed.

carburizing, form of surface hardening (*q.v.*) in which the carbon content of the surface of a steel object is increased.

carcajou (mammal): see *wolverine*.

Carcassonne, town, capital of Aude *département*, Languedoc-Roussillon region, southwestern France, southeast of Toulouse, near

Medieval fortifications, the Cité, Carcassonne, Fr.
Club Iris

the eastward bend of the Aude River, which divides the city into two towns, the Ville Basse and the Cité. The Cité has the finest remains of medieval fortifications in Europe.

On the summit of an isolated hill rearing abruptly on the Aude's right bank, the site of the Cité was occupied as early as the 5th century BC by the Iberians, then by Gallo-Romans. The inner rampart was built AD 485 when Euric I was king of the Visigoths. Clovis failed to take it in 508, though Muslim invaders succeeded in 728, as did Pepin the Short in 752.

The viscounts of Carcassonne and Béziers built the Basilique Saint-Nazaire (1096–1150), and about 1125 the Château Comtal was incorporated into the Visigothic rampart. In 1247, as a consequence of the Albigensian Wars, the viscounts' possessions were confiscated by the French crown. Great art works were then undertaken. The cathedral's Romanesque transept and choir were replaced by Gothic structures (the Romanesque nave remains). The stained glass is from the 14th–16th centuries. The outer ramparts, also turreted, towered, and crenellated, were built during the reign of Louis IX and continued by his son Philip III, who also added to the inner walls the beautiful Porte (gate) Narbonnaise. The Porte, the only entry into the Cité by road, is guarded by two towers with projecting beaks and a double barbican that forced assailants to expose an undefended flank.

When Roussillon province was annexed to France in 1659, Carcassonne ceased to be a frontier fortress and was left to decay. In 1844 the architect and medievalist Viollet-le-Duc began reconstruction of the cathedral and the ramparts, work which continued until the 1960s. The Cité has about 1,000 inhabitants in its narrow, winding streets.

The Ville Basse was founded in 1240 when rebellious citizens of the Cité were banished beyond the walls. It was burned by Edward the Black Prince in 1355 when he failed to take the citadel. The church of Saint-Vincent and the cathedral of Saint-Michel, both 13th century, survive. Ville Basse is the business centre of modern Carcassonne. There is some light manufacture, but Carcassonne lives mainly on tourism. Pop. (1982) 38,379.

carcharhinid, any member of the shark family Carcharhinidae, which includes about 13 genera found worldwide, primarily in warm and temperate oceans but also, in some instances, in fresh or brackish water. The majority of living sharks are carcharhinids.

They are typically sharklike in appearance, characterized by two dorsal fins, an elongate upper tail lobe, and single-cusped, blade-shaped teeth. Like other sharks, carcharhinids are carnivorous, preying on fishes and various other animals. The species range in length from about 1.5 to 5.5 metres (4.5 to 18 feet). The classification of many, especially the gray sharks, or whalers (*Carcharhinus*), is uncertain and may be revised after further study.

A number of carcharhinids, such as the blue and tiger shark (*qq.v.*), are well known. Others are described below:

Blacktip shark, any of several species with dark fin tips; two potentially dangerous Atlantic species: the small blacktip (*Carcharhinus limbatus*), growing to about 2.5 metres, and the somewhat larger large blacktip, or spinner shark (*C. maculipinnis*). One small, inoffensive species, *C. melanopterus*, is found in shallow Indo-Pacific waters.

Bull shark (*Carcharhinus leucas*), also called cub, or ground, shark; inshore, western Atlantic; swims as much as 250 kilometres (about 160 miles) up rivers; blunt-snouted; pale to dark gray above, white below; to about 3.5 metres; potentially dangerous.

Lake Nicaragua shark, considered a race of bull shark by some; found in Lake Nicaragua; stout, blunt-nosed, gray; to 2.5 to 3 metres; potentially dangerous.

Bull shark (*Carcharhinus leucas*)
Bob Abrams—Bruce Coleman Inc.

Lemon shark (*Negaprion brevirostris*), common western Atlantic species; inshore, occasionally in fresh or brackish water; yellowish; to about 3.5 metres; potentially dangerous.

Soupin shark (*Galeorhinus zyopterus*), North American Pacific species once heavily fished for vitamin-rich liver oil; related to the school shark (*G. australis*), a valuable Australian food fish, and tope (*G. galeus*), a British sport fish; all three are gray or brownish, to about two metres long, and often found in schools.

Whitetip shark (*Carcharhinus longimanus*), Atlantic and Mediterranean species, primarily tropical; several similar forms, possibly of same species, in Pacific; long pectoral fins; large, rounded first dorsal fin; to 3.5 metres; gray, brown, or bluish with white fin tips; seldom near shore; potentially dangerous.

Carchemish, Roman EUROPEUS, ancient city-state near modern Jarābulus, in Ḥalab *muḥāfaẓah* (governorate), Syria. It commanded a strategic crossing of the Euphrates River for caravans engaged in Syrian, Mesopotamian, and Anatolian trade. The site, occupying more than 230 acres (93 hectares), was excavated (1911–20) by David G. Hogarth and later by Sir Leonard Woolley. Carchemish was first occupied in the Neolithic Period. Later finds included Uruk-Jamdat Nasr pottery, a product of the southern Euphrates Valley in Sumerian cities of about 3000 BC. The end of the Early Bronze (c. 2300 BC) and the Middle and Late Bronze Age (c. 2300–1550; c. 1550–1200 BC) were represented by tombs.

Written records concerning Carchemish first appear in the Mari letters (royal archives of Mari, c. 18th century BC), which include a mention of a king named Aplahanda. At that time the city was a trade centre for wood and appears to have engaged in the shipment of Anatolian timber down the Euphrates.

Later, the Hittite conqueror Suppiluliumas (c. 1375–35) established his son as king of the city, which he used as a buffer state against Assyria, Mitanni, and Egypt. With the fall of the Hittite Empire, Carchemish was probably

overrun by the Sea Peoples. The district finally capitulated to Sargon II of Assyria in 717. The last important historical event connected with it was the battle fought in 605 BC, at which the Babylonian king Nebuchadnezzar II expelled the Egyptians from Syria.

Excavation showed that the town was defended by thick double walls with strong towered gates. On the citadel, excavators found a rich series of orthostates (stone slabs set at the bottom of mud-brick walls), carved in an eclectic style peculiar to northern Syria. Many traits of Assyrian art, possibly brought by Hurrians from northern Syria, were also discerned at Carchemish.

Carchi, northernmost of the highland provinces of Ecuador, bounded by Colombia on the north. Its area is 1,496 sq mi (3,876 sq km). The population is concentrated around the provincial capital, Tulcán (*q.v.*), in the intermontane basin of Tulcán (altitude 9,800 ft [3,000 m]). The province is chiefly agricultural; in the basin, wheat, barley, and fruits are grown. At lower and medium elevations, corn (maize), sugarcane, and coffee are produced, and dairy cattle are raised. Sheep are pastured on the higher slopes. Sulfur mining is growing in importance, as is the production of pyrethrum for use in insecticides. The Pan-American Highway crosses the province from north to south. Pop. (1983 est.) 155,182.

carcinogen, any of a number of agents that can cause cancer, including chemicals, radiation, and viruses. Exposure to such agents, singly or in combination, can initiate cancer under conditions not wholly understood.

Chemical effluents from industry; environmental pollutants from automobiles, residences, and factories; and tobacco smoke bear carcinogens in varying degrees depending upon geographical location and climate. Physical carcinogens include ultraviolet rays from sunlight and ionizing radiation from X-rays and from radioactive materials in industry and in the general environment. A number of viruses are suspected of causing cancer in animals, including man, and are frequently referred to as oncogenic viruses (*see* oncogenic virus). Repeated local injury or recurring irritation to a part of the body can be carcinogenic.

Some—not all—cancers are heritable in the sense that a predisposition exists, awaiting a convergence of carcinogenic influences for cancer to manifest itself. The identification and timely elimination of carcinogens can reduce the incidence of cancer.

carcinoma, a cancerous growth or tumour of the epithelial tissues (the tissues covering the external surfaces of the body, lining the digestive tract and blood vessels, and making up the tissues or surface tissues of internal organs, including the liver, pancreas, thyroid gland, ovaries, and prostate gland), the malignant cells of which tend to invade surrounding healthy tissues and give rise to secondary growths (metastases) distant from the original tumour. Cancers of the skin, breast, mucous membrane, lung, and many internal organs and glands may be carcinomas; cancers of the nervous system, lymphatic system, blood, bone, and muscle are not.

Adenocarcinomas are carcinomas in which the cancerous cells are arranged in the form of glands. Stomach cancers are usually adenocarcinomas, arising out of the glandular cells of the stomach lining. The most common type of cancer of the pancreas also is the adenocarcinoma. Cancers of the prostate gland in men and of the ovaries in women are most commonly types of adenocarcinomas, as are many lung cancers.

card, playing: *see* playing card.

card game, a game played for pleasure or gambling (or both) with one or more decks of playing cards (*see* playing card). Card games are probably coeval with cards themselves and may have been invented by the Chinese when they began shuffling paper money into various combinations. The Chinese are thought to have played both for and with this money, and in China today the general term for playing cards means paper tickets.

Early playing cards proper were mostly numeral cards. In China they were used for games in which the higher cards captured the lower or in which they were formed into winning combinations. Those two principles are still the basis for the two great families of card games.

Circular cards from India are said to have been used on chessboards in a game of pure skill, from which games of chance evolved, but no book gives any account of them. A Persian game, *as nas*, has also been called a link in the development of modern games.

Cards and card games have been popular with all classes, despite sporadic attempts by monarchs, nobles, and governments to discourage their use by stringent laws. Both governments and churches condemned card playing in periods when gaming fever became widespread, bringing with it reckless wagering and a cruelly strict code of honour. Quarrels led to duels and to many causes célèbres, including the Tranby Croft Baccarat Scandal of 1890, a libel suit over charges of cheating, which, because it involved royalty, rocked Victorian England. In modern times the social and intellectual prestige of games such as bridge and the dwindling of gambling practices led to an abatement of objections to card playing.

The number of possible card games is practically unlimited, and a vast number of them have been devised. All depend either upon the concept of rank or that of cards in combinations. Some are designed for a specified number of players, a popular number being four; others may be played by any reasonable number. In most games a player's cards are known only to himself until exposed in conformity with the rules.

Games based on rank. In these games each card may defeat or be defeated by other cards when played to a trick. A trick consists of a card from each participant, usually played in clockwise rotation, although in games of Spanish origin, such as ombre, the cards are played and dealt counterclockwise. Each trick is taken by the highest-ranking card of the suit led. Often a trump suit, determined by the rules of the game, may predominate; in this case, any card of that suit may capture any card of the other suits. Except for the trump suit, suits have no order of precedence in the capture of tricks but may have relative values in other matters, such as scoring.

One of the earliest games of this type was an English game called triumph, popular in the 16th and 17th centuries, although it seems likely that similar French and Spanish games preceded it. A three-handed Spanish game, ombre, then became very fashionable, and this, in turn, was followed by a still-enduring family of games of which loo in England and spoil five in Ireland had by the 18th century become "national" games, while *écarté* in France, *napoleon* in England, and *euchre* in the United States achieved similar status in the 19th century and whist and the various forms of bridge did so in the 20th century.

Games based on combinations. In this family, which is of older lineage, the object is to acquire combinations of cards that have a prescribed scoring value, a principle seen in ancient Chinese dominoes. The popular example today is poker. Poker developed from

a long line of European games of which the first may have been *primero*, a Spanish game that the antiquary Joseph Strutt in *Sports and Pastimes of the People of England* (1801) believed to be the most ancient of the card games played in England. According to Shakespeare, *primero* was played by Henry VIII on the night Queen Elizabeth was born. From *primero* came the still-popular English game of brag, which was referred to as brag or *pocher* (German *pochen*, "to knock"). Modern poker, which first emerged in the United States in the early 19th century, became popular by virtue of its superior opportunities for calculation and psychology.

The other widely popular game based on grouping, or melding, cards in combinations is rummy and its countless variations. Instead of each deal ranking as a separate event as in poker, play is continuous. Scoring follows the principle that cards not melded (grouped) into scoring combinations when a critical point is reached are counted as penalty cards. One game of this family, *conquian*, or *coocan*, entered the United States from Mexico in the early 1900s. In 1949 *canasta*, invented in Latin America, spread rapidly to North America and Europe.

Games of both rank and combination. Trick play and melding have often been combined, notably in *piquet*, which has a courtly terminology that derives from a lengthy association with aristocrats and serious gamblers, especially in France. The game *bezique* is based on a similar idea but is played with two packs—sometimes more—and is a test of memory. Games of this type include the *pinochle* group, highly popular in the United States in its four-handed versions.

The solitaire or patience games. At least 350 variations of games for one person are known. They are played with either one or two decks. The game usually begins by releasing certain key cards and trying to build the remaining cards upon them in a prescribed order. Success or failure depends largely on the chance initial arrangement of the cards. Some solitaire games, however, especially those of the two-deck variety, contain an appreciable element of skill.

Children's and party games. The games for children are necessarily simple, as they must appeal to all age groups, and are seldom played in a serious frame of mind. Children enjoy them because they can compete with adults with a chance of winning. Most can be played by any reasonable number, and many games accentuate the element of suspense by giving each player three lives, after losing which he is out. Popular games include *slapjack*, *casino*, *concentration*, *old maid*, *beggar-my-neighbour*, *go fish* (or authors), and *spit*.

Casino games. The most widely played casino card games in Europe are *baccarat banque*, its more popular variant *chemin de fer*, or "chemmy," and *trente et quarante*; in the United States the single most popular casino card game is *blackjack* (twenty-one). All are derived from 15th- and 16th-century European games and have in common extreme simplicity in mechanics of play. The underlying principle is to assemble cards whose value does not exceed a specified number—9 in *baccarat*, 21 in *blackjack*—and to bet on the probability that the player or the bank will be successful.

For more information, *see* individual card games in the MICROPAEDIA.

cardamom, also spelled CARDAMON, spice consisting of whole or ground dried fruit, or seeds, of *Elettaria cardamomum*, a herbaceous perennial of the ginger family (Zingiberaceae). The seeds have a warm, slightly pungent, and highly aromatic flavour somewhat reminiscent of camphor. They are a popular seasoning in Oriental dishes, particularly curries, and in Scandinavian pastries.

Cardamom (*Elettaria cardamomum*)

W. H. Hodge

Native to the moist forests of southern India, cardamom fruit may be collected from wild plants; but most is cultivated in India, Sri Lanka, and Guatemala. Leafy shoots arise 1.5 to 6 m (5 to 20 feet) from the branching rootstock. Flowering shoots, approximately 1 m long, may be upright or sprawling; each bears numerous flowers about 5 cm (2 inches) in diameter with greenish petals and a purple-veined white lip.

The whole fruit, 0.8 to 1.5 cm, is a green, three-sided oval capsule containing 15 to 20 dark, reddish brown to brownish black, hard, angular seeds. They are picked or clipped from the stems just before maturity, cleansed, and dried in the sun or in a heated curing chamber. Cardamom may be bleached to a creamy white colour in the fumes of burning sulfur. After curing and drying, the small stems of the capsules are removed by winnowing. Decorticated cardamom consists of husked dried seeds. The essential oil occurs in large parenchyma cells underlying the epidermis of the seed coat. The essential oil content varies from 2 to 10 percent; its principal components are cineole and α -terpinyl acetate.

The name cardamom is sometimes applied to other similar spices of the ginger family (*Amomum*, *Aframomum*, *Alpinia*) used in cuisines of Africa and Asia or as commercial adulterants of true cardamoms.

Cardamom Hills, mountainous area in southeastern Kerala state, southern India, forming part of the Western Ghâts range. Some of their eastern peaks are more than 4,500 feet (1,370 m) high. The Cardamom Hills region produces tea, coffee, teak, and bamboo as well as the cardamom for which it is named. Most of its produce is shipped eastward through Tamil Nâdu state down the Kambam River valley. The name Cardamom Hills is sometimes used for the entire Western Ghâts range south of Pâlgât Gap.

Cardamom Mountains, French CHÂINE DES CARDAMONES (Cambodia); *see* Krâvnh Mountains.

Cardano, Gerolamo, Gerolamo also spelled GERONIMO, or GIROLAMO, English JEROME CARDAN (b. Sept. 24, 1501, Pavia, duchy of Milan [Italy]—d. Sept. 21, 1576, Rome), Italian physician, mathematician, and astrologer who gave the first clinical description of typhus fever and whose book *Ars magna* ("Great

Art") is one of the cornerstones in the history of algebra.

Educated at the universities of Pavia and Padua, Cardano received his medical degree in 1526. In 1534 he moved to Milan, where he lived in great poverty until he became a lecturer in mathematics. Admitted to the college of physicians in 1539, he soon became rector. His fame as a physician grew rapidly, and many of Europe's crowned heads solicited his services; however, he valued his independence too much to become a court physician. In 1543 he accepted a professorship in medicine in Pavia.

Cardano was the most outstanding mathematician of his time. In 1539 he published two books on arithmetic embodying his popular lectures, the more important being *Practica arithmetica et mensurandi singularis* ("Practice of Mathematics and Individual Measurements"). His *Ars magna* (1545) contained the solution of the cubic equation, for which he was indebted to the Venetian mathematician Niccolò Tartaglia, and also the solution of the quartic equation found by Cardano's former servant, Lodovico Ferrari. His *Liber de ludo aleae* ("Book on Games of Chance") presents the first systematic computations of probabilities, a century before Blaise Pascal and Pierre de Fermat. Cardano's popular fame was based largely on books dealing with scientific and philosophical questions, especially *De subtilitate rerum* ("The Subtlety of Things"), a collection of physical experiments and inventions, interspersed with anecdotes.

Cardano's favourite son, having married a disreputable girl, poisoned her and was executed in 1560. Cardano never recovered from the blow. From 1562 he was a professor in Bologna but in 1570 was suddenly arrested on the accusation of heresy. After several months in jail he was permitted to abjure privately, but he lost his position and the right to publish books. Before his death he completed his autobiography, *De propria vita* (*Book of My Life*). Modern biographies include A. Bellini, *Gerolamo Cardano* (1947), and Oystein Ore, *Cardano, the Gambling Scholar* (1953).

Cardenal, Ernesto (b. Jan. 20, 1925, Granada, Nicaragua), revolutionary Nicaraguan poet and Roman Catholic priest who is considered to be the second most important Nicaraguan poet, after Rubén Darío.

He was educated first at Jesuit schools in Nicaragua, then in Mexico and at Columbia University. Having undergone a religious conversion, in 1957 he entered the Trappist monastery at Gethsemane, Ky., transferred to the Benedictine monastery of Cuernavaca, Mex., and, after studying theology in a seminary at La Ceja, Colom., was ordained a priest in 1965 in Nicaragua.

His early poems, collected in *Epigramas* (1961), denounce the senseless violence of the Somoza regime in Nicaragua, while others are love poems written with a fine sense of irony. *La hora 0* (1960; *Zero Hour and Other Documentary Poems*), a long documentary poem denouncing the effects of domestic tyranny and American imperialism in Central American history, is a masterpiece of protest poetry. In subsequent works Cardenal began to use empty phrases and commercial slogans as symbols of an alienating world.

The poems in *Salmos* (1964; *Psalms of Struggle and Liberation*) represent Cardenal's rewriting of the biblical psalms of David and condemn modern-day evils. These poems, like many of his others, express the tension between his revolutionary political fervour and his religious faith. The book culminates in an apocalyptic view of the world, a theme that becomes an obsession in later works.

In *Oración por Marilyn Monroe y otros poemas* (1965; "Prayer for Marilyn Monroe and Other Poems"), the earlier prophetic tone is linked to contemporary events: the death of

the film actress Marilyn Monroe serves as an example of what Cardenal sees as the dehumanizing corruption of the capitalist system. Clichés, slogans, newspaper clippings, and advertisements in the poem become symbols of noncommunication.

Among his other volumes of poetry is *El estrecho dudoso* (1966; "The Doubtful Strait"), *Homenaje a los indios americanos* (1969; *Homage to the American Indians*), and *Oráculo sobre Managua* (1973; "Oracles About Managua"). *Vida en el amor* (1970; *To Live Is to Love*), a book of philosophical essays, and *En Cuba* (1973; *In Cuba*), recollections of his visit there in 1970, comprise his prose work. Volumes of his poetry have been translated into all the major European languages.

Cardenal took an active part in the Sandinista revolution that ousted Anastasio Somoza in July 1979, and he became minister of culture in the new government. In this post he sponsored popular workshops in poetry and theatre and promulgated Sandinista political ideals.

Cárdenas, city, northern Matanzas province, west-central Cuba. It is located on the shore of a large bay and is sheltered by the long Hicacos Peninsula. Cárdenas is one of Cuba's chief sugar ports. Founded in 1828, the settlement grew steadily after nearby marshes were drained. The city's industries include sugar refineries, rum distilleries, and factories manufacturing rope from henequen. Playa Varadero, a well-known beach-resort area, lies about 8 miles (12 km) north-northwest. Pop. (1986 est.) 78,300.

Cárdenas, Bartolomé de: see Bermejo, Bartolomé.

Cárdenas (del Río), Lázaro (b. May 21, 1895, Jiquilpan, Mex.—d. Oct. 19, 1970, Mexico City), president of Mexico (1934–40), noted for his efforts to carry out the social and economic aims of the Mexican Revolution. He distributed land, made loans available to peasants, organized workers' and peasants' confederations, and expropriated and nationalized foreign-owned industries.

Cárdenas was largely of Indian descent. After a rudimentary education, he received his first job in a local branch of the Public Revenue Office.

In February 1913 President Francisco Madero, who had led the struggle to overthrow the long dictatorship of Porfirio Díaz, was taken prisoner and assassinated on the orders of the rebellious general Victoriano Huerta, who now seized control of the government. Huerta's repressive military dictatorship provoked civil war almost immediately, and Venustiano Carranza headed the new revolutionary forces. At the age of 18, Cárdenas joined a branch of the revolutionary army led by General Guillermo García Aragón, and within a year he had risen to the rank of captain. When the revolutionary forces split into opposing factions, he remained loyal to Carranza, whose army triumphed in 1920. In that year Cárdenas was appointed general, the highest rank in the Mexican Army, and continued to participate in military campaigns until 1929.

Like most of the revolutionary military leaders, General Lázaro Cárdenas was also active politically, and in 1928, at the age of 33, he was elected governor of his native state of Michoacán. He served in that position for a full term, until 1932. Cárdenas also played an important role in forming a nationwide party to reinforce the revolutionary regime. Under the leadership of former president Plutarco Elías Calles, in office from 1924 to 1928, the Partido Nacional Revolucionario (PNR) was launched in 1929, and in the following year Governor Cárdenas was chosen to be the party's president. Cárdenas worked hard to transform the PNR from a loose federation of

state parties, each led by a military-political caudillo (boss), into a truly national party and a major element of stability in the revolutionary regime. Cárdenas was minister of the interior for six weeks in 1931 and minister of war and marine for five months in 1933. It was from the latter job that he retired to become the PNR's candidate for president in the 1934 election.

Lázaro Cárdenas
Archivo Casasola Mexico City

Cárdenas turned out to be an extraordinary presidential candidate. Although his election was assured, he spent the year between his nomination and polling day carrying out an intensive campaign. He visited virtually every city, town, and village in the country, meeting with local leaders and ordinary citizens and building up an extensive personal following in all parts of the country. During this campaign, he made clear his intention to carry out PNR's six-year plan of social and economic reform.

Once elected president, General Cárdenas moved cautiously at first. The army, the civil administration, and much of the political structure of the regime remained under the control of former president Calles, who had wielded vast influence while in power. During his first year in office, President Cárdenas spent much of his time establishing his own influence in these branches of the administration. Finally, he felt strong enough to have Calles sent into exile in the United States in 1936.

As president, Cárdenas carried out a wide range of reforms. Under the agrarian reform program, he distributed nearly twice as much land to peasants as had all of his predecessors combined, such that by the end of his administration about half of the country's cultivated land was held by previously landless farmers. He also extended the services of government banks so that the peasants who had received land under the reform could borrow money. In an effort to provide a political base for the land-redistribution program, he organized all of its beneficiaries in a new National Peasant Confederation (Confederación Nacional Campesina, CNC). This was but one more step in strengthening the general political structure of his new regime. Another major step in this direction was taken early in 1936 when most of the country's dispersed central labour groups were organized into the Confederación de Trabajadores de Mexico, which, for the next generation, continued to represent at least half of the country's organized workers.

Cárdenas also reorganized the government party. In 1938 a national convention restructured the party and renamed it the Partido de la Revolución Mexicana (PRM). Whereas in the past only government employees and aspiring politicians were members of the party, the new organizational scheme allowed mass groups to join the PRM directly. Four "sectors" of the party were established: labour,

peasant, "popular," and "military." Most national labour groups were affiliated with the first; the CNC constituted the second; a variety of middle-class groups made up the third; and the armed forces were incorporated into the last. In the next administration the military sector was suppressed, and since then the military role in Mexican politics has been reduced considerably.

The Cárdenas administration was best known outside Mexico for its efforts to expropriate foreign-owned industries. In 1937 the government expropriated the nation's principal railways, and in March 1938 President Cárdenas signed a decree nationalizing the country's oil industry. After short-lived experiments of putting both of these industries under the control of their workers' unions, they were placed under autonomous public corporations, which were to function more or less like any other large private industry.

When his term in office came to an end, President Cárdenas presided over the election of his successor, General Manuel Ávila Camacho. He intended to withdraw from active political life. With the outbreak of World War II, however, in which Mexico became an active participant early in 1942, Cárdenas returned to public office. He served as minister of national defense from 1943 to 1945, and in the last year of his term he was made commander in chief of the Mexican army. He retired once again late in 1945.

For the following 16 years, he held no public office. In 1961, however, Cárdenas became the executive member of the Commission of the Balsas River Valley, which ran one of the country's major regional electrification and development agencies, in the state of Guerrero. His sharply diminished responsibilities notwithstanding, he remained a major figure in national politics. He became the symbol of the left in the government party, which was renamed the Institutional Revolutionary Party in 1946. He remained the major supporter of the cooperative type of agrarian reform and the chief opponent of the United States' economic and political influence in Mexico. Cárdenas never withdrew from the government party, although he continued to support alternative political organizations. In the early 1960s he sponsored a rival group to the CNC, the Independent National Peasant Confederation (*Confederación Nacional Campesina Independiente*), and patronized—but never joined—a left-wing political coalition, the National Liberation Movement.

After the victory of the Fidel Castro revolution in Cuba in 1959, Cárdenas became the most forceful ally of the Cuban revolutionaries in Mexico. Basically, however, Cárdenas' political influence had substantially declined during the last years of his life. Nevertheless, he remained a highly controversial figure and a rallying point for those who were critical of the policies of succeeding administrations.

(R.J.AI.)

(1979); Henry A. Phillips, *New Designs for Old Mexico* (1939); J.H. Plenn, *Mexico Marches* (1939); Joe C. Ashby, *Organized Labor and the Mexican Revolution Under Lázaro Cárdenas* (1967); and Clarke Newton, *The Men Who Made Mexico* (1973).

cardiac arrhythmia, variation from the normal rate or regularity of the heartbeat, usually resulting from irregularities within the cardiac conduction system. Arrhythmias occur in both normal and diseased hearts and have no med-

ical significance in and of themselves, though they may endanger heart function when coupled with other cardiac abnormalities.

The most common arrhythmias are sinus arrhythmia, in which heart rate accelerates with the intake of breath and decelerates with expiration; tachycardia (*q.v.*), which is a regular acceleration of the heart rate; bradycardia (*q.v.*), a regular slowing of the heart rate; and premature atrial or ventricular beats, which are extra contractions within otherwise normal heart rhythm. While occasional irregularities are normal, prolonged or chronic arrhythmias associated with some forms of heart disease may reduce cardiac output, lowering blood pressure and affecting the perfusion of vital organs with blood, and can precipitate heart failure. Severe arrhythmias can trigger atrial or ventricular fibrillation, in which the heart beats ineffectively at many times its normal rate (*see* atrial fibrillation; ventricular fibrillation).

Cardiac arrhythmias reflect the failure of the sinus node, the normal cardiac pacemaker, to maintain a regular heartbeat, usually because of defects in the various pathways by which electrical impulses are carried to different areas of the heart. Anatomical defects or disease can slow down or speed up the propagation of electrical impulses, causing them to arrive out of the normal rhythm, or can turn the impulses back on their path, short-circuiting the pacemaker. Many arrhythmias can be corrected through cardioversion, in which an electric shock is applied to override abnormal impulses, or by drugs such as quinidine or digitalis, which directly affect the sensitivity of the heart muscle and the conduction rate of electrical impulses.

cardiac catheterization, procedure by which a flexible tube (catheter) is inserted into an artery or vein and passed along the course of that vessel into the heart. It is used for injecting drugs directly into the heart, for measuring the blood flow and the pressures in the heart and central blood vessels, in the diagnosis of congenital heart disease, in exploring narrowed passages and abnormal communications between heart chambers, and as a means of passing electrodes into the heart to restore or regulate the heartbeat. The procedure was originated by the German physician Werner Forssmann, who, in 1929, opened a vein in his own arm, inserted the tip of a catheter about 3.2 mm (0.125 inch) in diameter and 76 cm (2.5 feet) long, and passed it up his arm vein, along the intrathoracic veins, and on into the right atrium of his heart.

More recent is the technique of left-heart catheterization, which involves passing a catheter up an artery, against the direction of blood flow; while somewhat more difficult and hazardous than venous passage, it is an extremely valuable diagnostic procedure. *See also* angiocardiography; diagnostic imaging.

Cardiff, Welsh CAERDYDD, city and capital of Wales. It constitutes a separate county, which is part of the historic county of Glamorgan (Morgannwg). Cardiff is located on the Bristol Channel at the mouth of the River Taff, about 150 miles (240 km) west of London.

The Romans built a small fort (c. AD 75) at Cardiff, but the town began its continuous existence with the arrival of the Normans in the 11th century. The Norman noble Robert FitzHamon built a fortification on the site of the Roman fort during his expedition of 1090–93 against the Welsh. By 1150 a stone keep was erected on the mound—one of the finest surviving examples of its type in the country. Outside the castle a small walled town grew up, and it benefited from the trading privileges in a series of charters granted by either the local lord or the crown. Cardiff acted as a market centre and small port for the coastal plain nearby. The castle and lordship passed in 1766 to the earl (marquess since

Welsh National War Memorial in Cathays Park, Cardiff, Wales; civic buildings are in the background
Justin B. Ingram—Bruce Coleman Inc.

1796) of Bute. The Bute family renovated the castle as a residence and during the 20th century gave the city the castle and surrounding lands, part of which became the Civic Centre.

Cardiff's expansion stemmed from the development of coal and iron ore mines around Merthyr Tydfil, to the north, beginning in the second half of the 18th century. In 1794 the Glamorganshire Canal opened between Merthyr Tydfil and Cardiff, which subsequently became the major coal port of South Wales. In 1801 Cardiff's population was only 1,018, but the town developed rapidly and continuously over the next 100 years. The port was expanded in 1839 and railways that arrived in the 1840s connected Cardiff with the industrial and mining hinterland. Cardiff was designated a city in 1905. Its port was repeatedly expanded and by 1913 had become the largest coal-exporting port in the world.

In 1922 Cardiff's area was expanded to include Llandaff, with its cathedral. The port's coal trade fell off dramatically after 1918 and in 1963 ceased altogether, but Cardiff remained the largest city in Wales. It was officially recognized as the capital of Wales in 1955. Cardiff is the most important administrative, shopping, and cultural centre in the country, as well as the headquarters for many national organizations and government departments, including the National Assembly for Wales. It is also an important industrial centre—mainly for food processing, engineering, and light industries—and a hub for commerce and other services.

Cardiff has many notable buildings, though few historic ones, with the main exceptions of the castle, Llandaff Cathedral, and the medieval parish church of St. John. The Civic Centre in Cathays Park is a fine set of public buildings, built since 1904, and set among ornamental gardens and broad avenues. Among the notable buildings are the city hall, the law courts, the Welsh National Museum, the Welsh National War Memorial, and the University of Wales, Cardiff. The docklands of the former port were redeveloped during the 1990s. The Welsh Folk Museum is housed in St. Fagan's Castle, 4.5 miles (7 km) west of the city centre. Area 54 square miles (139 square km). Pop. (1998 est.) 320,900.

Cardiff Giant, famous hoax perpetrated by George Hall (or Hull) of Binghamton, N.Y. A block of gypsum was quarried near Fort Dodge, Iowa, and shipped to Chicago. There it was carved (1868) in the shape of a human figure and then buried on a farm near Cardiff, N.Y. "Discovered" (1869) by well diggers, the statue was alleged to be a 10-foot (3-metre) petrified prehistoric man, until the hoax was exposed by the American paleontologist Othniel C. Marsh.

Cardigan, Welsh ABERTEIFI, town, Ceredigion county, southwestern Wales. The town grew up adjacent to a 12th-century Norman

castle overlooking the River Teifi. An arched bridge across the river is said to date from 1136. In 1176 the Welsh prince and justiciar Lord Rhys (Rhys ap Gruffudd) sponsored the first recorded national *Eisteddfod* (bardic assembly for poetry and music) of Wales, in the castle precinct. The town's first charter was granted in 1284. Cardigan served as a local market centre and small port but declined during the 19th century; its role as county town of the former Cardiganshire also declined with the growth of Aberystwyth, 40 miles (64 km) northeast. Cardigan is a modest tourist centre, close to attractive scenery. The River Teifi and its tributaries provide good fishing. Pop. (2001) 4,203.

Cardigan, James Thomas Brudenell, 7th Earl of, BARON BRUDENELL OF STONTON (b. Oct. 16, 1797, Hambleden, Buckinghamshire, Eng.—d. March 27/28, 1868, Deene Park, Northamptonshire), British general who led the charge of the Light Brigade of British cavalry against the Russians in the Battle of Balaklava, Oct. 25, 1854, during the Crimean War—an incident immortalized in Alfred, Lord Tennyson's poem "The Charge of the Light Brigade" (1855).

Educated at Christ Church, Oxford, he entered the army in 1824, at a later age than was then usual, and quickly purchased promotion, becoming lieutenant colonel of the 15th Hussars by 1832. A tempestuous martinet, he quarreled with his officers, illegally placing one under arrest, and was court-martialed and forced to give up his command (1834). But in

Cardigan, detail of an engraving by G. Fobel after a portrait by H.W. Phillips

1836 family influence secured him the command of the 11th Light Dragoons (renamed the 11th Hussars in 1840). He inherited his father's earldom and fortune in 1837. By spending an estimated £10,000 a year from his private purse, he made the regiment the smartest in the service (he introduced what came to be called the cardigan jacket); but again there was trouble because of his severity toward his officers, which led to a duel with one of them, who was wounded. Cardigan faced public anger by demanding trial by his peers and won his case on a technical point of law. He retained command of his regiment until his promotion to major general in 1854.

On the outbreak of the Crimean War (1854) he was appointed commander of the Light Brigade, under his brother-in-law G.C. Bingham, 3rd Earl of Lucan, with whom he was on bad terms. His brigade saw little action before Oct. 25, 1854, when the celebrated charge of the Light Brigade took place (see Balaklava, Battle of). Although Cardigan queried the ambiguous order from Lord Raglan that originated the charge, he did not hesitate when the order was repeated but led the maneuver steadily and gallantly. The charge so struck the imagination of the British public that Cardigan was lionized on his return to England, where he was appointed inspector general of cavalry. Later, when Lieutenant Colonel Som-

erset J.G. Calthorpe published a book falsely asserting Cardigan had not led the charge, he sued the author for libel but was nonsuited on a technicality.

to north-northeast. Two national parks, Snowdonia and Pembrokeshire Coast, incorporate substantial stretches of beach and cliff along the shoreline. Coastal resort towns include Pwllheli and Criccieth on the Lleyrn Peninsula; historic Harlech with its castle and dunes; Barmouth by the Mawddach Estuary; Aberdovey, associated in Welsh folklore ("The Bells of Aberdovey") with the submergence of a land beyond the present coastline; Aberystwyth, the major town of west-central Wales; and Fishguard, a base for seaborne trade and ferry service between Wales and Ireland.

Cardiganshire, also called **CARDIGAN**, **Welsh SIR ABERTEIFI**, or **CEREDIGION**, a former county of southern Wales facing the Irish Sea. In the reorganization of 1974 it was included in the northern sector of the county of Dyfed. The historic county of Cardiganshire is coterminous with the current county of Ceredigion.

The earliest human remains in Cardiganshire are found on the high ground, and there is evidence of a Roman trackway. The post-Roman centuries were marked by many raids on the coast by Irish and Scandinavians. The whole basin of the Teifi is said to have fallen to Ceredig, son of Cunedda Wledig of northern Wales; and the name Cardiganshire was derived from Ceredig's name. During the 12th and 13th centuries Welsh herdsmen and encroaching Normans skirmished repeatedly. In the early 15th century Owen Glendower held court at Aberystwyth Castle. England's Edward I constituted Ceredigion as a shire on the English model. During the reign of Henry VIII, the county's boundaries were enlarged.

During the English Civil Wars the castles of Cardigan and Aberystwyth were reduced to ruins by the Cromwellian forces. In the 18th century the county became the centre of the Methodist movement. The 17th and 18th centuries also saw the coastal towns enjoy brisk trade, chiefly with Bristol. Ultimately, however, the Industrial Revolution destroyed local industries and seafaring activity, and many towns in the county became summer resorts.

Cardin, Pierre (b. July 7, 1922, Venice, Italy), French designer of elegantly cut clothes for women and also a pioneer in the design of high fashion for men.

Cardin's father, a wealthy French wine merchant, wished him to study architecture, but from childhood he was interested in dress-making. At 17 he went to Vichy, France, to become a tailor at a men's shop. After World War II he joined the Parisian fashion house of Paquin, where he designed the costumes for Jean Cocteau's film *Beauty and the Beast*. At

the designing establishment of Christian Dior (1947–50) he became one of the designers of the "New Look" (1947) and created his famous "Bar" suit with long, black skirt and fitted jacket in natural shantung.

In 1950 he opened a shop to design creations for the popular Parisian costume balls, but he continued to create a limited number of fashions for men and women. He gradually gained a solid reputation as a men's suit maker and branched into whimsical accessories for men. In 1959 he created the first ready-to-wear collection for women ever presented by a top designer and in 1960 introduced the first designer ready-to-wear collection for men. He showed himself a master of the bias cut, soft semifitted lines, and lavish colour. In the late 1960s his stark, short tunics, and his use of vinyl, helmets, and goggles launched the Space Age look. His ready-to-wear line of men's

Cardin in a sleeveless dinner jacket of his own design

clothing has especially influenced other designers of male attire, such as the American Bill Blass.

cardinal, a member of the Sacred College of Cardinals, whose duties include electing the pope, acting as his principal counselors, and aiding in the government of the Roman Catholic church throughout the world. Cardinals serve as chief officials of the Roman Curia (the papal bureaucracy), as bishops of major dioceses, and often as papal envoys. They wear distinctive red attire, are addressed as "Eminence," and are known as princes of the church.

Scholars have disagreed about the origin of the title. There is, however, tentative consensus that the Latin word *cardinalis*, from the word *cardo* ("pivot" or "hinge"), was first used in late antiquity to designate a bishop or priest who was incorporated into a church for which he had not originally been ordained. In Rome the first persons to be called cardinals were the deacons of the seven regions of the city at the beginning of the 6th century, when the word began to mean "principal," "eminent," or "superior." The name was later given to the senior priest in each of the "title" churches (the parish churches) of Rome and to the bishops of the seven sees surrounding the city.

By the 8th century the Roman cardinals constituted a privileged class among the Roman clergy. They took part in the administration of the church of Rome and in the papal liturgy. By decree of a synod of 769, only a cardinal was eligible to become pope. In 1059, during the pontificate of Nicholas II (1059–61), cardinals were given the right to elect the pope. For a time this power was assigned exclusively to the cardinal bishops, but the third Later-

an Council (1179) restored the right to the whole body of cardinals. The cardinals were granted the privilege of wearing the red hat by Innocent IV (1243–54) in 1244 or 1245; it has since become their symbol.

In cities other than Rome, the name *cardinal* began to be applied to certain ecclesiastics as a mark of honour. The earliest example of this occurs in a letter sent by Pope Zacharias (741–752) in 747 to Pippin III (the Short), ruler of the Franks, in which Zacharias applied the title to the priests of Paris to distinguish them from country clergy. This meaning of the word spread rapidly, and from the 9th century various episcopal cities had a special class among the clergy known as cardinals. The use of the title was reserved for the cardinals of Rome in 1567 by Pius V (1566–72), and Urban VIII (1623–44) granted them the official style of Eminence in 1630.

The Sacred College of Cardinals, with its structure of three orders (bishops, priests, and deacons), originated in the reform of Urban II (1088–99). These ranks within the college do not necessarily correspond to a cardinal's rank of ordination; e.g., the bishop of a diocese such as New York City or Paris may be a cardinal priest. From the time of the Avignon papacy (1309–77), the lack of internationality in the College of Cardinals became an increasingly important issue; a reform under Sixtus V (1585–90) attempted to provide for it. The question continued to be raised at various times, particularly in the second half of the 20th century.

The cardinal bishops are the successors of the bishops of the sees just outside Rome. There were seven of these sees in the 8th century, but the number was later reduced to six. Prior to 1962 each of the cardinal bishops had full jurisdiction in his own see; afterward, however, they retained only the title without any of the functions, which were performed by a bishop actually resident in the see. In 1965 Paul VI (1963–78) created cardinals from among the Eastern Catholic patriarchs and arranged that they should become cardinal bishops on the title of their patriarchal sees.

The second and largest order in the College of Cardinals is that of the cardinal priests, the successors of the early body of priests serving the title churches of Rome. Since the 11th century this order has been more conspicuously international than the orders of cardinal bishops and deacons, including the bishops of important sees throughout the world.

The cardinal deacons are the successors of the seven regional deacons. By the 10th–11th century there were 18 deaconries in the city, and the reform of Urban II assigned a cardinal deacon to each of them. Originally, the order was limited to those who had advanced no further than the diaconate. Later legislation prescribed that a cardinal deacon be at least a priest. John XXIII (1958–63) and Paul VI, after appointing cardinal deacons who were not bishops, immediately consecrated them bishops.

The pope alone appoints or creates cardinals in the three orders of cardinal bishop, cardinal priest, and cardinal deacon—all of whom are bishops in accordance with the ruling of John XXIII—by announcing their names before the College of Cardinals in a private consistory (a meeting of ecclesiastics, especially the College of Cardinals, for the administration of justice and other business). These newly named cardinals then receive the red biretta and the ring symbolic of the office in a public consistory. Sometimes the pope appoints cardinals *in pectore* (Latin: “in the breast”), without declaring their names; only when the name of a cardinal *in pectore* is revealed does he assume the rights and duties of the office.

In 1586 Sixtus V set the total number of car-

dinals at 70, of whom 6 were cardinal bishops, 50 were cardinal priests, and 14 were cardinal deacons. In 1958 John XXIII eliminated the restriction of 70, increasing the number of cardinals to 87, and since then the number has reached more than 100.

Under the influence of the Second Vatican Council (1962–65) and in recognition of the need for greater internationalization of the College of Cardinals, Paul VI and John Paul II (1978–2005) appointed many new cardinals; under Paul there were 145, and under John Paul there were 182, nearly all of whom had been appointed by him. The growth of the college, however, prompted the imposition of new restrictions on the cardinalate. By a directive of Paul VI in 1970, cardinals who reach age 75 are asked to resign, and those who do not resign relinquish the right to vote for a pope when they reach age 80. Paul further decreed that the number of voting cardinals be limited to 120. This restriction was confirmed during the pontificate of John Paul II. In 1996 a new set of rules issued by John Paul provided that, under certain circumstances, the long-required majority of two-thirds plus one for election of a pope could be superseded by a simple majority.

cardinal, also called REDBIRD, or CARDINAL GROSBEAK (species *Cardinalis*, formerly *Richmondia*, *cardinalis*), songbird of North America east of the Rocky Mountains, belonging to the family Fringillidae (placed by some authors in the Emberizidae; order Passeriformes). It is 20 cm (8 inches) long, with

Cardinal (*Cardinalis cardinalis*)
Stephen Collins

pointed crest; the male is bright red, the female being a duller reddish or olive brown. Pairs of these birds utter loud, clear whistling notes year-round in gardens and open woodlands. They feed on insects (and thus are beneficial for pest control) and on wild seeds and wild fruits. The cardinal is especially abundant in the southeastern United States and has been introduced into Hawaii, southern California, and Bermuda.

cardinal fish, any fish of the family Apogonidae (order Perciformes), a group including about 200 species of small, typically nocturnal fishes found in tropical and subtropical waters. The majority of cardinal fishes are marine and live among reefs in shallow water. Some, such as *Astrapogon* (or *Apogonichthys*) *stellatus* of the Caribbean, take shelter in the shells of living conchs. Cardinal fishes range from 5 to 20 cm (2 to 8 inches) in length and are characterized by two dorsal fins, a large mouth, large eyes, and large scales. Many are red or reddish; others may be silvery, brownish, or black.

cardinal flower, any of several closely related species of the genus *Lobelia*, perennial plants of the family Lobeliaceae that are native to North and Central America. All bear spikes of scarlet, lipped flowers on leafy stems up to 1.5 m (5 feet) tall. *L. cardinalis* and *L. splendens*, considered to be one species by some authorities, are taller than *L. fulgens*, the Central American parent species of the garden cardinal flower. The blue cardinal (*L.*

Cardinal flower (*Lobelia cardinalis*)

siphilitica) is smaller than the others and has blue or whitish flowers.

cardinal sin: see deadly sin.

cardiology, medical specialty dealing with the diagnosis and treatment of diseases and disorders of the heart. Cardiology first became a specialized field of study when Jean Baptiste de Sénac in 1749 published a summary of contemporary knowledge of the heart. This was followed 12 years later by Leopold Auenbrugger's discovery that the condition of the heart can be estimated by the sound returned from tapping on the chest (percussion). Listening to heart sounds became a major part of medical diagnosis after René Laënnec's invention of the stethoscope in 1816.

Much of the development of cardiology during the 19th century consisted of improved diagnostic methods. An important diagnostic advance was Willem Einthoven's invention in 1903 of the electrocardiograph, which measures the heart's electrical activity; by 1915 the basic methods of diagnosis of heart disease, including fluoroscopic studies of the beating heart, were in place. Various advances in diagnostic technology opened up the possibility of surgical correction of many heart problems.

Cardiology itself remains a medical, not a surgical, specialty although cardiologists work closely with surgeons in cases of heart surgery. Cardiologists provide the continuing care of heart patients, performing basic studies of heart function and supervising all aspects of therapy, including the administration of drugs to modify heart functions.

Much of the development of cardiac medicine in the second half of the 20th century has been in the field of heart surgery. Major advances in this field have included the routine repair of coronary artery disease, one of the major causes of heart attacks; the first human heart transplant, performed by Christiaan Barnard of South Africa in 1967; and the development of a permanently functioning, surgically implanted artificial heart by a research team at the University of Utah, first used in 1982.

cardiopulmonary resuscitation (CPR), emergency procedure designed to restore normal breathing and circulation after such traumas as cardiac arrest and drowning. CPR involves clearing the air passages to the lungs and carrying out external heart massage by the exertion of pressure on the chest.

CPR procedures should be performed only on

unconscious individuals who are not breathing and only by those who have training in CPR methods. The first step in CPR is to open the airway by placing the individual on his back on a rigid surface, clearing foreign matter from the mouth or airway, and tilting the head back so that the chin is elevated. The second step involves mouth-to-mouth resuscitation—clamping the victim's nostrils, making an airtight seal over his mouth and breathing into it about 12 times per minute, allowing for natural exhalation. The third step is to check one of the carotid arteries (large blood vessels located on either side of the larynx) for a pulse. Absence of a pulse requires artificial circulation of the blood by means of external chest compressions (at the rate of about 80 per minute for adults). The recommended ratio of chest compressions to breaths administered is 15:2. CPR should continue uninterrupted until normal breathing and circulation are restored or until advanced professional medical assistance can be obtained. The procedure is modified somewhat for infants and children and under special circumstances (such as additional injury).

cardiovascular system, organ system that conveys blood to and from all parts of the body, carrying nutrients and oxygen to the tissues and removing wastes and carbon dioxide.

A brief treatment of cardiovascular systems follows. For full treatment, see *MACROPAEDIA: Circulation and Circulatory Systems*. For a depiction of some of the structures that make up the human cardiovascular system, shown in relation to other parts of the gross anatomy, see the colour *Trans-Vision* in the *PROPAEDIA: Part Four, Section 421*.

The cardiovascular system is essentially a closed tube through which blood moves in a double loop. Its chief structures are the heart, a muscular pump that propels blood around the circuit; the arteries, thick-walled vessels that carry blood outward from the heart; veins, thinner-walled vessels that return blood to the heart; and the capillaries, minute blood passages connecting the arteries and veins, in which nutrients and wastes are exchanged between the blood and tissues.

The cardiovascular system is necessary only to animals of some size and complexity because in small animals physical diffusion is adequate to transport nutrients to the body. Hence, though the circulatory system is found in the larger and higher invertebrates, it reaches a complex development only in the vertebrates. It is filled with blood, which travels in a circuit passing through respiratory organs for the exchange of gases and close to the excretory organs for the emission of wastes.

The adult human heart is suspended in the chest cavity within a tough, membranous sac, the pericardium, which contains a fluid that cushions the beating organ. The heart muscle (myocardium) is made up of unique muscle fibres that spontaneously contract to squeeze the blood out of the four main cavities, or chambers, of the heart. Blood first enters the right atrium, a relatively thin-walled muscular chamber that accepts blood returning to the heart from most of the body. It then passes into the right ventricle, a more muscular cavity that pumps blood to the lungs to be oxygenated. On returning from the lungs, the blood enters the left atrium and from there flows into the left ventricle, the largest of the heart's four chambers and the chief pump forcing blood to distant tissues. The atria and ventricles are separated by tissue valves that prevent backflow of blood during ventricular contractions; similar valves at the exits from the ventricles prevent blood from surging back into the chamber when it is relaxed.

The heart contracts in two steps. First, the two atria distend to accept the inflow of blood from the veins, then contract to force the blood into the ventricles. A second, stronger

contraction by the ventricles closes the atrioventricular valves and squeezes the blood out through the arteries. All heart muscle contracts without any outside stimulation, but an electroconductive tissue (the Purkinje fibres) in the myocardium triggers rhythmic beats to provide maximum contractile efficiency.

From the left ventricle, blood enters the aorta, the largest artery in the circulatory system. Two coronary arteries branch off almost immediately to supply blood to the myocardium; farther along, the aorta gives off the innominate, left carotid, and left subclavian arteries, which carry blood to the head, neck, and arms. The aorta then turns downward, sending arterial branches to the chest and abdominal organs as it descends, finally dividing into the iliac arteries supplying the legs.

As arteries branch off, the diameter of the new vessels becomes progressively smaller. The small arteries, called arterioles, feed into the microscopic capillary beds, where the vessel walls are but a few microns thick. The thin capillary walls act as a semipermeable membrane, allowing small molecules such as oxygen, water, carbon dioxide, and glucose to pass in both directions. Nutrients diffuse outward through this membrane while tissue waste products diffuse in, to be carried to the kidneys, liver, and lungs for removal from the body.

Capillaries converge to form small venules, which eventually join to become larger veins, generally following the same path as the arteries. Because most of the pressure of the heart contractions has been attenuated by the time the blood passes through the capillaries, fluid pressure in the veins is fairly low, so the vessels contain a number of valves that help control the direction of flow.

Blood from the venous network eventually reaches the heart through the superior and inferior venae cavae, from the upper and lower body respectively, which empty into the right atrium. That blood is expelled through the right ventricle into the short pulmonary artery leading to the lungs. The capillaries of the lungs are organized around the air pockets or alveoli at the end of the airway passages, so that carbon dioxide is given up by the blood into the air and oxygen is taken up. The oxygenated blood then returns to the left atrium through the pulmonary vein.

Diseases of the heart and blood vessels are a major source of human mortality and morbidity. The single largest cause of death in developed countries is atherosclerotic heart disease, in which the buildup of fatty deposits in the coronary arteries closes off the blood supply to part of the myocardium, destroying vital heart tissue. Atherosclerosis also contributes to strokes by narrowing the arteries supplying the brain, thus making them susceptible to blockage by spasm or blood clots. Other major diseases of the cardiovascular system include congenital heart diseases, rheumatic heart disease, and vascular inflammation.

cardoos (*Cynara cardunculus*), thistlelike perennial herb of the family Asteraceae, native to southern Europe and North Africa, where it is used as a vegetable. Its blanched inner leaves and stalk (called the chard, though not to be confused with Swiss chard, or leaf beet) and thick main roots are usually boiled, seasoned, and served chilled in salads.

Besides common and Spanish cardoos, there are also prickly-leaved Tours cardoos, red-stemmed cardoos, and Paris cardoos, these latter being the largest and most tender. The species was introduced into South America and has gradually spread over great areas of the pampas.

Cardoso, Fernando Henrique (b. June 18, 1931, Rio de Janeiro, Brazil), Brazilian sociologist, teacher, and politician, who was president of Brazil from 1994 to 2003.

Cardoso became a professor at the Univer-

sity of São Paulo in 1958, but the military government that took power in 1964 blacklisted him, and he went into exile, teaching at universities in Santiago, Chile, and Paris. He returned to Brazil in 1968, founded the Brazilian Centre for Analysis and Planning, and became one of the foremost members of the left-wing opposition. In 1986 Cardoso was elected senator from São Paulo, and in 1988 he cofounded the centre-left Brazilian Social Democratic Party. In 1992 he resigned his Senate seat to become foreign minister. The following year he was named finance minister, overseeing negotiations that produced a number of anti-inflation measures.

Cardoso ran for president in 1994 and with the support of the business community won a decisive victory. During his administration he emphasized economic reform, including privatization and increased foreign investment, as well as funding for education and social services. In 1997 voters approved a constitutional amendment that allowed the president to hold consecutive terms, and in 1998 Cardoso was reelected. By this time, however, Brazil was facing severe financial problems, and Cardoso was forced to pursue an austerity plan. Barred constitutionally from seeking a third consecutive term, Cardoso left office in 2003.

Cardozo, Benjamin Nathan (b. May 24, 1870, New York, N.Y., U.S.—d. July 9, 1938, Port Chester, N.Y.), American jurist, a creative common-law judge and legal essayist, who influenced the trend in U.S. appellate judging toward greater involvement with public policy and consequent modernization of legal principles. Generally a liberal, he was less concerned with ideology than with the nature of the judicial process itself; largely for this reason, his importance, while universally conceded, is difficult to fix precisely. Although he was esteemed for his service as an associate justice of the United States Supreme Court (1932–38), he was probably more significant for his work on the highest state tribunal in New York, the Court of Appeals (1914–32; chief judge from 1926).

A member of a distinguished Sephardic Jewish family, Cardozo enjoyed an unblemished personal reputation, although his father, Albert Jacob Cardozo, a New York Supreme Court justice with Tammany Hall connections, had resigned in 1872 under threat of impeachment. Admitted to the New York bar in 1891, Benjamin Cardozo was highly successful as a courtroom lawyer despite his mild, reserved manner. Elected to the state Supreme Court as a reform candidate in 1913, he was quickly promoted to the Court of Appeals. During his tenure, the quality of this appellate bench was thought by many to exceed that of the U.S. Supreme Court. In *MacPherson v. Buick Motor Company* (1916), Cardozo announced

Cardozo

By courtesy of the Library of Congress, Washington D.C.

a doctrine that was later adopted elsewhere in the United States and in Great Britain: an implied warranty of safety exists between a

manufacturer and a private purchaser, despite intermediate ownership of the product by a retail dealer.

After the resignation (Jan. 12, 1932) of Justice Oliver Wendell Holmes, President Herbert Hoover appointed Cardozo to the U.S. Supreme Court. In the New Deal period under President Franklin D. Roosevelt, Cardozo usually was bracketed with the liberally inclined Justices Louis D. Brandeis and Harlan Fiske Stone. He wrote a majority opinion for *Helvering v. Davis*, 301 U.S. 619, and other Social Security cases (1937), upholding the federal Social Security program on the basis of the general welfare provision of the Constitution (Article I, section 8). In *Palko v. Connecticut*, 302 U.S. 319 (1937), a criminal case involving a claim of double jeopardy, he held that the Fourteenth Amendment (1868) to the Constitution imposed on the states only those provisions of the Bill of Rights (the first 10 amendments, 1791) that were "of the very essence of a scheme of ordered liberty." Although it offered a minimum of guidance and may have encouraged much more constitutional litigation than would a specific standard, this test was retained by the court through the 1960s. In 1969, however, the *Palko* ruling was reversed by the court (*Benton v. Maryland*), which held that the rule against double jeopardy was so fundamental to justice as to be a requirement of due process of law.

Cardston, town, southwestern Alberta, Canada, on Lee Creek, near the U.S. (Montana) border, 47 miles (75 km) southwest of Lethbridge. Founded by Mormons from Utah in 1887, it was named for Charles Ora Card (Brigham Young's son-in-law), who led the wagon train from Utah and who played an important role in the development of irrigation from the nearby St. Mary River (now dammed to form St. Mary Reservoir). Cooperative farming, on which the town was built, still flourishes, and a cattle-grain economy prevails. The town's white granite Mormon temple (built 1913–23) is the only one of its kind in Canada; octagonal in a double Maltese cross ground plan, it is 110 feet (34 m) high. In 1888 the North West Mounted Police established a post at Cardston, which was incorporated as a village in 1898 and as a town in 1901, with Card (whose cabin on Main Street has been preserved) as its first mayor. Pop. (1991) 3,480.

Carducci, Giosuè (b. July 27, 1835, Val di Castello, near Lucca, Duchy of Lucca [Italy]—d. Feb. 16, 1907, Bologna, Italy), Italian poet, winner of the Nobel Prize for Literature in 1906, and one of the most influential literary figures of his age.

The son of a republican country doctor, he spent his childhood in the wild Maremma region of southern Tuscany. He studied at the University of Pisa and in 1860 became professor of Italian literature at Bologna, where he lectured for more than 40 years. He was made

Giosuè Carducci

By courtesy of the Biblioteca dell'Archiginnasio, Bologna, photograph, Fotofast

a senator for life in 1890 and was revered by the Italians as a national poet.

In his youth Carducci was the centre of a group of young men determined to overthrow the prevailing Romanticism and to return to classical models. Giuseppe Parini, Vincenzo Monti, and Ugo Foscolo were his masters, and their influence is evident in his first books of poems (*Rime*, 1857; later collected in *Juvenilia* and *Levia gravia*, 1868 ["Light and Serious Poems"]). He showed both his great power as a poet and the strength of his republican, anticlerical feeling in his hymn to Satan, "Inno a Satana" (1863), and in his *Giambi ed epodi* (1867–69; "Iambics and Epodes"), inspired chiefly by contemporary politics. Its violent, bitter language reflects the virile, rebellious character of the poet. *Rime nuove* (*The New Lyrics*) and *Odi barbare* (*The Barbarian Odes*), which appeared in the 1880s, contain the best of Carducci's poetry: the evocations of the Maremma landscape and the memories of childhood; the lament for the loss of his only son; the representation of great historical events; and the ambitious attempts to recall the glory of Roman history and the pagan happiness of classical civilization. Carducci's enthusiasm for the classical in art led him to adapt Latin prosody to Italian verse, and his *Odi barbare* are written in metres imitative of Horace and Virgil. Carducci's research in Italian literature was warmed by his poetic imagination and style, and his best prose works equal his poetry.

Carducci, Vincenzo, Spanish VICENTE CARDUCHO (b. 1578, Florence [Italy]—d. 1638, Madrid), Italian-born painter.

Carducci was the brother of artist Bartolommeo Carducci, whom he accompanied to Spain in 1585. Vincenzo succeeded his brother in 1609 as court painter to Philip III. Trained by his brother in the style of Italian Mannerism, he was one of the leading artists in Madrid until the arrival of Velázquez. Vincenzo painted three battle scenes for the Buen Retiro palace (now in the Prado Museum), but he was chiefly a religious painter. He wrote the *Diálogos de la Pintura* (1633), an academic treatise on art.

Carduelidae, songbird family, order Passeriformes, consisting of about 112 species of gregarious songbirds found in woodlands and brushlands worldwide, except in the Pacific Islands.

Members range in size from 10 to 25 cm (4 to 10 inches) long. They have pointed bills and rounded wings. Most are small birds with strong, undulating flight, during which they sing. They flit about searching chiefly for seeds, buds, berries, and, occasionally, insects. Among the notable members are: goldfinches and siskins (*Carduelis*), redpolls (*Acanthis*), rosefinches (*Carpodacus*), crossbills (*Loxia*), bullfinches (*Pyrrhula*), and canaries (*Serinus*). This large group of active little birds is sometimes classified as a subfamily (*Carduelinae*) in the family of finches (Fringillidae). It belongs to the songbird suborder (Passeres).

Cardwell (of Ellerbeck), Edward Cardwell, Viscount (b. July 24, 1813, Liverpool, Eng.—d. Feb. 15, 1886, Torquay, Devon), British statesman who, as secretary of state for war (1868–74), was considered to be the greatest British military reformer of the 19th century, modernizing the organization and equipment of the British army in the face of strenuous opposition at home.

The son of a Liverpool merchant, Cardwell was educated at Winchester and at Balliol College, Oxford. A lawyer from 1838 and a member of the House of Commons from 1842, he served as president of the Board of Trade (1852–55), chief secretary for Ireland (1859–61), chancellor of the duchy of Lancaster (1861–64), and secretary for the colonies (1864–66). In 1868 William Gladstone, on

becoming prime minister, gave Cardwell the War Office.

Concerned with improving conditions for the private soldier, Cardwell, in 1868, abolished flogging as a military punishment in peacetime. Two years later, he shortened the army enlistment term from 12 years' active service (it had been 21 years from 1815 to 1847) to six years' active duty and six years' reserve obligation, making possible for the first time in Great Britain a large, well-prepared reserve of reasonably young men. These and other measures so stimulated enlistments that the payment of "bounty money" (recruitment bonuses) was abolished in 1870.

In 1871, over the almost unanimous opposition of senior officers, Cardwell succeeded in abolishing the purchase of military commissions. That system had allowed generations of rich men and their sons to attain high ranks for which they were wholly unfitted and thereby had retarded the progress of competent career officers. On leaving office with Gladstone in 1874, Cardwell was created a viscount. The almost effortless British conquest of Egypt in 1882 is believed to have demonstrated the value of his reforms.

Cardwell died without surviving issue, and his peerage became extinct.

Čardžou (Turkmenistan): see Chardzhou.

CARE, in full COOPERATIVE FOR AMERICAN RELIEF EVERYWHERE, formerly COOPERATIVE FOR AMERICAN REMITTANCES TO EUROPE and COOPERATIVE FOR AMERICAN REMITTANCES EVERYWHERE, international aid and development organization that operates in some 35 countries worldwide.

CARE was formed in 1945 as an umbrella organization for a group of U.S. and Canadian associations working to help rebuild war-torn western Europe. Rather than disband after Europe had recovered, the organization extended its services to the less-developed countries of the world, and many western European countries formed their own branches of CARE.

Working through the host governments, with an emphasis on shared cost and self-help programs, CARE organizes a number of projects, including land management, soil conservation, food distribution, nutrition, and nutrition education. Since 1962, CARE's services also have included the Medical International Cooperation Organization (MEDICO; founded 1958), which gives health care workers training for service to remote rural areas.

Carême, Marie-Antoine, byname ANTONIN (b. June 8, 1784, Paris, France—d. Jan. 12, 1833, Paris), chef who served the royalty of Europe and wrote several classics of cuisine.

Antonin was born into a poor family. He began his career at age 15 as a kitchen helper in a Parisian restaurant but soon moved to employment in a fashionable pastry shop, or *pâtisserie*, frequented by Charles-Maurice de Talleyrand. Carême's elaborately sculptured confections reached the table of Napoleon himself. Carême thereafter became the chef of Talleyrand (12 years), of the prince regent (the future George IV) of Great Britain (2 years), and briefly, in succession, of Tsar Alexander I of Russia, the court of Vienna, the British embassy in Paris, the Prince of Württemberg, the Marquess of Londonderry, and the Princess Bagration. He then spent 7 years with the Baron de Rothschild at his Ferrières estate.

His cuisine was famous for its decorative and elaborate display, approaching the grandiose, fitting for the old society of Europe. His chief works include *Le Cuisinier parisien ou l'art de la cuisine française au XIX^e siècle* (1828; "The Parisian Cook, or the Art of French Cooking in the 19th Century"), *Le Pâtissier royal parisien* (1828; "The Royal Parisian Pastry-Chef"), *L'Art de la cuisine française au XIX^e siècle* (1833; "The Art of French Cooking in

the 19th Century"), *Le Pâtissier pittoresque* (1842; "The Pictresque Pastry-Chef"), and *Le Maître d'hôtel français, traité des menus à servir à Paris, à Saint-Petersbourg, à Londres, à Vienne* (1820; "The French Head Waiter: A Selection of Menus to Serve in Paris, Saint Petersburg, London, and Vienna").

Carew, Sir George: see Totnes, George Carew, Earl of.

Carew, Rod, byname of RODNEY CLINE CAREW (b. Oct. 1, 1945, Gatun, Panama), professional American League baseball player, who was one of the great hitters of the modern era.

Carew began playing baseball as a schoolboy in Gatun, Panama. He went with his mother to New York City in 1962 and played sandlot ball there. He batted left-handed and threw right-handed. From 1964 through 1967 he played on minor-league teams in the Minnesota Twins organization and joined the parent club in 1967, when his performance earned him the Rookie of the Year award. Carew played second base until 1976 and first base thereafter. He led his league in hitting seven times (1969, 1972-75, and 1977-78), his highest average being .388 in 1977; that same year he was named the Most Valuable Player in the American League. He also stole home seven times in 1969, a league record. In 1979 he was traded to the California Angels. With them he batted more than .300, as he had for his last 10 years with the Twins. He retired in 1986, with a lifetime batting average of .328. He became a national hero in Panama and retained Panamanian citizenship. Carew was also a serious amateur photographer.

Carew, Thomas (b. 1594/95, West Wickham, Kent, Eng.—d. March 22, 1639/40, London), English poet and first of the Cavalier song writers.

Educated at the University of Oxford and at the Middle Temple, London, Carew served as secretary at embassies in Venice, The Hague, and Paris. In 1630 Carew received a court appointment and became server at table to the king. The Earl of Clarendon considered him as "a person of pleasant and facetious wit" among a brilliant circle of friends that included the playwright Ben Jonson.

Carew's only masque, *Coelum Britannicum*, was performed by the king and his nobles in 1634 and published the same year. Music for it was composed by Henry Lawes, who, among others, set some of Carew's songs to music.

Carew's poems, circulated in manuscript, were amatory lyrics or occasional poems addressed to members of the court circle, notable for their ease of language and skillful control of mood and imagery. His longest poem was the sensuous *Rapture*. He was a meticulous workman, and his own verses addressed to Ben Jonson show that he was proud to share Jonson's creed of painstaking perfection. He admired the poems of John Donne, whom he called king of "the universal monarchy of wit" in his elegy on Donne (deemed the outstanding piece of poetic criticism of the age). Carew was also indebted to Italian poets, particularly Giambattista Marino, whose brilliant wit and technical facility were much akin to his own, and on whose work he based several of his lyrics. He translated a number of the Psalms and is said to have died with expressions of remorse for a life of libertinism.

His poems were published a few weeks after his death. The definitive edition is that of Rhodes Dunlap, *The Poems of Thomas Carew, with His Masque "Coelum Britannicum"* (1949).

Carey, George (Leonard) (b. Nov. 13, 1935, London, Eng.), archbishop of Canterbury from 1991 to 2002, theologian noted for his evangelical beliefs.

Carey left school at 15 and worked at the London Electricity Board before serving as a radio

operator in the Royal Air Force from 1954 to 1956. By 20 he had undergone a religious conversion, not Paul's experience on the road to Damascus, he admitted, but the simple conviction he had found something special. He was then admitted to King's College, London University, from which he received a bachelor of divinity degree in 1962. Beginning his clerical career as a curate in Islington (1962-66), Carey was also a lecturer at Oakhill College in Southgate (1966-70) and at St. John's College in Nottingham (1970-75). He was vicar of St. Nicholas' Church in Durham from 1975 to 1982 and principal of Trinity College, in Bristol (1982-87). In 1987 Carey was made bishop of Bath and Wells, and in 1990 he was named to succeed as archbishop of Canterbury.

As archbishop, Carey faced several controversial issues. Most notably, he supported the ordination of women in the church and declared that those opposed to it were heretics. The church also wrestled with the ordination and marriage of homosexuals, which Carey opposed. He spoke in support of the war in Afghanistan following the terrorist attacks on the United States in September 2001, but he called for a dialogue between Christians and Muslims. He announced his retirement in 2002, and Rowan Williams, archbishop of Wales, was appointed as his successor.

Carey wrote a number of books, including *I Believe in Man* (1975), *God Incarnate* (1976), *The Message of the Bible* (1988), and *The Archbishop of Canterbury's Millennium Message* (2000).

Carey, Henry (b. c. 1687, England—d. Oct. 4, 1743, London), English poet, playwright, and musician chiefly remembered for his ballads, especially "Sally in Our Alley," which appeared in a collection of his best poems set to music, called *The Musical Century* (1737). Despite the popularity of his work, Carey suffered great poverty, largely because his plays and poems were widely pirated by unscrupulous printers.

Until the 1930 edition of his poetry was published, Carey was reputed to be the illegitimate son of George Savile, 1st Marquess of Halifax; however, it is now suggested that he was Savile's illegitimate grandson. Carey arrived in London (perhaps from Yorkshire) sometime before 1713, when his first book of poems was published. He studied music and began to work for the theatre, often providing both words and music for a number of farces, burlesques, ballad operas, and interludes; of his theatre work, the best is perhaps *The Honest Yorkshire-Man* (1735). His commissions fell off after 1740. Heavily in debt, Carey committed suicide by hanging. His son later claimed that his father was the author of "God Save the Queen," but this claim is unproved.

Carey, Henry C(harles) (b. Dec. 15, 1793, Philadelphia, Pa., U.S.—d. Oct. 13, 1879, Philadelphia), American economist and sociologist, often called the founder of the American school of economics, widely known in his day as an advocate of protectionism.

The son of Mathew Carey, Irish-Catholic political refugee, writer, and publisher, Carey became a partner in Carey, Lea & Carey, a leading American publishing house, and later its president. His education, though informal, resulted in a cursory acquaintance with many fields of learning.

After 1835 he devoted himself to writing sociological and economic books and pamphlets. Among his more important works are *Essay on the Rate of Wages* (1835), *Principles of Political Economy* (1837-40), *Principles of Social Science* (1858-60), and *The Unity of Law* (1872). His works were translated into at least eight languages, many persons finding in them a foil to laissez-faire.

He became critical of English classical political economy. An optimist, he looked upon nature's laws as conducive to steady economic

progress and to the harmony of diverse economic interests. Also a Republican and a nationalist, Carey believed protection initially essential to the industrial development of rising nations. His home served as a salon, and his reputation was greater abroad than at home.

Carey, William (b. Aug. 17, 1761, Paulerspury, Northamptonshire, Eng.—d. June 9, 1834, Frederiksnagar [now Shrirāmpur], India), founder of the English Baptist Missionary Society (1792), missionary to India, and educator whose mission at Serampur set the pattern for modern missionary work. He has been called the "father of Bengali prose" for his grammars, dictionaries, and translations.

A Baptist from 1783, Carey served for several years as a pastor in Moulton, Northamptonshire, where he also taught school and continued his trade as a shoemaker. In 1789 he transferred to the Baptist church at Leicester and three years later published a pamphlet entitled *An Enquiry into the Obligations of Christians to Use Means for the Conversion of the Heathens*, which led to his formation, with a dozen other ministers, of the English Baptist Missionary Society.

William Carey, detail from an oil painting by Robert Home, 1812
By courtesy of Regent's Park College, Oxford

The new society's first missionaries, Carey and John Thomas, a doctor, went to Calcutta in 1793. The following year, Carey removed himself from the society's financial support when he became superintendent at an indigo plant at Mudnabati, Bengal. There he also preached, taught, and began his first Bible translation. Compelled to leave British-Indian territory, he and his family moved to the Danish colony of Frederiksnagar in 1800. There he and Joshua Marshman and William Ward, collectively known as the "Serampore trio," founded the mission described by the English philanthropist William Wilberforce as "one of the chief glories" of the British nation.

Appointed in 1801 to teach Bengali, Sanskrit, and Marathi at Fort William College, Carey translated the Bible into Bengali, Oriya, Marathi, Hindi, Assamese, and Sanskrit. Parts of it he also translated into 29 other languages and dialects. He edited, with Marshman, a grammar in Bhotia and prepared six other grammars in different languages. In addition to dictionaries in Bengali, Sanskrit, and Marathi, Carey and Marshman prepared a translation of three volumes of the Hindu epic poem *Rāmāyana*. Having established a press at Serampur, Carey edited and published two works of the horticulturist William Roxburgh, *Hortus Bengalensis* (1814) and *Flora Indica* (1832), and helped distribute prose texts for use in schools. His social work extended beyond education to urge the government to outlaw such practices as infanticide and suttee (in which Hindu widows immolated themselves on their husbands' funeral pyres). He also encouraged the use of Indians as missionaries and led in the formation of the Agricultural Society of India in 1820.

cargo cult, any of the religious movements chiefly, but not solely, in Melanesia that exhibit belief in the imminence of a new age of blessing, to be initiated by the arrival of a special "cargo" of goods from supernatural sources—based on the observation by local residents of the delivery of supplies to colonial officials. Tribal divinities, culture heroes, or ancestors may be expected to return with the cargo, or the goods may be expected to come through foreigners, who are sometimes accused of having intercepted material goods intended for the native peoples. If the cargo is expected by ship or plane, symbolic wharves or landing strips and warehouses are sometimes built in preparation, and traditional material resources are abandoned—gardening ceases, and pigs and foodstocks are destroyed. Former customs may be revived or current practices drastically changed, and new social organizations, sometimes imitative of the colonial police or armed forces, initiated.

These preparations announce the radically new age, thought to be inaugurated probably by cataclysmic events that will destroy the old order and bring a paradisaic plenty, together with freedom and justice that may involve the reversal of the positions of white foreigners and indigenous peoples. The political implications and economic losses connected with these mass movements led colonial authorities to repress them. They may, however, be understood as the expression of traditional millennial ideas, often revived by the eschatological teaching of Christian missions and further inspired by the material wealth of the whites, which was interpreted by nonliterate peoples as emanating from supernatural sources overseas.

Cargo cults led by prophets claiming a new revelation appeared in the late 19th century, caught public attention in the Papuan "Vailala Madness" in 1919, and proliferated from the 1930s, especially in marginal and undeveloped areas. In growing towns, cargo cults gave way to more secular movements.

Caria, ancient district of southwestern Anatolia. One of the most thoroughly Hellenized districts, its territory included Greek cities along its Aegean shore and a mountainous interior bounded by Lydia in the north and by Phrygia and Lycia in the east. The non-Greek Carians of the interior considered themselves an indigenous people and claimed kinship with the Lydians and Mysians, with whom they shared a common worship. Caria passed from Lydian to Persian rule about 546 BC. West Carian dynasts joined in the unsuccessful Ionian revolt against the Persian king Darius I (c. 499–493 BC), and the coastal cities were later drawn into the Greek Delian League. Early in the 4th century BC all of Caria was rejoined to Persia's Achaemenian Empire as a separate satrapy under the rule of the native Hecatomnid dynasty. One of the rulers, Mausolus (c. 377–353 BC), transferred the capital from Mylasa to Halicarnassus, where

his tomb came to rank as one of the Seven Wonders of the Ancient World. After Alexander the Great, the history of Caria is one of autonomous cities and communes under the suzerainty of a succession of Hellenistic rulers until the entire region was incorporated into the Roman province of Asia (129 BC).

Carian language, ancient language spoken in the southernmost area of western Anatolia. The language is known primarily from the more than 100 Carian graffiti that were left by Carian mercenaries who served in Egypt. Clay tablets and monumental inscriptions in the language have also been found in Caria since World War II. Carian appears to be written in an alphabetic script. Not enough is known of the language as yet for it to be definitely classified, although some scholars assume that it belongs to the Anatolian subgroup of the Indo-European language family.

Carib, American Indian people who inhabited the Lesser Antilles and parts of the neighbouring South American coast at the time of the Spanish conquest. Their name was given to the Caribbean Sea, and its Arawakan equivalent is the origin of the English word cannibal. Today the term Cariban is used to designate a linguistic group that includes the language of the Antillean Carib and many related languages spoken in South America.

Guianan Carib making a blowgun to be used for hunting

T. Bertranet—Atlas Photo

The Island Carib, who were warlike (and allegedly cannibalistic), were immigrants from the mainland who, after driving the Arawak (*q.v.*) from the Lesser Antilles, were expanding when the Spanish arrived. Peculiarly, the Carib language was spoken only by the men; women spoke Arawak. Raids upon other peoples provided women who were kept as slave-wives; the male captives were killed.

The Island Carib were a maritime people, expert navigators who made distant raids in large dugout canoes. Warfare was their major interest. Internal conflicts were common; there was no important chief, military organization, or hierarchical structure. The men strove to be individualistic warriors and boasted of their heroic exploits.

Carib groups of the South American mainland lived in the Guianas, and south to the Amazon River. Some were warlike and were alleged to have practiced cannibalism, but most were less aggressive than their Antillean relatives. They lived in small autonomous settlements, growing cassava and other crops and hunting with blowgun or bow and arrow. Their culture was typical of the peoples of the tropical forest. Other Carib-speaking tribes, apparently much like the Guianan Carib, were found to the west on the wooded slopes of the Andes along the Venezuelan-Colombian border. To the southeast the Guicuru, Bakairi, and other Carib speakers lived at the headwaters of the Xingu River in central Brazil.

Cariban languages, a group of South American Indian languages that were spoken before the Spanish conquest from what is now the Greater Antilles to the central Mato Grosso in Brazil; most of the languages, however, were spoken north of the Amazon River in what is now northern Brazil, the inland areas of the Guianas and Venezuela, and lowland Colombia. West Indian Cariban is extinct, and the languages of the group have undergone a drastic decline in the other areas.

Caribbean Community and Common Market (Caricom), organization of Caribbean nations and dependencies that was established in 1973 by the Treaty of Chaguaramas. It replaced the former Caribbean Free Trade Association (Carifta), which had become effective in 1968. Members include Antigua and Barbuda, The Bahamas (a member of the community but not the common market), Barbados, Belize, Dominica, Grenada, Guyana, Haiti, Jamaica, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, and Trinidad and Tobago. A number of other countries have observer or associate member status. The permanent secretariat has its headquarters in Georgetown, Guyana.

Caricom's main purposes are to promote economic integration and cooperation among its members and to coordinate foreign policy. In the late 1980s Caricom's heads of government declared their support for the creation of a regional common market, and in 1990 members agreed to develop common protectionist policies for trade with countries outside the organization, though many members were slow to implement these and other decisions. By the late 1990s, movement toward a single market had stalled.

Caribbean Current, powerful surface oceanic current passing west through the Caribbean Sea, then north through the Yucatán Channel, and finally east out the Straits of Florida to form the Florida Current. The warm Caribbean Current, derived from the junction of the North Equatorial Current and the Guiana Current, flows at an average rate in the range of 38 to 43 cm (15 to 17 inches) per second and transports about 27,500,000 cubic m (1,000,000,000 cubic feet) of water per second.

Caribbean literature, literary works of the Caribbean area written in Spanish, French, or English. The literature of the Caribbean has no indigenous tradition. The pre-Columbian American Indians left few rock carvings or inscriptions (petroglyphs), and their oral traditions did not survive 16th-century Spanish colonization. The West Africans who replaced them were also without a written tradition, so that for about 400 years Caribbean literature was an offshoot and imitation of the models of the colonial powers—Spain, France, Great Britain, and The Netherlands. Caribbean writers, however, were not unaware of their environment. The letters and speeches of Toussaint-Louverture, the Haitian general and liberator, indicate that from at least the end of the 18th century the Caribbean was conscious of its cultural identity. It was not until the 1920s, however, that the challenge of a distinctive literary form was accepted. Then, as part of Spanish-American Modernism, Spanish and French Caribbean writers began to break away from European models and to identify themselves with their fellow West Indians, most of whom were black.

The leaders of this movement, mainly poets, were Luis Palés Matos (Puerto Rico), Jacques Roumain (Haiti), Nicolás Guillén (Cuba), Léon Damas (French Guiana), and Aimé Césaire (Martinique). Jean Price-Mars, a Haitian ethnologist, in *Ainsi parla l'oncle* (1928; "Thus Spoke the Uncle"), declared that his purpose was to "restore to the Haitian people the dignity of their folklore." The achievement of

Caria under the Roman Empire

this Negritude, finely expressed in Césaire's poem *Cahier d'un retour au pays natal* (1939; *Return to My Native Land*), was the construction into poetic forms of the rhythmic and tonal elements of the islands' rituals and speech patterns, using Symbolist and Surrealist techniques.

The British Caribbean, developing its national literature after 1945, made its own contribution in the folk dialect novel: Vic Reid's *New Day* (1949), Samuel Selvon's *A Brighter Sun* (1952) and *The Lonely Londoners* (1956), George Lamming's *In the Castle of My Skin* (1953), and V.S. Naipaul's *Mystic Masseur* (1957) and *A House for Mr. Biswas* (1961), among others; and in the poetry of Louise Bennett (*Jamaica Labrish*, 1966). Paradoxically, anglophone Caribbean development was formally conservative, working toward an "open" rather than an autochthonous, or indigenous, expression in the work of C.L.R. James (Trinidad) and the poetry of Derek Walcott (St. Lucia). In the novels of Wilson Harris (Guyana), the Symbolist and Surrealist techniques of the Modernist movement reappear; and the poetry of Edward Brathwaite (*Rights of Passage* [1967], *Masks* [1968], *Islands* [1969]) attempts to reassert the place of Africa in the Caribbean. (E.Be.)

Caribbean Sea, suboceanic basin of the western Atlantic Ocean, situated north of the Equator in the Western Hemisphere and washing the northern coast of South America and the eastern coasts of Central America and part of Mexico. It covers an area of approximately 1,063,000 square miles (2,754,000 square km).

A brief treatment of the Caribbean Sea follows. For full treatment, see MACROPAEDIA: Atlantic Ocean.

To the south the Caribbean Sea is bounded by the coasts of Venezuela, Colombia, and Panama; to the west by Costa Rica, Nicaragua, Honduras, Guatemala, Belize, and the Yucatán Peninsula of Mexico; to the north by the Greater Antillean islands of Cuba, Hispaniola, Jamaica, and Puerto Rico; and to the east by the Lesser Antillean chain, composed of the island arc that extends from the Virgin Islands in the northeast to Trinidad, off the Venezuelan coast, in the southeast. The Yucatán Channel connects the sea with the Gulf of Mexico to the north. The Caribbean's greatest known depth is Cayman Trench (Bartlett Deep), located between Cuba and Jamaica, at approximately 25,216 feet (7,686 m) below sea level.

The Caribbean Sea is divided into five submarine basins that are roughly elliptical in shape and separated from one another by submerged ridges and rises. These are the Yucatán, Cayman, Colombian, Venezuelan, and Grenada basins. Subsurface water enters the Caribbean Sea across two sills. These sills are located below the Anegada Passage, which runs between the Virgin Islands and the Lesser Antilles, and the Windward Passage, which runs between Cuba and Hispaniola. The sill depth of the Anegada Passage is between 6,400 and 7,700 feet (1,950 and 2,350 m); the sill depth of the Windward Passage is from 5,250 to 5,350 feet (1,600 to 1,630 m).

The climate of the Caribbean is generally tropical, but there are great local variations, depending on neighbouring mountain elevations, water currents, and the trade winds. Rainfall varies from 350 inches (8,890 mm) a year in parts of Dominica to about 10 inches (254 mm) annually on the island of Bonaire, off the coast of Venezuela.

The geologic age of the Caribbean is not known with certainty. As part of the Central American Sea, it is presumed to have been connected with the Mediterranean Sea during Paleozoic times (from about 540 to 245 million years ago) and then gradually to have separated from it as the Atlantic was formed.

The economies of the Caribbean countries

are greatly dependent upon tourism. With its sunny climate and recreational resources, the region has become one of the world's principal winter vacation resort areas, particularly for the peoples of the United States and Canada to the north and Brazil and Argentina to the south.

Cariboo Mountains, range in eastern British Columbia, Canada, forming the northern subdivision of the Columbia Mountains. The

Helmcken Falls in Wells Gray Provincial Park, in the southern part of the Cariboo Mountains, British Columbia

Bob and Ira Spring

Cariboo Mountains lie within an area enclosed by the great bend of the Fraser River and its tributary, the North Thompson. The mountains extend for about 190 miles (305 km) and parallel the Rocky Mountain Trench, which separates them from the Canadian Rockies. From Mount Sir Wilfrid Laurier (11,549 feet [3,520 m]), the highest peak, the mountains gradually decline northward and westward, merging with the Interior Plateau near Prince George. They are well mineralized, and gold is mined near Barkerville, which was the centre of a gold rush in the 1860s. Wells Gray and Bowron Lake provincial parks occupy the western slopes, where there is some lumbering and ranching in addition to mining.

Cariboo Road, wagon trail that was constructed (1862–65) in the Fraser River valley, in southern British Columbia, Canada,

Wagon freighting on the Cariboo Road north of Yale, B.C., during the late 19th century

By courtesy of the Provincial Archives, Victoria, B.C.

to serve the Cariboo gold rush. The trail extended more than 400 miles (644 km) from Yale, at the head of steamboat navigation on the Fraser River, through Ashcroft, to Barkerville in the Cariboo Mountains. The project was regarded as an engineering triumph because of the precipitous terrain. The original road, which facilitated settlement of the area, has been replaced by a modern highway that is called Cariboo Highway along part of its extent.

Caribou, city, Aroostook county, northeastern Maine, U.S. It lies along the Aroostook River, near the New Brunswick border, 13 miles (21 km) north of Presque Isle. Settled in 1824, it developed as a lumbering centre and was incorporated in 1859 as Lyndon Village. It was renamed Caribou in 1877 for the woodland caribou once plentiful in the region. The city is the shipping point for a large potato-growing region. It serves as a gateway to Maine's Great North Woods and the Allagash outdoor recreation area. Caribou's Nylander Museum houses Indian artifacts, minerals, and geologic items collected by the Swedish-born naturalist and geologist Olaf Nylander. Inc. city, 1968. Pop. (1990) 9,415.

caribou, in North America, a native species of reindeer (*q.v.*).

caricature, in graphic art, comically distorted drawing or likeness, done with the purpose of satirizing or ridiculing its subject, whether it be a person, type, or action. Plentiful examples of comic distortion may be found in gargoyles, the marginal illuminations of manuscripts, medieval broadsheets, and elsewhere, but the first known portrait caricatures are from late 16th- or early 17th-century Italy. The Italian word *caricatura* (from *caricare*, "to load," or "to surcharge") is said to have been coined by the painter Annibale Carracci, who is also credited with inventing the device in its modern sense, put to virulent use by subsequent political caricaturists, of transforming a face into an animal, vegetable, or indeed anything, while retaining a likeness.

A brief treatment of caricature follows. For full treatment, see MACROPAEDIA: Caricature, Cartoon, and Comic Strip.

Political caricature appeared first in 18th-century England. Aristocratic English amateurs, having encountered the cunning likenesses done by Pier Leone Ghezzi in Rome, took them and the craze for caricature home. One of the most successful exponents of the fashionable new art form, George Townshend, extended its range of targets from personal acquaintances and artistic celebrities to politicians. Political caricature quickly achieved wide popularity; between 1780 and 1820, in a feverish political atmosphere, huge numbers of satirical prints were produced for sale or hire. In these political squibs, by now included in the widening term caricature, the tradition of "moral pictures" is as strong as that of Carracci and Townshend. Nevertheless, the 18th-century amateurs, whose insouciant draftsmanship often conveyed an unintentional humour, shaped the characteristic style of caricature. A similar lively crudeness of expression was deliberately cultivated by the following generation of professional caricaturists, and preeminent among them was James Gillray, whose manner of drawing nicely complemented the grossness of his subjects. Many familiar cartoon conventions were established at this time: captions, speech balloons, and, particularly in the prints of Mustard George, the division of the paper into frames to present a series of related or contrasted pictures

(though not a narrative)—the comic strip in embryo. Among the first artists to use these devices specifically for the purpose of narrating a comic story was the Swiss Rodolphe Töpffer, who published his *Adventures of Dr. Festus* as lithographs in 1829.

The invention of lithography in the late 18th century was quickly exploited in France as a means of publishing pictures. Caricature became connected with journalism. Two satirical periodicals in particular, the weekly *La Caricature* and the daily *La Charivari*, both founded by Charles Philipon in the 1830s, exerted a far-reaching influence through the thousands of masterly lithographs they published. The trend in caricature toward a rapid, expressive style was confirmed by the use of lithography, a fast and direct method in which the artist drew directly onto the stone from which the prints were taken. The relentless political campaigns of *La Charivari*, including that against King Louis-Philippe, which transformed his fat face into a pear (*poire*, "dullard"), resulted in its eventual muzzling by official censorship. The journal consequently turned to social satire and established the genre of the *portrait chargé*, or "loaded portrait," in which the subject is allegorized as well as caricatured. Philipon's journals, in both phases, had many imitators: political-satirical in continental Europe and the more purely comic, as in the increasingly respectable *Punch*, in England.

Punch, with its high standards of draughtsmanship and inoffensive caricatures, often no more than illustrated jokes, contrasted strongly with the political aggressiveness of its European counterparts and its own English predecessors. Popular art did not survive long after 1830 in the lower strata of English society, except in the ancient form of woodcut broadsheets. During most of the Victorian age, periodicals like *Punch*, in which the tradition of British caricature was carried on, were available at threepence or sixpence a copy for those who could afford them. In England it was the adoption of wood engraving, rather than lithography, to replace copperplate etching that brought caricature into periodicals such as *Punch* in the 1840s; and wood engraving, a medium in which the artist's original drawing is worked over by craftsmen, produced a more restrained and conventional style than that of continental lithographs, thus reflecting a similar contrast of national attitudes in the caricaturists' approaches.

It was *Punch* that caused the word cartoon to supplant the overworked designation caricature, by parodying, with great popular success, a series of genuine cartoons, or full-size sketches to be used as patterns, for the new House of Commons frescoes in 1843. The meaning of cartoon was then further stretched with the appearance, largely in the 1860s, of "serious" cartoons. Perhaps the most famous was Sir John Tenniel's "Dropping the Pilot" (1890, referring to the dismissal of Otto von Bismarck by Kaiser Wilhelm II of Germany). This sort used analogy, symbols, or allegorical figures, with no distortion or humorous intent, to comment on contemporary events.

The revolution in printing caused by photo-process engraving in the 1880s democratized caricature. The cheapness of the new process made it possible, and so commercially obligatory, to illustrate daily newspapers; in 1888 the *Pall Mall Gazette* employed the first staff cartoonist, F.C.G. (Francis Caruthers Gould). Cheap comic papers, combining photo-process engraving with simple forms of colour printing, proliferated and brought caricature within reach of all classes; in England the comic-strip weekly "Ally Sloper's Half Holiday," at a halfpenny a copy, became

"the poor man's *Punch*." American newspapers in the 1890s began to include comic strips as well as political cartoons; "The Katzenjammer Kids," a continuing story, appeared in 1897. Process engraving also brought about a relaxation of style; it faithfully reproduced the artist's drawing, whether in broad brushstrokes or, like Phil May's, in swift pen scribbles. Cartoonists began to take advantage of this to develop a line as individual as possible; Caran d'Ache, Albert Hirschfeld, David Low, Max Beerbohm, Jean Cocteau, Miguel Covarrubias, and Vicky became household words, each indicating not merely a cartoonist but a type of drawing. Simultaneously a number of painters—such as Henri Toulouse-Lautrec, James Abbott McNeill Whistler, Lyonel Feininger, George Grosz, Paul Klee, William Gropper, and Ben Shahn—advanced caricature in the fine arts.

As single-panel gag cartoons, comic strips, and comic books grew in popularity during the mid-20th century, caricature was not so much in evidence. A number of cartoonists, however, invigorated and gave new life to the medium—including England's Cecil Beaton, Gerard Hoffnung, Ronald Searle, and Gerald Scarfe and the United States' Robert Osborn, David Levine, Edward Sorel, and Patrick Bruce Oliphant.

INDEX
first

caries, plural **CARIES**, also called **TOOTH DECAY**, cavity or decay of a tooth, a localized disease that begins at the surface of the tooth and may progress through the dentine into the pulp cavity. It is believed that the action of microorganisms in the mouth on ingested sugars and carbohydrates produces acids that eat away the enamel. The protein structure of the dentine is then destroyed by enzymatic action.

Diet, general health, structural defects of the teeth, and heredity affect one's chances of developing caries. Treatment includes attention to diet, often entailing the avoidance of sweets, and care of the teeth by cleansing and by restoring teeth that have cavities. The addition of sodium fluoride to fluoride-deficient municipal water supplies has been observed to reduce the incidence of caries by as much as 65 percent.

carillon, musical instrument consisting of at least 23 cast bronze bells in fixed suspension, tuned in chromatic order (*i.e.*, in half steps) and capable of concordant harmony when sounded together. Customarily located in a tower, it is played from a clavier, or keyboard, containing wooden levers and pedals wired to

Carillon clavier
Gillett & Johnston (Croydon) Limited

clappers or, less commonly, from an ivory keyboard with electric action operating the clappers; but only the first method permits expression through variation of touch. On some instruments a part of the range is capable of automatic play by use of perforated rolls.

Most carillons encompass three to four octaves, a few five and even six. Although the bourdon, or lowest note, can be any pitch, it often sounds around middle C. In heavy instruments the bell to produce this note may weigh 6 to 8 tons, occasionally 10 or 12; the world's heaviest, at the Riverside Church, New York City, weighs 20 tons. Carillon bells diminish in size and weight with the upward scale to extreme trebles of about 20 pounds (9 kilograms). Playing large instruments—using fists and feet—takes considerable physical exertion, as clappers weighing as much as several hundred pounds must be swung. (The heaviest clappers are counterbalanced.)

Most carillon music has been arranged for a specific instrument by its player. Baroque music of the 17th and 18th centuries adapts to bells; much of Vivaldi, Couperin, Corelli, Handel, Bach, and Mozart is admirably suited to carillon transcription. Nineteenth-century Romantic music must be chosen selectively, and contemporary music even more so. Improvisation is extensively employed, particularly on folk songs and other familiar themes.

The word carillon was originally applied in France to four stationary clock bells (hence the medieval Latin name *quadrilionem*) and later referred to any group of fixed bells. During the 14th century a weight-driven revolving pegged drum was invented that could be connected to clockworks; the pegs tripped levers wired to hammers, which in turn struck the bells. For the next 150 years, clock chimes struck by this method produced simple note sequences or melodies preceding the hour strike in church and town-hall towers. Interest in the musical potential of bells was greatest in Belgium and the Netherlands, where bell founding had reached an advanced stage and a bell profile had been developed that produced a more musical sound than those of foreign founders. The set of bells now known as a carillon originated in Flanders, possibly at Aalst or Antwerp, in about 1480. The Flemish devised a wooden keyboard for use alongside the chiming cylinder. This innovation became popular throughout Belgium and the Netherlands and northern France but was widely adopted elsewhere only in modern times.

Carillon art reached a pinnacle in the latter half of the 17th century with the founders François and Pierre Hémony of the Netherlands. They were the first to tune the bells with precision, especially with regard to a bell's inner tuning (*i.e.*, of the partial tones that make up a bell's complex sound), and thus to put fully into practice the results of research completed 200 years earlier. During the 19th century, tuning techniques (but not the underlying theory) were forgotten as orders for bells slackened; the bells that were made were generally inferior, and carillons fell into disrepair. The rediscovery of the tuning process at the John Taylor and Company foundry in Loughborough, Leicestershire, Eng., in the 1890s initiated a revival of carillon art.

Mechelen, Belg., has been the focal point of the carillon since the 16th century, the first post of municipal carillonneur being established there in 1557, at St. Rombold's Cathedral. Its carillon remains the world's best known. Jef Denyn, who played there from 1881 to 1941, led in the restoration of the art, establishing in 1922 the first carillon school and a publishing enterprise. In the same year, the carillon was introduced to the United States, where later the world's two largest, each with 72 bells, were built for the Riverside Church in New York City and for Rockefeller Chapel at the University of Chicago.

carillon, electronic: see electronic carillon.

Carinthia (Austria): see Kärnten.

Carinus, in full MARCUS AURELIUS CARINUS (d. 285, on the Margus River, Moesia Superior [now Morava River, Serbia, Yugos.]), Roman emperor from AD 283 to 285.

With the title of Caesar, he was sent by his father, the emperor Carus, to the army of the Rhine in 282. On his father's death in the summer of 283, Carinus became emperor in the West, his brother Numerian becoming emperor in the East. After a campaign on the Rhine, Carinus returned to Rome where, in September 284, he celebrated games in honour of Carus' victories in Persia the year before.

Carinus, marble bust; in the Capitoline Museum, Rome

Alinari—Art Resource

Near Verona in the spring of 285, Carinus defeated Aurelius Julianus, the governor of Venetia, who had proclaimed himself emperor. Shortly afterward Carinus was killed by his own troops during a battle against Diocletian (who had succeeded Numerian as emperor in the East) on the banks of the Margus River.

Carisbrooke, locality, Medina district, on the Isle of Wight, England. It lies just southwest of Newport. The locality's chief landmark is a great castle on a steep hill that shows three main periods of building—Roman, Norman, and Elizabethan. The remnants of a 3rd-century-AD Roman fort became the site of a Norman castle in the late 11th century. Further walls were added over the centuries, and the castle was enclosed by an elaborate outer fortification in the 16th century. The English king Charles I was imprisoned in the castle in 1647–48 before his trial and execution.

Carissimi, Giacomo (baptized April 18, 1605, Marino, near Rome [Italy]—d. Jan. 12, 1674, Rome), one of the greatest Italian composers of the 17th century, chiefly notable for his oratorios and secular cantatas.

Following brief appointments at Tivoli and Assisi, Carissimi settled in Rome in the late 1620s as director of music at the Church of Sant'Apollinare and retained this post until he died. Although not an operatic composer, Carissimi helped to satisfy the Italians' enthusiasm for opera by making its pastoral or dramatic content available in the home and in the church through his numerous oratorios and cantatas. His 16 oratorios on Old Testament subjects were "substitute operas" that could be performed during Lent, when operas were forbidden. Those episodes in which the narrative is interrupted and the characters express emotions, as in opera, show Carissimi's basic interest and talents. In his cantatas he consolidated the pioneer work of Luigi Rossi, but in oratorio he was himself a pioneer.

Carissimi's works are marked by emotional balance and an ideal fusion of the lyrical and the dramatic, and when working on a

large scale his pronounced feeling for tonality prevents any tendency to diffuseness. His genius is well displayed in his oratorio *Jephtha*, lasting about 20 minutes, where both solo narrator and chorus act as commentators and the latter also take the roles of opposing groups in the story. George Frideric Handel expanded this basic scheme in his oratorios. Carissimi greatly influenced later music not only through his compositions but also through his numerous pupils. A renewed interest in the music of Carissimi has resulted in performances of some of his oratorios, including *The Judgment of Solomon*, *Baltazar*, and *Judicium Extremum*.

Carl (personal name): see under Charles, except as below.

Carl XVI Gustaf, in full CARL GUSTAF FOLKE HUBERTUS (b. April 30, 1946, Stockholm, Sweden), king of Sweden from 1973.

The only son of King Gustav VI Adolf's eldest son, Prince Gustav Adolf (who died in an air crash in 1947), Carl Gustaf became crown prince in 1950, when his grandfather acceded to the throne. He studied at military cadet schools, at the University of Uppsala, and in France and was commissioned as a naval officer in 1968. He married Silvia Sommerlath in 1976, three years after his accession.

Carl Gustaf's accession occurred when the role of the Swedish monarchy was being radically altered. Under the constitution prior to 1975, the king played a formal role in the administration of the country; for example, he presided over councils of state, signed government decisions, commanded the armed forces, and appointed someone to form a new government upon the resignation of the current administration. The new constitutional laws, enacted in 1973 and made effective on Jan. 1, 1975, relieved the king of all these duties, leaving him with a solely symbolic function.

Carl Hagenbeck Tierpark: see Hagenbeck Zoo.

Carleton, Guy: see Dorchester (of Dorchester), Guy Carleton, 1st Baron.

Carleton, Mount, highest point (2,680 feet [817 m]) in the Maritime Provinces (New Brunswick, Nova Scotia, and Prince Edward Island) of Canada, 70 miles (110 km) east of Edmundston, N.B., near Nictau and Nepisiguit lakes. Structurally it is a monadnock, or erosional remnant, rising above the 1,000-foot (305-metre) level of the surrounding highlands, which are an extension of the Appalachian region. The mountain, focus of a provincial park in Restigouche county, was named in 1899 after General Thomas Carleton, New Brunswick's first governor.

Carleton, William (b. Feb. 20, 1794, Prilisk, County Tyrone, Ire.—d. Jan. 30, 1869, Dublin), prolific writer who realistically portrayed the life of the rural Irish.

Born the youngest of 14 children on a small farm, Carleton learned to appreciate the Irish

William Carleton, detail of a portrait by John J. Slattery, c. 1855; in the National Gallery of Ireland, Dublin

By courtesy of the National Gallery of Ireland, Dublin

heritage from his father, a man well-versed in the rich folklore of the area. At first a village tutor, he published a two-volume collection of sketches, *Traits and Stories of the Irish Peasantry* (1830), which describes the Ireland of the 19th-century tenant farmer. The writings that followed—e.g., *Tales of Ireland* (1834) and *Fardorougha the Miser* (1839)—deal with such rural problems as the land question, secret patriotic societies, and the Irish potato famine of the 1840s. Although filled with local colour, his powerful stories had wide appeal and were translated into French, German, and Italian.

Carletonville, town, principal mining centre of the Far West Witwatersrand goldfields, Gauteng province, South Africa, west of Johannesburg. Carletonville was originally an unplanned settlement established between 1937 and 1957 as various companies developed their gold-mining claims. In 1959 it was officially designated a town, being named for Guy Carleton Jones, a local mining director. Carletonville's prosperity is heavily dependent on the continued production of gold. Uranium is often recovered as a by-product of gold production, and the town contains some light industrial development. Situated in a dolomite area, the environs of the town have suffered from sinkhole destruction.

By 1979 Western Deep Levels Ltd. operated the world's deepest gold mine (extending to 12,392 feet [3,777 m] below the Earth's surface) in the locality. Pop. (1996) 164,367.

Carlile, Richard (b. Dec. 8, 1790, Ashburton, Devonshire, Eng.—d. Feb. 10, 1843, London), Radical English journalist who was a notable champion of the freedom of the press.

Carlile, detail of an oil painting by an unknown artist; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Although convinced that the free propagation of ideas was more important than specific reforms, he was an early advocate of almost all the Radical causes of his time, including the abolition of monarchy, completely secular education, and the emancipation of women.

A shoemaker's son, Carlile became a journeyman tinsmith in London in 1813. Influenced by the humanitarian Thomas Paine's *Rights of Man* and dismayed by the economic depression of 1817, he began a new career as a salesman of two Radical weeklies, *The Black Dwarf* and (William) *Sherwin's Weekly Political Register*. After Sherwin gave him control of his printing press in 1817, Carlile published several radical and deistic writings, among them his own *Political Litany*. For publishing Paine's works he was tried in 1819, heavily fined, and sentenced to a three-year term of imprisonment, which was extended to six years for nonpayment of the fine.

He had become sole proprietor of Sherwin's weekly journal that same year (1819), and, changing its name to *The Republican*, he edited 12 volumes in prison. Curiously, the

government made no attempt to stop his editorial work in jail, though his wife and other persons who operated his printing shop were harassed by police and at times imprisoned.

Carlile was released from prison in 1825, and the government decided against further legal action. He then edited two more volumes of *The Republican* and two new weeklies, *The Gorgon* and *The Lion*. From 1829 to 1831 he led discussions in the London Rotunda, which became the centre of Radical and freethinking activities.

Carlini, Armando (b. Aug. 9, 1878, Naples—d. Sept. 30, 1959, Pisa), Italian philosopher whose Christian spiritualism synthesized contemporary theories espoused by Giovanni Gentile and Benedetto Croce about the nature of phenomena. Basing his theory on the dichotomy of God and worldliness, he defined existence as dependent upon self-awareness and the identification of an "exterior world."

Educated at the universities of Bologna and Athens, Carlini succeeded Gentile as professor of theoretical philosophy at the University of Pisa (1922–59). His major works include *La vita dello spirito* (1921; "The Life of the Spirit"), *La metafisica di Aristotele* (1928; "The Metaphysics of Aristotle"), *La religiosità dell'arte e della filosofia* (1934; "The Religiousness of Art and Philosophy"), and *Lineamenti di una concezione realistica dello spirito umano* (1942; "Outline of a Realistic Conception of the Human Spirit"). *Alla ricerca di me stesso* (1951; "On the Research of Myself") is his moving autobiography.

Carlino (Florentine painter): see Dolci, Carlo.

Carlinsville, city, seat (1829) of Macoupin county, west-central Illinois, U.S., about 40 miles (65 km) southwest of Springfield. The first settlement on the site, in an area known as Black Hawk hunting ground (frequented by Sauk, Fox, and Kickapoo Indians), was made about 1815. The community was later named for Governor Thomas Carlin. A notable feature is the "million-dollar" county courthouse (1870), an imposing domed limestone structure, the construction of which was attended by fraud and scandal. Agriculture, including corn (maize), soybeans, and livestock raising, is important to the local economy. Industrial activities include coal mining and the manufacture of concrete and computer software. Blackburn College—which, in 1913, under the leadership of William M. Hudson, became internationally known for its work program to reduce tuition costs and its student management—was established in 1837.

The first American Civil War regiment in Illinois was organized at Carlinsville, and three Union generals—John M. Palmer, Richard Rowett, and John I. Rinaker—lived there. A plaque on the Methodist church lawn commemorates a speech Abraham Lincoln made there in 1858 in the campaign against Stephen A. Douglas for the U.S. Senate. Inc. 1837. Pop. (2000) 5,685.

Carlisle, urban area and city (district), administrative county of Cumbria, historic county of Cumberland, England, on the Scottish border.

In the Roman period, a civilian settlement, Luguvalium (later Carlisle), grew up on the south bank of the Eden, opposite Petriana (later Stanwix), a fortified camp on the line of Hadrian's Wall. The town dominated the surrounding area and in 685 became part of the see of Lindisfarne. It was destroyed by Norse invaders about 875 and was restored when claimed from the Scots by the Norman-English king William I in 1092. He initiated the building of a castle and walls.

Carlisle's role as a fortress town dates from the reign of Henry I (1100–35). Its position

commanding the narrow lowland entry into England from the northwest gave it strategic importance. Augustinian canons built a church, and their prior was created the first bishop in 1133. The first charter was granted in 1158, and in 1353 the city was given the right to a "free guild and a free election of their mayors and bailiffs." During the English Civil Wars, the town was besieged from October 1644 until June 1645, when its Royalist defenders finally surrendered to Parliamentary forces.

Considerable growth of the cotton-textile industry occurred in the late 18th and 19th centuries, and the community has remained the principal centre of the northern English cotton industry outside Lancashire, specializing in calico printing. New growth followed the advent of the railways after the 1830s, and Carlisle has become a major railway centre. Principal industries, besides textiles, are food and confectionery and engineering.

The cathedral was originally the church of the Augustinian priory (founded 1093), but much of this building was destroyed by fire in 1292 and 1392. Only part of the Norman nave remains. The Decorated-style east window contains mid-14th-century glass, and the tower was added in 1401. Of the castle remains, the most important are the central Norman keep, the 14th-century main gate, and Queen Mary's Tower.

There are colleges of art and technology, and Tullie House (1689) houses the city's museum and art gallery. The racecourse is one of the oldest in England.

The rural area of the district has large stretches of unspoiled countryside, reaching a high point at Cold Fell (2,041 feet [622 m]), and includes the towns and villages of Brampton, Longtown, Dalston, and Wetheral. Area city, 402 square miles (1,040 square km). Pop. (1991 prelim.) city, 72,439; (1998 est.) district, 103,000.

Carlisle, borough (town), seat (1751) of Cumberland county, southern Pennsylvania, U.S., in the Cumberland Valley, 18 miles (29 km) southwest of Harrisburg. James Le Tort, a French-Swiss Indian trader, settled with an Indian tribe near the site about 1720. The town was named for Carlisle, Cumberland, Eng.

Carlisle was the setting for nearly continuous conflict with the Iroquois Confederacy. During the French and Indian War a provincial fort was built (1756) that became the base for many military expeditions. Carlisle continued its strategic importance during the American Revolution, when it became a munitions supply point. (Molly Pitcher, Revolutionary War heroine, and other colonial notables are buried in the Old Graveyard.) In 1794 Carlisle served as the staging area for federal troops during the Whiskey Rebellion. Carlisle was a major station on the Underground Railroad prior to the American Civil War. During the war it was briefly occupied (June 27–30, 1863) by Confederate troops who bombarded it (July 1) as they left for the Battle of Gettysburg.

Light manufacturing (carpets, shoes, electronic equipment, paper products, clothing, quartz crystals, manganese steel, glass, and rubber products) dominates its economy. Dickinson College was founded there as a grammar school on land donated by Thomas and John Penn in 1773, and Dickinson School of Law, now part of the Pennsylvania State University system, was founded there in 1834. Carlisle Barracks, seat of the U.S. Army War College, formerly housed the Carlisle Indian Industrial School (1879–1918), where Olympic champion Jim Thorpe began his athletic training. Pop. (2000) borough, 17,970; Harrisburg–Lebanon–Carlisle MSA, 629,401.

Carlisle, Charles Howard, 3rd earl of (b. 1674—d. May 1, 1738, Bath, Somerset, Eng.), chief minister of Great Britain from Dec. 30, 1701, to May 6, 1702, and from May 23 to Oct. 11, 1715.

The eldest son of Edward Howard, the 2nd earl (1646?–92), he was a member of Parliament from 1690 until he succeeded his father as earl in 1692. Throughout his life he held a variety of crown-appointed posts, most notably as first lord of the Treasury (then the chief, or "prime," ministry) under Queen Anne and King George I.

Carlisle, John G(riffin) (b. Sept. 5, 1835, Campbell Co., Ky., U.S.—d. July 31, 1910, New York City), lawyer, legislator, and government official. He served as speaker of the U.S. House of Representatives (1883–89) and secretary of the Treasury (1893–97).

Carlisle was admitted to the Kentucky bar in 1858 and practiced law in Covington before his election to a term in the state legislature (1859–61); he also served in the Kentucky state senate (1866–71) and as lieutenant governor (1871–75). Carlisle, a Democrat, was elected to the U.S. House of Representatives in 1876; he championed tariff reduction and rose to the post of speaker (1883). In 1890 he resigned from the House to fill an unexpired term in the Senate.

In 1893 Pres. Grover Cleveland appointed him secretary of the treasury. Carlisle's hard-money policy during the depression that followed the Panic of 1893 was extremely unpopular in the growing free-silver wing of the Democratic Party. In 1896 he abandoned the party's nominee for president, William Jennings Bryan, champion of the free-silver movement, to support John M. Palmer, candidate of the National Democratic Party (Gold Democrats). As a result of this switch of allegiance, Carlisle lost popular support in his native Kentucky; from 1897 he practiced law in New York City.

Carlisle, Lucy Hay, countess of, née PERCY (b. 1599—d. Nov. 5, 1660), intriguer and conspirator during the English Civil Wars, celebrated by many poets of the day, including Thomas Carew, William Cartwright, Robert Herrick, and Sir John Suckling.

The second daughter of Henry Percy, 9th earl of Northumberland, she married James Hay (the earl of Carlisle from 1622) and became a conspicuous figure at the court of Charles I. The King's adviser, the Earl of Strafford, valued highly her sincerity and services; but after his execution (1641), possibly in consequence of a revulsion of feeling at his abandonment by the court, she devoted herself to the interests of the Parliamentary leaders, to whom she communicated the King's most secret plans and counsels. Her greatest achievement was the timely disclosure to Lord Essex of the King's intended arrest of the five members of Parliament, which enabled them to escape. But she appears to have served both parties simultaneously, betraying communications on both sides, and doing considerable mischief in inflaming political animosities.

In 1647 she attached herself to the interests of the moderate Presbyterian party, which assembled at her house, and in the second Civil War she demonstrated great zeal and activity in the royal cause, pawned her pearl necklace for £1,500 in order to raise money for Lord Holland's troops, established communications with Prince Charles during his blockade of the River Thames, and made herself the intermediary between the scattered bands of Royalists and the Queen. In consequence, her arrest was ordered on March 21, 1649, and she was imprisoned in the Tower, whence she maintained a correspondence in cipher with Charles through her brother, Lord Percy, until Charles went to Scotland. According to a Royalist newsletter, while in the Tower she was threatened with the rack in order to extort information. She was released on bail on September 25, 1650, but she appears never to have regained her former influence in the Royalist counsels and died, soon after the Restoration, of apoplexy.

Carlisle Commission, also called PEACE COMMISSION OF 1778, during U.S. War of Independence, group of British negotiators sent in 1778, to effect a reconciliation with the 13 insurgent colonies by a belated offer of self-rule within the empire. Shocked by the British defeat at Saratoga (concluded Oct. 17, 1777) and fearful of French recognition of American independence, Prime Minister Lord North induced Parliament to repeal (February 1778) such offensive measures as the Tea Act and the Massachusetts Government Act and to establish a commission to seek a negotiated settlement with the Americans. Headed by Frederick Howard, 5th earl of Carlisle, the commissioners set out in April, although they knew that the Franco-American Alliance had already been formed. Meanwhile, withdrawal of the main British army from Philadelphia to New York further stiffened American resolve to accept nothing short of independence, which the commission was not authorized to grant. Despite persistent propaganda and bribery attempts, the commission was unable to plead its case successfully.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Carlism, Spanish CARLISMO, a Spanish political movement of traditionalist character, originating in the 1820s in the *apostólico* or extreme clerical party and mobilized in 1827 in the form of paramilitary Royalist Volunteers. This opposition to liberalism crystallized in the 1830s around the person of Don Carlos (see Carlos María Isidro de Borbón), younger brother of King Ferdinand VII, and afterward conde (count) de Molina. In claiming the right to succeed his brother, Don Carlos denied the validity of Charles IV's pragmatic sanction of 1789, then being used by Ferdinand to ensure the succession of his infant daughter Isabella (born on Oct. 10, 1830). Instead, the Carlists invoked the Salic Law, introduced into Spain by Philip V in 1713, which excluded females from the royal succession.

The disputed succession and its ideological overtones provoked the Carlist War of 1833–39. The Carlists, though defeated, thereafter upheld their cause despite the conservatism of the Isabelline monarchy and unsuccessful attempts to effect a dynastic reconciliation through a marriage between Isabella II (*q.v.*) and Don Carlos' heir, Don Carlos, conde de Montemolín. The Carlist claim passed to the latter upon the "abdication" of "King Charles V" in 1845. On the death of "King Charles VI" (Montemolín) in 1861, the leadership of the cause was assumed by his brother Don Juan; his alleged liberalism brought about his "abdication" in 1868 in favour of his son, Don Carlos, duque de Madrid, "King Charles VII," who then led the movement until his death in 1909. During the 19th century the Carlists frequently resorted to armed rebellion: a second Carlist War was unsuccessfully waged in the late 1840s, an abortive attempt made at a military coup d'état in 1860, and full-scale war resumed between 1872 and 1876 during the political upheavals following the deposition (1868) of Isabella II. Yet another defeat, and the restoration (1874) of Isabella's son Alfonso XII, brought decline to Carlism, until Spain's humiliation in the Spanish-American War stimulated new growth and a brief return to insurgency during the years 1900–02.

Since the 1880s the party's history has been characterized by a series of conflicts between those who argued for understandings with other Catholic parties that accept the framework of parliamentary liberalism (or with parties resisting the encroachment of centralized state power) and those for whom the tactical alliance implied a watering down of principle. The latter point of view found expression in

the creation (1918) by Juan Vázquez de Mella of the Traditionalist Party, which subsequently became the principal exponent of Carlism. It was merged in 1937 with the Falange by Gen. Francisco Franco, a party with which it had little in common.

The third Don Carlos, duque de Madrid, was succeeded as pretender in 1909 by his only son Don Jaime, duque de Madrid, on whose death without issue in 1931 the succession passed to his uncle Don Alfonso Carlos, duque de San Jaime. With Alfonso's death in Vienna on Sept. 29, 1936, the Carlist line became extinct. Alfonso, however, had nominated his successor, Francis Xavier of Bourbon-Parma (styled Charles IX by his adherents in Spain). By 1960, however, most Carlists had accepted the recognition given in 1958 by prominent members of their party to the son of King Alfonso XIII, Don Juan, conde de Barcelona, an outspoken critic of Franco, as rightful pretender to the throne. In July 1969, Franco named his close supporter Juan Carlos, prince of Asturias and son of Don Juan, his legal heir; on Franco's death in 1975 Juan Carlos became king.

Carlo (Italian personal name): see under Charles.

Carloforte, only town on the small Isola di San Pietro (area 20 sq mi [52 sq km]), just off the southwest coast of Sardinia, Italy. The island is administratively part of Cagliari province. The town was named after Charles Emmanuel III of Savoy, who resettled the island in 1738, after centuries of desertion, with Genoese fugitives from the North African island of Tabarka. It has an observatory, set up in 1899 by the International Geodetic Survey as one of the six special latitude observatories on the parallel 39°08' N. Steamers ply between Porto Vesme (on Sardinia) and the island of Sant'Antioco. The main industry is tunny fishing; salt extraction and manganese mining are also carried on. Pop. (1991) mun., 6,630.

Carloman, German KARLMANN, name of rulers grouped below by country or nation and indicated by the symbol ●.

BAVARIA/CARINTHIA

● **Carloman** (b. 828—d. March or September 880, Öttingen, Ger.), eldest son of Louis II the German and father of the emperor Arnulf. Carloman rebelled against his father in 861 and 863 but in 865 was entrusted by Louis with a share in his authority, being granted jurisdiction over Bavaria and Carinthia. After this he remained loyal to his father, even helping to suppress the rebellion of his two younger brothers (866) and taking part in a campaign against the Moravians (869). The latter by 874 were forced to admit Frankish supremacy. After the death of the emperor Louis II (875), a faction in northern Italy favoured Carloman as candidate for the imperial crown; but Pope John VIII preferred Charles II the Bald. When Louis the German died (876), Carloman succeeded him as king of some of the German territories. In undisputed control of Bavaria, he promptly crossed the Alps on the death of Charles the Bald (877) and was recognized as king in northern Italy. The Pope, however, still refused him the imperial crown. Falling ill, Carloman had to renounce his lands and titles to his brother Louis III the Younger. His illegitimate son Arnulf became emperor in 896.

FRANCE

● **Carloman** (d. Dec. 12, 884), second son of Louis II and king of France or the West Franks (882–884). On Louis II's death (879) Carloman was associated with his brother Louis III as king of the West Franks, but both, as the children of a first marriage that had been

unacceptable to their grandfather Charles the Bald, had difficulty in obtaining recognition. On Louis's death (882) Carloman became sole ruler. He died while hunting.

FRANKISH KINGDOMS

● **Carloman** (b. c. 715—d. Aug. 17, 754), Frankish prince, son of Charles Martel and brother of Pepin III the Short.

After inheriting Austrasia, Alemannia, Thuringia, and the suzerainty of Bavaria from his father, Carloman fought alone and with his brother to suppress external enemies and rebellious subjects. Concerned with reform of the church, he called on St. Boniface for help and in 742 summoned the first Frankish council in nearly 50 years; in 743 the Synod of Estinnes regulated the problem of church lands seized by Charles Martel and granted out to his vassals.

Carloman abandoned the secular life, becoming a monk first at Monte Soratte, later at Monte Cassino, in Italy.

● **Carloman** (b. 751—d. Dec. 4, 771, Samoussy, Fr.), the younger brother of Charlemagne, with whom, at the instance of their father, Pepin III the Short, he was anointed king of the Franks in 754 by Pope Stephen II (III) in the abbey of Saint-Denis. Carloman inherited the eastern part of Pepin's lands (768). He favoured alliance with the Lombards and married Gerberga, a daughter of their king, Desiderius. When Carloman died, Charlemagne annexed his territory and became sole ruler of the Frankish empire.

Carlos (Portuguese, Spanish personal name): see under Charles, except as below.

Carlos DE AUSTRIA, byname DON CARLOS (b. July 8, 1545, Valladolid, Spain—d. July 25, 1568, Madrid), prince of Asturias, son of King Philip II of Spain and Maria of Portugal, heir to the Spanish throne, whose hatred for his father led him to conspire with the King's enemies in the Low Countries, thus provoking his arrest. His death contributed to the black legend of Philip II.

Don Carlos spent his first years at Alcalá de Henares with his aunts, the infantas Doña María and Doña Juana. Except for a short period, the Prince did not see his father until he was 14 years of age. In 1554 Philip II entrusted his son's education to Honorato Juan, but the humanist accomplished very little. Don Carlos was sickly and soon showed signs of mental instability, being given to outbursts of violence. The Cortes of Castile recognized him as heir to the throne in 1560, but Philip subsequently decided he was incapable of ruling and barred him from succession to the throne. In 1565 Don Carlos attempted to escape to Flanders and, two years later, to Germany. Finally, Philip II ordered his arrest (January 1568) when he learned of the intrigues of the Prince with the Marquis of Berghes and the Baron of Montigny, nobles involved in the rebellion of the Low Countries. Don Carlos died in prison a few months later. Although his death occurred under mysterious circumstances, there is no evidence that he was executed by order of his father. The accounts that the Prince was subject to a judicial process or that his death was caused by his love for Queen Isabella of Valois, Philip's wife, or by his Protestant inclinations lack historical foundation. Don Carlos is probably best known as the hero of a tragedy by Schiller and of Verdi's opera *Don Carlo*.

Carlos, DON: see Carlos de Austria; Carlos Luis de Borbón; Carlos María de los Dolores de Borbón y Austria-Este; Carlos María Isidro de Borbón.

Carlos Luis DE BORBÓN, COUNT (conde) DE MONTEMOLÍN, byname **DON CARLOS** (b. Jan. 31, 1818, Madrid, Spain—d. Jan. 13, 1861, Trieste, Austrian Empire [now in Italy]), the second Carlist, or Bourbon traditionalist, Spanish pretender (as Charles VI) who twice attempted unsuccessfully to seize the throne and who by perpetuating the breach within the Bourbon royal family helped weaken support for the monarchy.

Montemolin, grandson of Charles IV (reigned 1788–1808), was given the Carlist mantle by his father, Don Carlos, Count de Molina, in 1845. In 1846–48 Montemolin's Carlist partisans fought a hopeless war in Catalonia against his Bourbon cousin Queen Isabella II. In 1860 he again tried to wrest the throne from Isabella but was unsuccessful. He was captured and signed an abject renunciation of his claims, which he repudiated once safely in exile. When he died childless shortly thereafter, Carlist leadership passed to his brother Don Juan.

Carlos María DE LOS DOLORES DE BORBÓN Y AUSTRIA-ESTE, DUKE (duque) DE MADRID, byname **DON CARLOS** (b. March 30, 1848, Laibach, Austrian Empire [now Ljubljana, Slovenia]—d. July 18, 1909, Varese, Italy), the fourth Carlist, or Bourbon traditionalist, pretender to the Spanish throne (as Charles VII) whose military incompetence and lack of leadership led to the final decline of the Carlist cause.

Don Carlos was the great-grandson of Charles IV (reigned 1788–1808) and the eldest son of the third Carlist pretender, Don Juan de Borbón, who abdicated on his behalf during the Revolution of 1868, which deposed Isabella II. Taking advantage of the resulting political instability, Don Carlos rallied his forces and provoked a bloody civil war, the Second Carlist War (1872–76). Although the Carlists scored some notable successes, their cause was doomed by the accession of Isabella's son Alfonso XII to the throne in 1874.

Don Carlos fled and became a wandering exile. He failed to exercise leadership to implement his claim either at the death of Alfonso (1885) or at the time of national discontent following defeat in the Spanish-American War (1898). At his death the Carlist party, divided by the development of regionalist parties and the advent of liberal Roman Catholicism, was disillusioned and fragmented.

Carlos María Isidro DE BORBÓN, COUNT (conde) DE MOLINA, byname **DON CARLOS** (b. March 29, 1788, Madrid, Spain—d. March 10, 1855, Trieste, Austrian Empire [now in Italy]), the first Carlist pretender to the Spanish throne (as Charles V) and the second surviving son of King Charles IV.

Don Carlos was imprisoned in Napoleonic France from 1808 to 1814 and led an uneventful life thereafter until he incurred the hostility of the Spanish radicals during the constitutional period (1820–23). Although pious and rigidly orthodox, he was unwilling to pay attention to the overtures of the *apostólicos* (extreme clericals) until his brother Ferdinand VII tried to make him recognize his daughter Isabella as heir to the throne. Don Carlos refused, maintaining that by the form of Salic law established by Philip V in 1713 (subsequent revocations of which he considered invalid) he was Ferdinand's rightful successor. Since the Spanish liberals supported Isabella's claim, Don Carlos became the candidate of the clericals, asserting that he represented the true traditions of the monarchy, the church, and regional liberties against the foreign innovations of liberal constitutionalism and centralization.

He went to Portugal in March 1833 to meet his brother-in-law Dom Miguel, the pretender

to the Portuguese throne, and, in consequence of the civil war there, was cut off from Spain when Ferdinand VII died in September 1833. Don Carlos could return to Spain, where his supporters proclaimed him king as Charles V, only via England, and it was not until July 1834 that he put himself at the head of his partisans in the Basque provinces. Tomás de Zumalacárregui, his commander in chief, was a general of genius, but Don Carlos' lack of judgment prevented any early solution to the first Carlist War. After Zumalacárregui's death (1835) and the Carlists' failure to take Bilbao, the initiative passed increasingly to the liberals. When, in August 1839, the Carlist general Rafael Maroto signed the Convention of Vergara, by which the liberals recognized Basque legal privileges, most of the fighting ceased and Don Carlos went into exile. He abdicated his pretensions in 1845, taking the title Count de Molina, in the vain hope that his son Carlos Luis de Borbón might heal the breach within the Bourbon family by marrying Isabella II.

Carlota, French in full **MARIE-CHARLOTTE-AMÉLIE-AUGUSTINE-VICTOIRE-CLÉMENTINE-LÉOPOLDINE** (b. June 7, 1840, Laeken, Belg.—d. Jan. 19, 1927, near Brussels), wife of the emperor Maximilian of Mexico.

The only daughter of Leopold I, king of the Belgians, and Princess Louise of Orléans, Carlota married at age 17 the archduke Maximilian, brother of the emperor Francis Joseph of Austria. They lived as the Austrian regents in Milan until 1859, when Austria lost control of Lombardy. In 1864 she accompanied Maximilian to Mexico to accept the Mexican crown offered him by Napoleon III of France. The ambitious Carlota welcomed her authority in Mexico, but she also became genuinely interested in Mexican history, art, and culture. When in 1866 Napoleon withdrew his troops

Carlota

By courtesy of the Library of Congress, Washington, D.C.

in the face of Mexican resistance and U.S. opposition, she sought assistance for her husband's regime in Paris and Vienna and finally in Rome from the pope. Upon the failure of her efforts, she suffered a profound emotional collapse and never went back to Mexico. After the Mexicans executed her husband the following year, she spent the rest of her life in seclusion in castles at Laeken, Belg., and near Trieste, Italy.

Carlow, Irish **CEATHARLACH** ("The Four Lakes"), county in the province of Leinster, Ireland. The second smallest Irish county, it is bounded by County Kildare (north), Counties Wicklow and Wexford (east), and Counties Kilkenny and Laoighis (west). The town of Carlow is the county seat. In the east are the granitic mountains of the Leinster Chain, which are crossed by the River Slaney and flanked to the west by the River Barrow valley; west of the valley is the ridge of Old Loughlin bog. The intensively cultivated county is particularly suited for barley; wheat and sugar beets are other major crops. The railway from Dublin to Kilkenny and Waterford crosses the county.

Ceatharlach formed part of the medieval lordship of Leinster. Historic relics in the county include megalithic tombs, Norman castles, and monastic settlements. Area 346 square miles (896 square km). Pop. (1991 prelim.) 40,946.

Carlow, Irish **CEATHARLACH**, urban district and county seat, County Carlow, Ireland, on the left bank of the River Barrow. An Anglo-Norman stronghold, the town received charters of incorporation in the 13th and 17th centuries. The keep (innermost citadel) of a 13th-century stronghold remains at the confluence of the Barrow and Burren rivers. Local industries include sugar-beet and flour processing and the manufacture of footwear and machinery. Pop. (1991 prelim.) 11,275.

Carlowitz, Treaty of, Carlowitz also spelled **KARLOWITZ** (Jan. 26, 1699), peace settlement that ended hostilities (1683–99) between the Ottoman Empire and the Holy League (Austria, Poland, Venice, and Russia) and transferred Transylvania and much of Hungary from Turkish control to Austrian. The treaty significantly diminished Turkish influence in east-central Europe and made Austria the dominant power there.

In the late summer of 1697, the Ottoman sultan Mustafa II led one last large expedition northward but was defeated decisively by Prince Eugene of Savoy at the Battle of Zenta (September 11). Thus defeated by the Austrians and threatened by the Russians, the sultan agreed to negotiate. A peace congress met in 1698 at the village of Carlowitz (spelling used in the treaty), or Karlowitz (modern Sremski Karlovci, Yugos.), near Belgrade for 72 days. For the first time the Turks agreed to negotiate with a coalition of European nations, to accept mediation by neutral powers, and to admit defeat. On Jan. 26, 1699, the Ottoman Empire signed peace treaties with Austria, Poland, and Venice. Austria received all of Hungary (except the Banat of Temesvár, bounded by the Tisza, Mureş, and Danube rivers), Transylvania, Croatia, and Slovenia; the Austro-Turkish treaty was to last for 25 years. Venice acquired the Peloponnese (which the Turks regained in 1715) and most of Dalmatia, including the harbour of Cattaro (Kotor). Poland returned its conquests in Moldavia but regained Podolia as well as part of Ukraine west of the Dnieper River, which the Turks had conquered in 1672. The Turks and the Russians concluded only a two-year armistice at Carlowitz; but in 1700 they signed the Treaty of Constantinople, which gave Azov to Russia (Azov was returned to the Turks in 1711 and restored to Russia only in 1783) and also allowed the tsar to establish a permanent diplomatic mission in Constantinople (now Istanbul).

Carlsbad (Czech Republic): *see* Karlovy Vary.

Carlsbad, city, San Diego county, southern California, U.S. It lies along the Pacific Ocean just south of Oceanside, in a winter vegetable-

Alt Carlsbad Hanse Museum, Carlsbad, Calif., at the site of Frazier's original well

Photophile/Glasheen Graphics

and flower-growing district. Settled in the 1870s, it was first called Frazier's Station but was renamed (1883) when its mineral waters were found to be similar to those of Carlsbad in Bohemia (now Karlovy Vary, Czech Republic). After the arrival (1885) of the Santa Fe Railway, the city with its fine beaches became a popular health resort and vacation destination. Inc. 1952. Pop. (2000) 78,247.

Carlsbad, city, seat (1889) of Eddy county, southeastern New Mexico, U.S. It lies on the right bank of the Pecos River. Founded in 1887 and first known as Eddy (for its founder Charles B. Eddy), it was renamed in 1899 for the European spa of Carlsbad (now Karlovy Vary, Czech Republic), because of nearby mineral-springs. The centre (since 1888) of a large irrigated district, the city is a shipping point for locally produced cotton, alfalfa, wool, petroleum, and livestock. Potash, discovered in 1926, is also mined in the vicinity. A branch of New Mexico State University is located in the city. Carlsbad is the gateway to Carlsbad Caverns National Park (19 miles [31 km] southwest), and Living Desert State Park is nearby. Inc. 1918. Pop. (2000) 25,625.

Carlsbad Caverns National Park, area of the Chihuahuan Desert in southeastern New Mexico, U.S., near the base of the Guadalupe Mountains. It was designated a national monument in 1923, a national park in 1930, and a UNESCO World Heritage site in 1995. Beneath the park, which has a surface area of 73 square miles (189 square km) and is a sanctuary for native plants and wildlife, are 86 individual caves.

Dripping acidic groundwater dissolved surrounding limestone to carve out the massive chambers and form enormous stalactites and stalagmites. In the 1880s settlers discovered the site and began mining its bat guano for fertilizer. Carlsbad Caverns' labyrinth of underground chambers includes one of the largest ever discovered. The total length of the rooms and passages is still unknown, but the explored part of the main cavern is more than 30 miles (48 km) long, of which 3 miles (5 km) are open to visitors. Of the three major levels, the deepest is 1,027 feet (313 m) belowground. At the 755-foot (230-metre) level is the Big Room, which measures about 2,000 feet (610 m) long and 1,100 feet (335 m) wide and has a ceiling that arches up to 255 feet (78 m). Within are the Giant Dome, a stalagmite 62 feet (19 m) tall; the Twin Domes, slightly smaller, superbly proportioned and fluted; and the so-called Bottomless Pit. In summer a colony of about one million bats inhabits Bat Cave. Lechuguilla Cave, where more than 80 miles (130 km) of passages have been surveyed, contains unique underwater formations.

Carlsbad Decrees, Carlsbad also spelled KARLSBAD, series of resolutions (*Beschlüsse*) issued by a conference of ministers from the major German states, meeting at the Bohemian spa of Carlsbad (now Karlovy Vary, Czech Republic) on Aug. 6–31, 1819.

The occasion of the meeting was the desire of the Austrian foreign minister Klemens, prince von Metternich, to take advantage of the consternation caused by recent revolutionary outrages—especially the murder of the dramatist August Kotzebue by Karl Sand, a member of a radical student organization—to persuade the German governments to combine for the suppression of liberal and nationalistic tendencies within their states. Among Metternich's proposals were the censorship of all periodical publications, the supervision of the faculties of schools and universities, and the establishment of an investigating commission to uncover conspiratorial organizations. Approved on Sept. 20, 1819, the repressive and reactionary Carlsbad Decrees were enforced with varying severity in the German states

over the next decade. Although they were temporarily successful in suppressing liberal political activities, they failed in the long run to stifle German nationalism or to curtail liberal developments in the states.

Carlsberg Ridge, submarine ridge of the Arabian Sea and the Indian Ocean. The ridge is a portion of the Mid-Indian Ridge and extends from near Rodrigues Island to the Gulf of Aden, trending basically northwest to southeast. The ridge separates the Arabian Sea to the northeast from the Somali Basin to the southwest. The mean depth of the Carlsberg Ridge is about 9,600 feet (3,300 m) below sea level, and it rises to a mean elevation of about 7,000 feet (2,100 m) above the seafloor. The ridge turns westward around the island of Socotra and eventually connects with the East African Rift System by way of the Gulf of Aden. The Carlsberg Ridge coincides with the belt of seismic activity in the Indian Ocean.

Carlson, Chester F. (b. Feb. 8, 1906, Seattle, Wash., U.S.—d. Sept. 19, 1968, New York, N.Y.), American physicist who was the inventor of xerography, an electrostatic dry-copying process that found applications ranging from office copying to reproducing out-of-print books.

By the age of 14 Carlson was supporting his invalid parents, yet he managed to earn a college degree from the California Institute of Technology, Pasadena, in 1930. After a short time spent with the Bell Telephone Company, he obtained a position with the patent department of P.R. Mallory Company, a New York electronics firm. Plagued by the difficulty of getting copies of patent drawings and specifications, Carlson began in 1934 to look for a quick, convenient way to copy line drawings and text. Since numerous large corporations were already working on photographic or chemical copying processes, he turned to electrostatics for a solution. Four years later he succeeded in making the first xerographic copy. Carlson obtained the first of many patents for the xerographic process in 1940 and for the next four years tried unsuccessfully to interest someone in developing and marketing his invention. More than 20 companies turned him down. Finally, in 1944, he persuaded Battelle Memorial Institute, Columbus, Ohio, a nonprofit industrial research organization, to undertake developmental work. In 1947 a small firm in Rochester, N.Y., the Haloid Company (later the Xerox Corporation), obtained the commercial rights to xerography, and 11 years later Xerox introduced its first office copier.

Carlson, Evans, in full EVANS FORDYCE CARLSON (b. Feb. 26, 1896, Sidney, N.Y., U.S.—d. May 27, 1947, Plymouth, Conn.), U.S. Marine officer during World War II who led guerrilla fighters (Carlson's Raiders) on daring military incursions in the Pacific area.

Carlson ran away from home to enlist in the U.S. Army at age 16. During World War I he was made a captain and served as assistant adjutant general on the staff of General John J. Pershing in France and Germany and in the army of occupation (1917–19). He returned to civilian life in 1920 but enlisted as a private in the Marines in 1922, being commissioned a second lieutenant the following year. Carlson first served in China from 1927 to 1929 and returned in 1937 to spend nearly two years as an observer of the Chinese armies, including nearly a year with guerrillas behind Japanese lines. Back in the United States, he wrote and lectured extensively on the peril of Japanese expansionism in Southeast Asia. He warned against sending such war materials as scrap steel to a potential enemy and described the Chinese potential for resisting Japanese attack.

In 1941 Carlson became commander of the 2nd Marine Raider Battalion and, using his experience in China to train the group, led it in a surprise attack on Makin Island in the

Gilberts (August 1942) as well as in a month-long raid beyond Japanese lines on Guadalcanal (November). His leadership was characterized by extraordinary personal courage and endurance and unusual democratic discussion within the ranks. The morale of his men was among the highest in the armed forces; to friends he referred to his group as the Kung-Ho ("Work Together"), or Gung-Ho, Battalion. Malaria and wounds forced his retirement from active service in 1946, at which time he held the rank of brigadier general.

Carlsson, Arvid (b. Jan. 25, 1923, Uppsala, Sweden), Swedish pharmacologist who, along with Paul Greengard and Eric Kandel, was awarded the 2000 Nobel Prize for Physiology or Medicine for his research establishing dopamine as an important neurotransmitter in the brain.

Carlsson received his medical degree from the University of Lund in 1951 and subsequently held teaching positions there until 1959, when he became professor of pharmacology at Göteborg University. When Carlsson began his pioneering studies in the late 1950s, scientists thought that dopamine worked only indirectly, by causing brain cells to make another neurotransmitter, noradrenaline. Using a sensitive test that he had devised, Carlsson detected particularly high levels of the compound in areas of the brain that controlled walking and other voluntary movements. In animal experiments he showed that depletion of dopamine impairs the ability to move. When Carlsson treated dopamine-depleted animals with l-dopa, which the brain uses to make dopamine, the symptoms disappeared, and the animals moved normally again. This led to the use of l-dopa as a treatment for Parkinson disease, and it eventually becoming the single most important medication for the disease. Carlsson's work also contributed to an understanding of the relationship between neurotransmitters and mental states and led to the introduction of new antidepressant drugs.

Carlton, Steve, byname of STEVEN NORMAN CARLTON (b. Dec. 22, 1944, Miami, Fla., U.S.), professional National League left-handed baseball pitcher who in 1983 became the second pitcher to surpass Walter Johnson's career record of 3,508 strikeouts (Nolan Ryan was the first).

Carlton pitched for Miami-Dade (Fla.) Junior College before he signed a contract with the St. Louis Cardinals in 1965. After pitching on their minor-league clubs, he was called up in 1966 and remained with the Cardinals until he was traded to the Philadelphia Phillies after the 1971 season. He came into his own with the Phillies, winning 20 or more games six times (1971–72, 1976–77, 1980, and 1982). He won his 300th game on Sept. 23, 1983, becoming the 16th pitcher to do so. In 1972, 1977, 1980, and 1982 he won the Cy Young award for the best pitcher in the National League. He threw his 4,000th strikeout (while with the San Francisco Giants) in 1986 and two years later retired. His best pitches were a fastball and a hard slider that both broke and dropped. Carlton was inducted into the Baseball Hall of Fame in 1994.

Carlyle, Thomas (b. Dec. 4, 1795, Ecclefechan, Dumfriesshire, Scot.—d. Feb. 5, 1881, London, Eng.), British historian and essayist, whose major works include *The French Revolution*, 3 vol. (1837), *On Heroes, Hero-Worship, and the Heroic in History* (1841), and *The History of Friedrich II of Prussia, Called Frederick the Great*, 6 vol. (1858–65).

Early life. Carlyle was the second son of James Carlyle, the eldest child of his second marriage. James Carlyle was a mason by trade and, later, a small farmer, a man of profound Calvinist convictions whose character and way

of life had a profound and lasting influence on his son. Carlyle was equally devoted to his mother as well as to his eight brothers and sisters, and his strong affection for his family never diminished.

Carlyle, detail of an oil painting by G.F. Watts, 1877; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

After attending the village school at Ecclefechan, Thomas was sent in 1805 to Annan Academy, where he apparently suffered from bullying, and later to the University of Edinburgh (1809), where he read widely but followed no precise line of study. His father had intended him to enter the ministry, but Thomas became increasingly doubtful of his vocation. He had an aptitude for mathematics, and in 1814 he obtained a mathematical teaching post at Annan. In 1816 he went to another school, at Kirkcaldy, where the Scottish preacher and mystic Edward Irving was teaching. He became one of the few men to whom Carlyle gave complete admiration and affection. "But for Irving," Carlyle commented sometime later, "I had never known what communion of man with man means." Their friendship continued even after Irving moved in 1822 to London, where he became famous as a preacher.

The next years were hard for Carlyle. Teaching did not suit him and he abandoned it. In December 1819 he returned to Edinburgh University to study law, and there he spent three miserable years, lonely, unable to feel certain of any meaning in life, and eventually abandoning the idea of entering the ministry. He did a little coaching (tutoring) and journalism, was poor and isolated, and was conscious of intense spiritual struggles. About 1821 he experienced a kind of conversion, which he described some years later in fictionalized account in *Sartor Resartus*, whose salient feature was that it was negative—hatred of the devil, not love of God, being the dominating idea. Though it may be doubted whether everything was really experienced as he described it, this violence is certainly characteristic of Carlyle's tortured and defiant spirit. In those lean years he began his serious study of German, which always remained the literature he most admired and enjoyed. For Goethe, especially, he had the greatest reverence, and he published a translation, *Wilhelm Meister's Apprenticeship*, in 1824. Meanwhile, he led a nomadic life, holding several brief tutorships at Edinburgh, Dunkeld, and elsewhere.

Marriage. On Oct. 17, 1826, Carlyle married Jane Welsh, an intelligent, attractive, and somewhat temperamental daughter of a well-to-do doctor in Haddington. Welsh had been one of Irving's pupils, and she and Carlyle had known one another for five years. The hesitations and financial worries that beset them are

recorded in their letters. It is interesting that Carlyle, usually so imperious, often adopted a weak, pleading tone to his future wife during the time of courtship, though this did not prevent him from being a masterful, difficult, and irritable husband; and, in spite of their strong mutual affection, their marriage was full of quarrels and misunderstandings. Those who knew him best believed Carlyle to be impotent.

In the early years of their marriage the Carlyles lived mostly at Craigenputtock, Dumfriesshire, and Carlyle contributed to the *Edinburgh Review* and worked on *Sartor Resartus*. Though this book eventually achieved great popular success, he had at first much difficulty in finding a publisher for it. Written with mingled bitterness and humour, it is a fantastic hodgepodge of autobiography and German philosophy. Its main theme is that the intellectual forms in which men's deepest convictions have been cast are dead and that new ones must be found to fit the time but that the intellectual content of this new religious system is elusive. Its author speaks of "embodying the Divine Spirit of religion in a new Mythus, in a new vehicle and vesture," but he never says very clearly what the new vesture is to be.

London. In 1834, after failing to obtain several posts he had desired, Carlyle moved to London with his wife and settled in Cheyne Row. Though he had not earned anything by his writings for more than a year and was fearful of the day when his savings would be exhausted, he refused to compromise but began an ambitious historical work, *The French Revolution*. The story of how the partially completed manuscript was lent to J.S. Mill and accidentally burned is well known. After the accident Carlyle wrote to Mill in a generous, almost gay, tone, which is truly remarkable when Carlyle's ambition, his complete dependence upon a successful literary career, his poverty, the months of wasted work, and his habitual melancholy and irritability are considered. The truth seems to be that he could bear grand and terrible trials more easily than petty annoyances. His habitual, frustrated melancholy arose, in part, from the fact that his misfortunes were not serious enough to match his tragic view of life; and he sought relief in intensive historical research, choosing subjects in which divine drama, lacking in his own life, seemed most evident. His book on the French Revolution is perhaps his greatest achievement. After the loss of the manuscript he worked furiously at rewriting it. It was finished early in 1837 and soon won both serious acclaim and popular success, besides bringing him many invitations to lecture, thus solving his financial difficulties.

True to his idea of history as a "Divine Scripture," Carlyle saw the French Revolution as an inevitable judgment upon the folly and selfishness of the monarchy and nobility. This simple idea was backed with an immense mass of well-documented detail and, at times, a memorable skill in sketching character. The following extract is characteristic of the contorted, fiery, and doom-laden prose, which is alternately colloquial, humorous, and grim:

... an august Assembly spread its pavilion; curtained by the dark infinite of discords; founded on the wavering bottomless of the Abyss; and keeps continual hubbub. Time is around it, and Eternity, and the Inane; and it does what it can, what is given it to do (part 2, book 3, ch. 3).

Though many readers were thrilled by the drama of the narrative, it is not surprising that they were puzzled by Carlyle's prophetic harangues and their relevance to the contemporary situation.

In *Chartism* (1840) he appeared as a bitter opponent of conventional economic theory, but the radical-progressive and the reactionary

elements were curiously blurred and mingled. With the publication of *On Heroes, Hero-Worship, and the Heroic in History* (1841) his reverence for strength, particularly when combined with the conviction of a God-given mission, began to emerge. He discussed the hero as divinity (pagan myths), as prophet (Muhammad), as poet (Dante and Shakespeare), as priest (Luther and Knox), as man of letters (Johnson and Burns), and as king (Cromwell and Napoleon). It is perhaps in his treatment of poets that Carlyle shows to the best advantage. Perverse though he could be, he was never at the mercy of fashion; and he saw much more, particularly in Dante, than others did. Two years later this idea of the hero was elaborated in *Past and Present*, which strove "to penetrate . . . into a somewhat remote century . . . in hope of perhaps illustrating our own poor century thereby." He contrasts the wise and strong rule of a medieval abbot with the muddled softness and chaos of the 19th century, pronouncing in favour of the former, in spite of the fact that he had rejected dogmatic Christianity and had a special aversion to the Roman Catholic Church.

It was natural that Carlyle should turn to Cromwell as the greatest English example of his ideal man and should produce the bulky *Oliver Cromwell's Letters and Speeches. With Elucidations* in 1845. His next important work was *Latter-Day Pamphlets* (1850), in which the savage side of his nature was particularly prominent. In the essay on model prisons, for instance, he tried to persuade the public that the most brutal and useless sections of the population were being coddled in the new prisons of the 19th century. Though incapable of lying, Carlyle was completely unreliable as an observer, since he invariably saw what he had decided in advance that he ought to see.

In 1857 he embarked on a massive study of another of his heroes, Frederick the Great, and *The History of Friedrich II of Prussia, Called Frederick the Great* appeared between 1858 and 1865. Something of his political attitude at this time can be gathered from a letter written in April 1855 to the exiled Russian revolutionary A.I. Herzen, in which he says "I never had, and have now (if it were possible) less than ever, the least hope in 'Universal Suffrage' under any of its modifications" and refers to "the sheer Anarchy (as I reckon it sadly to be) which is got by 'Parliamentary eloquence,' Free Press, and counting of heads" (quoted from E.H. Carr, *The Romantic Exiles*).

Unfortunately, Carlyle was never able to respect ordinary men. Here, perhaps, rather than in any historical doubts about the veracity of the gospels, was the core of his quarrel with Christianity—it set too much value on the weak and sinful. His fierceness of spirit was composed of two elements, a serious Calvinistic desire to denounce evil and a habitual nervous ill temper, for which he often reproached himself but which he never managed to defeat.

Last years. In 1865 he was offered the rectorship of Edinburgh University. The speech that he delivered at his installation in April 1866 was not very remarkable in itself but its tone of high moral exhortation made it an immediate success. It was published in 1866 under the title *On the Choice of Books*. Soon after his triumph in Edinburgh, Jane Carlyle died suddenly in London. She was buried in Haddington, and an epitaph by her husband was placed in the church. Carlyle never completely recovered from her death. He lived another 15 years, weary, bored, and a partial recluse. A few public causes gained his support: he was active in the defense of Gov. E.J. Eyre of Jamaica, who was dismissed for his severity in putting down a Negro uprising in 1865. Carlyle commended him for "saving

the West Indies and hanging one incendiary mulatto, well worth gallows, if I can judge." He was excited by the Franco-German War (1870-71), saying "Germany ought to be President of Europe," but such enthusiastic moments soon faded. In these last years he wrote little. His history *The Early Kings of Norway: Also an Essay on the Portraits of John Knox* came out in 1875, and *Reminiscences* was published in 1881. Later he edited his wife's letters, which appeared in 1883 under the title *Letters and Memorials of Jane Welsh Carlyle, Prepared for Publication by Thomas Carlyle*. Although Westminster Abbey was offered for his burial, he was buried, according to his wish, beside his parents at Ecclefechan.

(A.O.J.C.)

BIBLIOGRAPHY. Two books by James Anthony Froude, *Thomas Carlyle: A History of the First Forty Years of Life, 1795-1835*, 2 vol. in 1 (1882, reissued in 2 vol., 1970), and *Thomas Carlyle: A History of His Life in London, 1834-1881*, 2 vol. in 1 (1884, reissued in 2 vol., 1969), together are not only the best life of Carlyle but are among the greatest of English biographies, combining the attitude of an intelligent disciple with penetrating observation and remorseless moral criticism. John Clubbe (ed.), *Froude's Life of Carlyle* (1979), an abridgment of Froude's 4-vol. work, essentially removes the primary material—i.e., Carlyle's letters. Froude also wrote *My Relations with Carlyle* (1903, reprinted 1971), his private account of the writing of the biography, in which he voiced his suspicions that sexual impotence may have been responsible for troubles in Carlyle's marriage. Modern biographies include Ian Campbell, *Thomas Carlyle* (1974); and Fred Kaplan, *Thomas Carlyle* (1983). A listing of Carlyle's works may be found in the extensive work by Isaac Watson Dyer, *A Bibliography of Thomas Carlyle's Writings and Ana* (1928, reprinted 1968).

Basil Willey, *Nineteenth Century Studies* (1949), places Carlyle judiciously in relation to Samuel Taylor Coleridge, Matthew Arnold, and other leading thinkers. John Holloway, *The Victorian Sage: Studies in Argument* (1953, reissued 1965), provides an admirable account of the philosophical and rhetorical aspects of Carlyle's persuasive methods. Philip Rosenberg, *The Seventh Hero: Thomas Carlyle and the Theory of Radical Activism* (1974), studies Carlyle and political theory. K.J. Fielding and Rodger L. Tarr (eds.), *Carlyle Past and Present* (1976), collects essays on various topics. Charles Richard Sanders, *Carlyle's Friendships and Other Studies* (1977), throws light on Carlyle's personal relationships. Kenneth Marc Harris, *Carlyle and Emerson: Their Long Debate* (1978), is the first study of the two writers. Rodger L. Tarr, *Thomas Carlyle: A Descriptive Bibliography* (1989), surveys the critical field.

carmagnole, originally, a Piedmontese peasant costume, (from Carmagnola, a town in Italy) that was well known in the south of France and brought to Paris by the revolutionaries of Marseille in 1792. The costume, later the popular dress of the Jacobins, consisted of a short-skirted coat with rows of metal buttons, a tricoloured waistcoat, and red cap. The name *carmagnole* was also applied to a famous Revolutionary song widely sung during the Reign of Terror.

Carman, (William) Bliss (b. April 15, 1861, Fredericton, N.B. [now in Canada]—d. June 8, 1929, New Canaan, Conn., U.S.), Canadian regional poet of the Maritime Provinces and the New England region of the United States who is remembered chiefly for poignant love poems and one or two rhapsodies in celebration of nature.

Educated at Fredericton Collegiate and at the University of New Brunswick, in Fredericton, Carman also attended lectures at the universities of Oxford and Edinburgh and at Harvard.

In 1890 he went to New York City and for two decades earned a living doing editorial work on various journals. Between 1893 and 1905 he published nearly 20 volumes of verse, including *Low Tide on Grand Pré* (1893); three series of *Songs from Vagabondia* (1894, 1896,

Carman

By courtesy of the Harriet Irving Library, University of New Brunswick, Fredericton

1901), written in collaboration with Richard Hovey, a poet whom he had met at Harvard; and *Sappho* (1904), improvisations based on the Greek fragments of Sappho. He also wrote several prose works on nature, art, and the human personality.

Carmarthen, former district (1974-96) of the former county of Dyfed, Wales. The region is now part of Carmarthenshire county.

Carmarthen, Welsh CAERFYRDDIN, town, administrative centre of the historic and present county of Carmarthenshire (Sir Gaerfyrddin), Wales. The town of Carmarthen is located on the River Tywi 8 miles (13 km) above its Bristol Channel mouth. Recognizing the site's strategic importance, both Romans and Normans built strongholds at Carmarthen, which commands a major river crossing on the coastal route across South Wales at the point where the Tywi valley offers an easy penetration northward into central Wales. During the medieval period Carmarthen became one of the most important boroughs in Wales, receiving many charters, notably from Henry III in 1227. In 1353 Edward III made the town the sole wool staple (market) for Wales. It had an Augustinian priory, dating from the Norman period, which housed the oldest extant Welsh manuscript, the *Black Book of Carmarthen* (c. 1170-1230). A market centre for a prosperous agricultural hinterland, Carmarthen was also a busy river port. After 1747 some iron smelting was carried on in the town, to which was added tinplate manufacture until 1900. Although some industry—notably milk processing—exists today, Carmarthen is largely an agricultural market town and a busy shopping centre. Its guildhall was built about 1770 on the site of an earlier one dating from 1583, and St. Peter's Church is largely of 14th-century construction. Associated with the town have been the Welsh national heroes Llywelyn the Great (Llywelyn ap Iorwerth) and Owen Glendower (Owain Glyndwr); the writer Sir Richard Steele (buried in St. Peter's Church); and the Georgian architect John Nash. Pop. (1991) 13,524.

Carmarthen, Thomas Osborne, Marquess of: see Leeds, Thomas Osborne, 1st Duke of.

Carmarthenshire, also called CARMARTHEN, Welsh SIR GAERFYRDDIN, county of southwestern Wales, extending inland from the Bristol Channel. The present county is coterminous with the historic county of the same name. It rises from sea level along the coast to an elevation of more than 2,000 feet (600 m) at Black Mountain in the east.

On the hills above 600 feet (180 m), there are Stone Age tumuli and cairns and, especially in the northwest, various stone monuments. Roman hilltop camps stood on spurs of the high ground. During the post-Roman centuries the Celtic saints reflected the Christian faith of the county, which suffered numerous raids by the Irish and the Scandinavians. The

strong reign of Rhodri Mawr (c. 870) brought a measure of peace, and his grandson Howel the Good (Hywel Dda) was the first to codify the ancient laws of Wales. After 1080 the Normans entered the area, built castles along the coast, and gradually penetrated the valleys to Carmarthen and Llandeilo. The campaigns of the English king Edward I gave the Normans a more unified control of the principality, and the Statutes of Rhuddlan (1284) created the county of Carmarthenshire. In 1536, under Henry VIII, the county was enlarged. The hill country, an area ideal for sheep raising, made Carmarthenshire famous for its wool in the later Middle Ages.

The town of Llandovery was strategically important in Roman times, and the nearby Church of Llanfair (restored 1915) was built within the ramparts of a Roman fort. The ruins of the 13th-century Dynevor Castle are located just west of Llandeilo. Originally built in 876 by Rhodri Mawr, the castle was taken by the English in the 13th century and rebuilt. The Welsh leader Owen Glendower tried to retake it in 1408 but failed. Kidwelly, established in 1115, is one of the oldest boroughs in Wales. Its castle was built by Roger of Salisbury in 1106 as one of a network of Norman strongholds across South Wales.

In the 17th century, during the English Civil Wars, the castles, especially the southern ones, offered half-hearted resistance to the Parliamentarian forces. Griffith Jones (1683-1761), vicar of Llanddowror, founded circulating schools, which effectively began the modern educational movement in Wales. The county was a site of the Rebecca Riots (1843), which erupted in response to increased tolls and tithes and discrimination against the poor. More recent noteworthy residents include the poet Dylan Thomas (1914-53), who lived at Laugharne and is buried there, and Gwynfor Evans, who became the first Welsh nationalist to sit in the House of Commons when he was elected to represent Carmarthen in 1966.

In the southeast, anthracite coal mining during the 19th and early 20th centuries promoted the growth of many mining villages and industrial towns, including Llanelli and Ammanford. After World War II new industries in the southeast replaced heavy industry and coal mining, which had ceased by the end of the 20th century. Today Llanelli produces tinplate for packaging and fabricated steel products, and the town has other light manufactures.

Outside the southeast, the county is mostly rural. Dairy farming is the main agricultural activity, and mixed farming and sheep raising take place in the northern hills. Both Llandovery and Llandeilo are agricultural market towns, as is Carmarthen town. Carmarthen is also the administrative centre and the historic county town (seat) of Carmarthenshire. The coastal town of Burry Port is a yachting centre. The eastern part of the county includes a section of Brecon Beacons National Park. Area 923 square miles (2,390 square km). Pop. (1998 est.) 169,000.

Carmel, also called CARMEL-BY-THE-SEA, city, Monterey county, western California, U.S., on the Carmel River and Carmel Bay, adjacent to Monterey. The river was named by the Spanish explorer Sebastián Vizcaíno and a group of Carmelite friars in 1602. The nearby Mission San Carlos Borromeo del Rio Carmelo was founded in 1770 at Monterey by the Spanish Franciscan missionary Junípero Serra; it was moved to the Carmel area in 1771, and Serra is buried in the sanctuary. The city, which was founded in 1904 as an art colony, has few sidewalks or street signs and has a wide mixture of architectural styles. Tourism is the economic mainstay. In addition to many art

galleries and the Carmel Mission, attractions include the Biblical Garden, Point Lobos State Reserve, 3 mi (5 km) south, and the scenic

Carmel, Mount, Hebrew *HA HA-KARMEI*, mountain range, northwestern Israel; the city of Haifa is on its northeastern slope. It divides the Plain of Esdraelon ('Emeq Yizre'el) and the Galilee (east and north) from the coastal Plain of Sharon (south). A northwest-southeast-trending limestone ridge, about 16 mi (26 km) long, it covers an area of about 95 sq mi (245 sq km). Its seaward point, Rosh ha-Karmel (Cape Carmel), almost reaches the Mediterranean; there the coastal plain is only 600 ft (180 m) wide. The mountain's highest point, 1,791 ft above sea level, is northwest of the village of 'Isfiyā. The name, dating back to biblical times, is derived from the Hebrew *kerem* ("vineyard" or "orchard") and attests to the mountain's fertility even in ancient times.

Sanctified since early times, Mt. Carmel is mentioned as a "holy mountain" in Egyptian records of the 16th century BC. As a "high place," it was long a centre of idol worship, and its outstanding reference in the Bible is as the scene of Elijah's confrontation with the false prophets of Baal (I Kings 18). Mt. Carmel was also sacred to the early Christians; individual hermits settled there as early as the 6th century AD. The Carmelites, a Roman Catholic monastic order, were founded in 1150; they received their first rule, or laws and regulations governing the conduct of their order, in 1206-14. Their monastery (rebuilt 1828) is near the traditional site of Elijah's miracle.

There are many fine parks and woods on the slopes of the mountain, both within the city of Haifa (*q.v.*) and outside it. Much of the wooded area is included in the Carmel Nature Reserve. On the southwest slopes are caves where archaeologists found (1931-32) Stone Age human skeletons of a type previously unknown.

Carmelite, member of one of the four great mendicant orders (those orders whose corporate as well as personal poverty made it necessary for them to beg for alms) of the Middle Ages. The origin of the order can be traced to Mt. Carmel in Palestine, where a number of devout men, apparently former pilgrims and crusaders, established themselves near the traditional fountain of Elijah, an Old Testament prophet, about 1155. Their rule was written between 1206 and 1214 by St. Albert, Latin patriarch of Jerusalem, and approved in 1226 by Pope Honorius III. The monks hoped to continue on Mt. Carmel the way of life of the prophet Elijah, whom early Christian writers depict as the founder of monasticism.

The early Carmelites were hermits: they lived in separate cells or huts and observed vows of silence, seclusion, abstinence, and austerity. Soon, however, the losses of the crusading armies in Palestine made Mt. Carmel unsafe for the Western hermits, and they set out, in about 1240, for Cyprus, Sicily, France, and England. The first general chapter (legislative meeting) of the Carmelites was held in England in 1247 under St. Simon Stock, and the order was adapted to the conditions of the Western lands to which it had been transplanted: the order transformed itself from one of hermits into one of mendicant friars. In this form the Carmelites established themselves throughout western Europe, becoming popular as an order closely analogous to the Dominicans and Franciscans. The first institution of Carmelite nuns was founded in 1452.

Of all the movements in the Carmelite order, by far the most important and far-reaching in its results was the reform initiated by St. Teresa of Avila. After nearly 30 years in a Carmelite convent, she founded (1562) in Avila a small convent wherein a stricter way of life was to be observed; it became the order of Discalced Carmelite Nuns (O.D.C.). In spite of opposition and difficulties of many kinds, St. Teresa succeeded in establishing not only nunneries but also, with the cooperation of Juan de Yepes (later St. John of the Cross), a number of friaries of this stricter observance. The aim of the reform was to restore and emphasize the austerity and contemplative character of primitive Carmelite life. Because Reformed Carmelites wore sandals in place of shoes and stockings, they came to be called the Discalced, or barefooted, Carmelites, to distinguish them from the older branch of the order. In 1580 the reformed monasteries were made a separate province under the prior general of the order, and in 1593 this province became by papal act an independent order.

Both orders suffered severely from the French Revolution and from suppression both by Napoleon and the liberal governments of the 19th century, but they have since been restored in most countries of western Europe, in the Middle East, Latin America, and the United States. The original order (Order of Brothers of the Blessed Virgin Mary of Mt. Carmel; White Friars; O.Carm.) is engaged primarily in preaching and teaching. The Discalced Carmelite Fathers (Order of Discalced Brothers of the Blessed Virgin Mary of Mt. Carmel; O.C.D.) is active in parishes and in foreign missions, having become primarily a pastoral and devotional order. Both branches have been important promoters of Marian devotion. Besides the cloistered nuns, in recent times, numerous congregations of active sisterhoods, Third Order Carmelites, have been formed, devoted to teaching, care of the sick, and other charitable works.

Carmichael, Hoagy, byname of HOAGLAND HOWARD CARMICHAEL (b. Nov. 22, 1899, Bloomington, Ind., U.S.—d. Dec. 27, 1981,

Hoagy Carmichael
EB Inc.

Rancho Mirage, Calif.), U.S. self-taught pianist, composer, singer, and actor who composed many of the most popular songs of the big-band era.

While studying at Indiana University, Bloomington (LL.B., 1926), he came to know jazz musicians, including the cornettist Bix Beiderbecke, for whom he named one of his sons. His first composition, "Riverboat Shuffle," which became a jazz classic, was recorded by Beiderbecke and the Wolverines, a jazz group based in Chicago, in 1924. Carmichael went on to compose a series of popular songs whose melodic structure and harmonic interest made them attractive to many musicians, including Louis Armstrong and Jack Teagarden. These songs included "Georgia on My Mind" (1930), "Rockin' Chair" (1930), and "Lazy River" (1931). Working in Hollywood, first as a writer and then as a character actor, he produced other hit songs, including "Thanks for the Memory" (1938), "Two Sleepy People" (1939), and "In The Cool Cool Cool of the Evening," for which he won an Academy Award in 1951. But probably his most successful song and one reputed to be the most frequently recorded popular composition of all time was "Stardust," the first version of which was written in 1927.

Carmichael continued to write songs, and he performed as an actor into the 1970s; his motion-picture credits include *To Have and Have Not* (1944), *Canyon Passage* (1946), and *Young Man with a Horn* (1950). He also wrote two volumes of memoirs: *The Stardust Road* (1946) and *Sometimes I Wonder* (1965).

Carmichael, Leonard (b. Nov. 9, 1898, Philadelphia—d. Sept. 16, 1973, Washington, D.C.), U.S. psychologist and educator who, as secretary of the Smithsonian Institution from 1953 to 1964, was responsible for the modernization of the "nation's attic."

Carmichael received his Ph.D. from Harvard University (1924) and was teacher of psychology at Princeton, Brown, and Rochester successively. He became president of Tufts in 1938, leaving it to go to the Smithsonian. On his retirement there he became (1964) vice president for research and exploration at the National Geographic Society, where he sponsored the work of, among others, L.S.B. Leakey and Jacques-Yves Cousteau. Author or editor of several books on psychology, he also served terms as president of the American Psychological Association and of the American Philosophical Society.

Carmiel (Israel): see Karmi'el.

Carmina Burana, German LIEDER AUS BEUERN, 13th-century manuscript that contains songs (the *Carmina Burana* proper) and six religious plays. The contents of the manuscript are attributed to the goliards (*q.v.*), wandering scholars and students in western Europe during the 10th to the 13th century who were known for their songs and poems in praise of revelry. The collection is also called the Benediktbeuern manuscript, because it was found (in 1803) at the Benedictine monastery in Benediktbeuern (from which *burana* is derived), Bavaria. The two parts of the manuscript, though written at the same time, have been separated. The songs, rhymed lyrics mainly in Latin with a few in German, vary in subject and style: there are drinking songs, serious and licentious love songs, religious poems, pastoral lyrics, and satires of church and government. Some of the poems were set to music by Carl Orff in his cantata *Carmina Burana* (1937).

The plays, in Latin, include the only known two surviving complete texts of medieval Passion dramas. These are the *Ludus brevier de Passione* ("Play in Brief of the Passion"), a prologue to a Resurrection play, and a longer text, probably amplified from a play on St. Mary Magdalene's life and the raising of

Lazarus. The other plays are an Easter play; an unusually comprehensive Christmas play; an enlarged *Peregrinus*, which treats Christ's first two appearances to the disciples; and *Ludus de rege Aegypti* ("Play of the King of Egypt"), formerly regarded as part of the Christmas play. See also goliard song.

carmina Fescennina (poetry): see Fescennine verse.

carmine, red or purplish-red pigment obtained from cochineal (*c.v.*), a red dyestuff extracted from the dried bodies of certain female scale insects native to tropical and subtropical America. Carmine was used extensively for watercolours and fine coach-body colours before the advent of synthetic colouring materials. Since then it has been used only when a natural pigment is required: for pastries, confections, cosmetics, water-soluble drug preparations, and histologic stains.

To prepare carmine, the powdered insect bodies are boiled in ammonia or sodium carbonate solution, the insoluble matter is removed by filtering, and alum is added to the clear salt solution of carminic acid to precipitate the red aluminum salt. Purity of colour is ensured by the absence of iron. Stannous chloride, citric acid, borax, or gelatin may be added to regulate the formation of the precipitate. For purple shades, lime is added to the alum. Chemically, carminic acid is a complex anthraquinone derivative.

Carmona (Angola): see Uíge.

Carmona, town, Sevilla province, in the autonomous community (region) of Andalusia, southern Spain; it overlooks the Andalusian Plain from its site on a ridge of the Sierra de los Alcóres. It originated as Carmo, the strongest town of the Roman province of Hispania Ulterior under Julius Caesar, and was captured from the Moors (who called it *Karmona*) in 1247 by Ferdinand III of Castile. Historic landmarks include the Roman walls and towers of the old city, the Gothic Santa María church (1424–1518), the San Pedro church (begun 1466), in the Churrigueresque style, and the ruins of the Alcázar de Arriba, which was the citadel of Peter the Cruel (1350–69). A large Roman necropolis, discovered nearby in 1881, has been excavated.

The modern town is a processing and agricultural centre (livestock, fruits, grapes, cereals, olives, and olive oil). Pop. (1999 est.) 25,403.

Carmona, António Oscar de Fragoso (b. Nov. 24, 1869, Lisbon—d. April 18, 1951, Lisbon), general and statesman who rose to political prominence in the wake of the successful military revolt of 1926 and who as president of Portugal from 1928 to 1951 served as a symbol of continuity during the regime (1932–68) of António de Oliveira Salazar.

Carmona, a graduate (1888) of the Royal Military College, had risen to the rank of general by 1922. He took part in the successful army coup of May 1926 and, after serving briefly as foreign minister, became premier in July. He named as finance minister Salazar, who soon came to overshadow Carmona himself. After a bloody rebellion had been put down in February 1927, Carmona called a plebiscite and was elected president. He named Salazar as premier in 1932. In the following year a constitution for the "New State" was adopted, under which Carmona was elected president three times: in 1935, 1942, and 1949.

Carnac, village, Morbihan *département*, Bretagne region, western France, near the Atlantic coast, just southwest of Auray. It is the site of more than 3,000 prehistoric stone monuments. The single stone menhirs and multi-stone dolmens were hewn from local granite, now worn by time and weather and sheathed in white lichen. Venerated by the Bretons until fairly recent times, the stones were adopted by the Romans for religious purposes, and

The Ménez System of menhirs, or standing stones, near Carnac, Fr., Late Neolithic Period (c. 1800 bc)

Photo Ciccione—Rapho/Photo Researchers

Roman deities were carved on some. When Christianity came, the local attachment to the megaliths was diverted to the new faith by the addition of crosses and other symbols.

Dating of the monuments is complicated because they were erected at differing periods, including early, middle, and late Neolithic. Most remarkable of the monuments are the long avenues of menhirs, or standing stones; about 0.5 mi (0.8 km) northwest of the village, the Ménez System traces 11 lines over a distance of 3,376 ft (1,029 m), its terminal circle being broken by a small hamlet; east-northeast the Kermario System of 10 lines stretches for about 4,000 ft, and farther along the same road are the 13 Kerlescan Lines, terminating in an irregular circle after 0.5 mi. The alignment of Kermario points to the passage grave of Kercado, covered by a barrow, explored in 1863. A year earlier René Galles had explored the great tumulus of Mont-Saint-Michel, 65 ft high, 377 ft long. In 1874 James Miln, a Scottish antiquary, uncovered the remains of a Gallo-Roman villa in the mound-covered moorland 1 mi east of the village. The Musée Miln-Le Rouzic in Carnac has an important collection of artifacts. Pop. (1999) 4,443.

carnallite, a soft, white halide mineral, hydrated potassium and magnesium chloride ($\text{KMgCl}_3 \cdot 6\text{H}_2\text{O}$), that is a source of potassium for fertilizers. Carnallite occurs with other chloride minerals in the upper layers of marine salt deposits, where it appears to be an alteration product of pre-existing salts. The mineral is found principally in the northern German salt deposits; and also in Spain, Tunisia, and the southwestern United States. For detailed physical properties, see halide mineral (table).

Carnap, Rudolf (b. May 18, 1891, Ronsdorf, Ger.—d. Sept. 14, 1970, Santa Monica, Calif., U.S.), German-born U.S. philosopher of Logical Positivism. He made important contributions to logic, the analysis of language, the theory of probability, and the philosophy of science.

Carnap, 1960

By courtesy of the University of California, Los Angeles

Education. From 1910 to 1914 Carnap studied mathematics, physics, and philosophy at the universities of Jena and Freiburg im Breisgau. At Jena he attended the lectures of Gottlob Frege, now widely acknowledged as the greatest logician of the 19th century, whose ideas exerted a deep influence on Carnap.

After serving in World War I, Carnap earned his doctorate in 1921 at Jena with a dissertation on the concept of space. He argued that the conflicts among the various theories of space then held by scholars resulted from the fact that those theories actually dealt with quite different subjects; he called them, respectively, formal space, physical space, and intuitive space and exhibited their principal characteristics and fundamental differences.

For several years afterward Carnap was engaged in private research in logic and the foundations of physics and wrote a number of essays on problems of space, time, and causality, as well as a textbook in symbolic, or mathematical, logic (*Abriß der Logistik*, 1929; a considerably different later German version appeared in English translation: *Introduction to Symbolic Logic and Its Applications*, 1958).

Career in Vienna and Prague. In 1926 Moritz Schlick, the founder of the Vienna Circle—a small group of philosophers, mathematicians, and other scholars who met regularly to discuss philosophical issues—invited Carnap to join the faculty of the University of Vienna, where he soon became an influential member of the Circle. Out of their discussions developed the initial ideas of Logical Positivism, or Logical Empiricism. This school of thought shared its basic Empiricist orientation with David Hume, a Scottish Empiricist, and Ernst Mach, an Austrian physicist and philosopher. Its leading members, informed and inspired by the methods and theories of contemporary mathematics and science, sought to develop a "scientific world view" by bringing to philosophical inquiry the precision and rigour of the exact sciences. As one means to this end, Carnap made extensive use of the concepts and techniques of symbolic logic in preference to the often inadequate analytic devices of traditional logic.

Carnap and his associates established close connections with like-minded scholars in other countries, among them a group of Empiricists that had formed in Berlin under the leadership of Hans Reichenbach, an eminent philosopher of science. With Reichenbach, Carnap founded a periodical, *Erkenntnis* (1930–40), as a forum for the new "scientific philosophy."

The basic thesis of Empiricism, in a familiar but quite vague formulation, is that all of man's concepts and beliefs concerning the world ultimately derive from his immediate experience. In some of his most important writings, Carnap sought, in effect, to give this idea a clear and precise interpretation. Setting aside, as a psychological rather than a philosophical problem, the question of how human beings arrive at their ideas about the world, he proceeded to construe Empiricism as a systematic-logical thesis about the evidential grounding of empirical knowledge. To this end, he gave the issue a characteristically linguistic turn by asking how the terms and sentences that, in scientific or in everyday language, serve to express assertions about the world are related to those terms and sentences by which the data of immediate experience can be described. The Empiricist thesis, as construed and defended by Carnap, then asserts that the terms and sentences of the first kind are "reducible" to those of the second kind in a clearly specifiable sense. Carnap's conception of the relevant sense of reducibility, which he always stated in precise logical terms, was initially rather narrow but gradually became more liberal.

In his first great work, *Der logische Aufbau der Welt* (1928; Eng. trans.—with a smaller work—*The Logical Structure of the World: Pseudoproblems in Philosophy*), Carnap developed, with unprecedented rigour, a version of the Empiricist reducibility thesis according to which all terms suited to describe actual or possible empirical facts are fully definable by terms referring exclusively to aspects of immediate experience, so that all empirical statements are fully translatable into statements about immediate experiences.

Prompted by discussions with his associates in Vienna, Carnap soon began to develop a more liberal version of Empiricism, which he elaborated while he was professor of natural philosophy at the German University in Prague (1931–35); he eventually presented it in full detail in his essay “Testability and Meaning” (*Philosophy of Science*, vol. 3 [1936] and 4 [1937]). Carnap argued that the terms of empirical science are not fully definable in purely experiential terms but can at least be partly defined by means of “reduction sentences,” which are logically much-refined versions of operational definitions, and “observation sentences,” whose truth can be checked by direct observation. Carnap stressed that usually such tests cannot provide strict proof or disproof but only more or less strong “confirmation” for an empirical statement.

Sentences that do not thus yield observational implications and therefore cannot possibly be tested and confirmed by observational findings were said to be empirically meaningless. By reference to this testability criterion of empirical significance, Carnap and other Logical Empiricists rejected various doctrines of speculative metaphysics and of theology, not as being false but as making no significant assertions at all.

Carnap argued that the observational statements by reference to which empirical statements can be tested may be construed as sentences describing directly and publicly observable aspects of physical objects, such as the needle of a measuring instrument turning to a particular point on the scale or a subject in a psychological test showing a change in pulse rate. All such sentences, he noted, can be formulated in terms that are part of the vocabulary of physics. This was the basic idea of his “physicalism,” according to which all terms and statements of empirical science—from the physical to the social and historical disciplines—can be reduced to terms and statements in the language of physics.

In later writings, Carnap liberalized his conception of reducibility and of empirical significance even further so as to give a more adequate account of the relation between scientific theories and scientific evidence.

Career in the United States. By the time “Testability and Meaning” appeared in print, Carnap had moved to the United States, mainly because of the growing threat of German National Socialism. From 1936 to 1952 he served on the faculty of the University of Chicago. During the 1940–41 school year, Carnap was a visiting professor at Harvard University and was an active participant in a discussion group that included Bertrand Russell, Alfred Tarski, and W.V.O. Quine.

Soon after going to Chicago, Carnap joined with the sociologist Otto Neurath, a former fellow member of the Vienna Circle, and with an academic colleague, the Pragmatist philosopher Charles W. Morris, in founding the *International Encyclopedia of Unified Science*, which was published, beginning in 1938, as a series of monographs on general problems in the philosophy of science and on philosophical issues concerning mathematics or particular branches of empirical science.

Since his Vienna years, Carnap had been

much concerned also with problems in logic and in the philosophy of language. He held that philosophical perplexities often arise from a misunderstanding or misuse of language and that the way to resolve them is by “logical analysis of language.” On this point, he agreed with the “ordinary language” school of Analytic Philosophy, which had its origins in England. He differed from it, however, in insisting that more technical issues—e.g., those in the philosophy of science or of mathematics—cannot be adequately dealt with by considerations of ordinary linguistic usage but require clarification by reference to artificially constructed languages that are formulated in logical symbolism and that have their structure and interpretation precisely specified by so-called syntactic and semantic rules. Carnap developed these ideas and the theoretical apparatus for their implementation in a series of works, including *Logische Syntax der Sprache* (1934; *The Logical Syntax of Language*) and *Meaning and Necessity* (1947; 2nd enlarged ed., 1956).

Carnap’s interest in artificial languages included advocacy of international auxiliary languages such as Esperanto and Interlingua to facilitate scholarly communication and to further international understanding.

One idea in logic and the theory of knowledge that occupied much of Carnap’s attention was that of analyticity. In contrast to the 19th-century radical Empiricism of John Stuart Mill, Carnap and other Logical Empiricists held that the statements of logic and mathematics, unlike those of empirical science, are analytic—i.e., true solely by virtue of the meanings of their constituent terms—and that they can therefore be established a priori (without any empirical test). Carnap repeatedly returned to the task of formulating a precise characterization and theory of analyticity. His ideas were met with skepticism by some, however—among them Quine, who argued that the notion of analytic truth is inherently obscure and the attempt to delimit a class of statements that are true a priori should be abandoned as misguided.

From about 1945 onward, Carnap turned his efforts increasingly to problems of inductive reasoning and of rational belief and decision. His principal aim was to construct a formal system of inductive logic; its central concept, corresponding to that of deductive implication, would be that of probabilistic implication—or, more precisely, a concept representing the degree of rational credibility or of probability that a given body of evidence may be said to confer upon a proposed hypothesis. Carnap presented a rigorous theory of this kind in his *Logical Foundations of Probability* (1950).

Carnap spent the years from 1952 to 1954 at the Institute for Advanced Study in Princeton, where he continued his work in probability theory. Subsequently, he accepted a professorship at the University of California at Los Angeles. During those years and indeed until his death, Carnap was occupied principally with modifications and considerable extensions of his inductive logic.

(C.G.H.)
BIBLIOGRAPHY. Norman M. Martin’s article on Carnap in *The Encyclopedia of Philosophy*, ed. by Paul Edwards, vol. 2 (1967), pp. 25–33, gives a lucid survey of Carnap’s work and the development of his ideas with extensive bibliography. An especially valuable source is *The Philosophy of Rudolf Carnap*, ed. by P.A. Schilpp (1963). Roger C. Buck and Robert S. Cohen (eds.), *PSA 1970: In Memory of Rudolf Carnap* (1971), is a large collection of essays on his qualities as a man, a teacher, and a thinker.

Carnarvon (Wales); see Caernarvon.

Carnarvon, George Edward Stanhope Molyneux Herbert, 5th earl of, BARON PORCHESTER OF HIGHCLERE (b. June 26, 1866, Highclere Castle, Berkshire, Eng.—d. April 5, 1923, Cairo), British Egyptologist who

was the patron and associate of archaeologist Howard Carter in the discovery of the tomb of King Tutankhamen.

Carnarvon was educated at Eton and at Trinity College, Cambridge. He began excavations in Thebes in 1906, but, as an amateur, he soon felt the need of expert advice and sought the help of Carter, a former official of the Egyptian government’s antiquities department. Their collaboration began in 1907, when Carter agreed to supervise excavations for Carnarvon. They published an account of their work, which included discoveries of tombs of the 12th and 18th dynasties, in 1912: *Five Years’ Exploration at Thebes*.

Excavations resumed after World War I, and on Nov. 4, 1922, Carter unearthed the tomb of Tutankhamen in the Valley of the Tombs of Kings. On Feb. 16–17, 1923, the sepulchral chamber was opened, the actual sarcophagus

5th Earl of Carnarvon, engraving after a photograph, 1899

being discovered on Jan. 3, 1924. Carnarvon died in a Cairo hospital from infections and complications that arose after he was bitten by a mosquito while in Thebes to visit the just-opened burial chamber of the tomb.

Carnarvon, Henry Howard Molyneux Herbert, 4th earl of, BARON PORCHESTER OF HIGHCLERE (b. June 24, 1831, London—d. June 28, 1890, London), British statesman, a liberally inclined member of Conservative Party governments, who tried, with varying success, to establish federal self-government in British overseas possessions.

He was educated at Eton and Christ Church, Oxford, inheriting his father’s earldom in 1849. He was undersecretary for the colonies in 1858–59 and served two terms as colonial secretary (1866–67 and 1874–78). In his first term he realized his greatest achievement—passage of the British North America Act (1867), which gave Canada its federal system and dominion status. In his second term of office, however, his 1875 proposal for a South African federation on the Canadian pattern failed. In 1878 he proposed the so-called Carnarvon Terms, which a few years later provided the settlement of a major dis-

pute between Canada and the British that was delaying the construction of the Canadian Pacific Railway.

In the 3rd marquess of Salisbury's first ministry (1885–86) Carnarvon served as lord lieutenant (viceroys) of Ireland, despite his having voted for Liberal Party legislation intended to conciliate Irish nationalists. On Aug. 1, 1885, he and the Irish leader Charles Stewart Parnell held a secret and futile discussion of the possibility of Irish Home Rule. Parnell had been misled into believing that Ireland might be conceded the status of a self-governing province within a federal United Kingdom. In the end, Carnarvon could not find a settlement acceptable to both Salisbury and Parnell.

Carnarvon Gorge, gorge in southeastern Queensland, Australia, on the eastern slopes of Carnarvon Range of the Great Dividing Range. The gorge, sometimes called "The Grand Canyon of Queensland," is about 20 miles (32 km) long and 150 to 1,200 feet (45 to 370 m) wide, with vertical sandstone walls rising 600 feet (180 m). In some sections the sandstone has been so undercut by erosion that hikers at the bottom cannot see the top directly upward. The gorge is the central feature of the 969-square-mile (2,510-square-kilometre) Carnarvon National Park (1932), which also offers caves containing Aboriginal art and highly diverse plant and wildlife.

Carnarvon Range, plateau section of the Great Dividing Range, southeast-central Queensland, Australia. The Carnarvon Range lies 230 to 280 miles (370 to 450 km) inland from the coast west of Bundaberg and extends 100 miles (160 km) south. Its peaks average 3,000 feet (900 m) in elevation. The range was first explored by Ludwig Leichhardt (1813–48). It is the source of the Dawson River and is accessible by the Carnarvon Highway and a rail line, both of which lead to Injune. Lying within an extensive natural reserve, the range has been developed as a resort area offering spectacular terrain, Aboriginal cave art, and a wide variety of plant and wildlife. Brisbane is 350 miles (560 km) southeast by air.

Carnatic (India); see Karnāṭaka.

Carnatic music, also spelled KARNATIC MUSIC, music of southern India (generally south of the city of Hydrābād in Andhra Pradesh state) that evolved from ancient Hindu traditions and was relatively unaffected by the Arabic and Iranian influences that, since the late 12th and early 13th centuries, as a result of the Islāmic conquest of the north, have characterized the Hindustani music of northern India. In contrast to northern styles, Carnatic music is more thoroughly oriented to the voice. Even when instruments are used alone, they are played somewhat in imitation of singing, generally within a vocal range, and with embellishments that are characteristic of vocal music. Fewer instruments are used in Carnatic than in northern Indian music, and there are no exclusively instrumental forms.

The basic principles of raga (melody type, or framework for improvisation) and tāla (cyclical rhythmic pattern) are the same in the south and north, but each musical tradition has its own repertoire of actual ragas and tālas, and there are many stylistic differences as well. Carnatic music, with its more homogeneous Indian tradition, has evolved far more orderly and uniform systems for the classification of ragas and tālas.

To many listeners, the music of the south has a restrained and intellectual character as compared with the music of the more secular Hindustani traditions. The chief centres for present-day Carnatic music include Tamil Nadu (formerly Madras), Karnāṭaka (formerly Mysore), Andhra Pradesh, and Kerala states.

Carnatic Wars, also spelled KARNATIC WARS, series of military contests during the 18th

century between the British, the French, the Marāṭhās, and Mysore for control of the coastal strip of eastern India from Nellore (north of Madras) southward (the Tamil country). The name Carnatic properly refers to the region occupied by the Kannada-speaking people, which roughly corresponds to the modern Indian state of Karnāṭaka (formerly Mysore). In the 18th century the coastal Carnatic was a dependency of Hydrābād, within the Mughal Empire.

Succession disputes in both the Carnatic and Hydrābād opened the door for European intervention as supporters of various rival Indian claimants. At first the French, under Joseph Dupleix, governor of Pondicherry (1742–54), were successful both in the Carnatic and in Hydrābād, which the French officer Charles-Joseph Patissier, marquis de Bussy-Castelnau, controlled for seven years. Dupleix was checked by forces of the English East India Company under Robert Clive in 1751, however, and the French claimant was defeated the next year. In the Seven Years' War (1756–63), both the French and British sent armies to South India; the French were defeated at Wandiwash (1760), and the British captured Pondicherry (1761). Thenceforth the British controlled the Carnatic through its nawab, who became deeply indebted both to the English East India Company and to its individual officers. For later events, see Mysore Wars.

carnation, also called GRENADINE, or CLOVE PINK (*Dianthus caryophyllus*), herbaceous plant of the pink family (Caryophyllaceae), native to the Mediterranean area. It is widely cultivated for its fringe-petaled flowers, which often have a spicy fragrance.

There are two general groups, the border, or garden, carnations and the perpetual flowering carnations. Border carnations include a range of varieties and hybrids, 30 to 75 cm (1 to 2½ feet) tall; the flowers, in a wide range of colours, are usually less than 5 cm (2 inches) in diameter and are borne on wiry, stiffly erect stems. The bluish green leaves are narrow, sheathing the stems; swellings appear at leaf and stem joints.

The perpetual flowering carnation, perhaps derived from crosses between the border carnations and the China pink (*D. sinensis*), is taller, up to 1 m (3 feet) in height, is stouter, and produces larger flowers; it blooms almost continuously in the greenhouse. Miniature (baby) and spray varieties of the perpetual carnation are also grown for the florist trade.

Carnations are among the most popular cut flowers, used in floral arrangements, corsages, and boutonnières. In 1907 Anna Jarvis of Philadelphia selected the pink carnation as the symbol for Mother's Day. In Europe the carnation was formerly used as a treatment for fevers. It was also used to spice wine and ale during Elizabethan times, as a substitute for the more expensive clove.

carnauba wax, very hard wax obtained from the fronds of the carnauba tree, *Copernicia cerifera*, a fan palm of Brazil. During the regular dry seasons in Brazil, where it is called the tree of life, the carnauba palm protects its fanlike fronds from loss of moisture by secreting a coat of carnauba wax. Carnauba has been used in high-gloss polishes, phonograph records, and explosives. Synthetics have replaced it for many applications.

Carné, Marcel (b. Aug. 18, 1906, Paris, France—d. Oct. 31, 1996, Clamart, near Paris), motion-picture director noted for the poetic realism of his pessimistic dramas. He led the French cinema revival of the late 1930s.

After holding various jobs, Carné joined the director Jacques Feyder as an assistant in 1928, and he also assisted René Clair on the popular comedy *Sous les toits de Paris* (1930; "Under the Roofs of Paris"). Carné's first

picture was a short documentary, *Nogent, Eldorado du dimanche* (1929; *Nogent, Sunday's Eldorado*). Later the success of his film *Jenny* (1936) ensured his position as a leading director.

The screenplay for *Jenny* was by the poet Jacques Prévert, who would write the scripts for all but one of Carné's finest films. Carné's next picture, the comic crime fantasy *Drôle de drame* (1937; *Bizarre, Bizarre*), had sets designed by Alexandre Trauner, and both he and the composer Joseph Kosma also became regular collaborators on Carné's films. *Quai des brumes* (1938; *Port of Shadows*) and *Le Jour se lève* (1939; *Daybreak*) established Carné as the preeminent director of the revival. In these films, whose fatalism was typical of the French cinema of the late 1930s, a pair of lovers find a few brief moments of happiness in a gloomy, mist-shrouded world of violence

Carné

Tele 7 Jours

and hopelessness. The actor Jean Gabin became famous for his roles as the doomed hero in these films.

During World War II, when it was impossible to deal effectively with contemporary subjects under the German occupation, Carné made two important period films. *Les Visiteurs du soir* (1942; *The Devil's Envoys*), a costume drama that combines spectacle with romantic passion, is photographed with the lyricism and flowing smoothness characteristic of all Carné's films. *Les Enfants du paradis* (1945; *Children of Paradise*), a fictionalized portrait of the mime Jean-Gaspard Deburau, paints a rich and powerfully evocative picture of 19th-century French theatrical society and is regarded as Carné's masterpiece.

Carné continued to make films into the 1970s, but with declining popular success. *Les Portes de la nuit* (1946; *Gates of Night*), was his last collaboration with Prévert, and his subsequent films, such as *Thérèse Raquin* (1953) and *Les Tricheurs* (1958; *The Cheaters*), rarely approach the quality of his best work. He was gradually reduced to a peripheral figure on the French film scene owing to changing tastes and attitudes. The freedom and spontaneity of the New Wave cinema in the early 1960s made his own carefully scripted and rehearsed films seem cold and old-fashioned. *Les Enfants du paradis*, however, is still one of the most admired of all French motion pictures.

Carneades (b. 214? BC—d. 129?), Greek philosopher who headed the New Academy at Athens when antidogmatic skepticism reached its greatest strength.

A native of Cyrene (now in Libya), Carneades went in 155 BC on a diplomatic mission to Rome, where he delivered two public orations, in which he argued in favour of justice in one speech and argued against it in the other. This arguing on both sides of a question expressed Carneades' attitude of suspending judgment, an attitude characteristic of academic, or antidogmatic, skepticism. The facility Carneades displayed in this regard helped arouse the first Roman interest in Greek philosophy, while also arousing the distrust of the Roman authorities.

Ultimately, Carneades' noncommittal attitude was rooted in his denial that there exists any certain knowledge, either of the senses or of the intellect. In this spirit, he criticized both Epicurean and stoic beliefs as inconclusive. Many of his arguments on this point later attained classic status. Carneades also defended the philosopher Arcesilaus against the stoics and Epicureans in the controversy over knowledge. Because no reliable criterion of truth exists, Carneades argued, Arcesilaus was right to urge the withholding of assent from any experience that claimed to be knowledge. Though Carneades left no writings, his teachings were preserved by Cleitomachus.

Carnegie, Andrew (b. Nov. 25, 1835, Dunfermline, Fife, Scot.—d. Aug. 11, 1919, Lenox, Mass., U.S.), Scottish-born American industrialist who led the enormous expansion of the American steel industry in the late 19th century. He was also one of the most important philanthropists of his era.

Carnegie's father, William Carnegie, a handloom weaver, was a Chartist and marcher for

Andrew Carnegie
Brown Brothers

workingman's causes; his maternal grandfather, Thomas Morrison, also an agitator, had been a friend of William Cobbett. During the young Carnegie's childhood the arrival of the power loom in Dunfermline and a general economic downturn impoverished his father, inducing the Carnegies to immigrate in 1848 to the United States, where they joined a Scottish colony of relatives and friends in Allegheny, Pa. (now part of Pittsburgh). Young Andrew began work at age 12 as a bobbin boy in a cotton factory. He quickly became enthusiastically Americanized, educating himself by reading and writing and attending night school.

At age 14 Carnegie became a messenger in a telegraph office, where he eventually caught the notice of Thomas Scott, a superintendent

of the Pennsylvania Railroad Company, who made Carnegie his private secretary and personal telegrapher in 1853. Carnegie's subsequent rise was rapid, and in 1859 he succeeded Scott as superintendent of the railroad's Pittsburgh division. While in this post he invested in the Woodruff Sleeping Car Company (the original holder of the Pullman patents) and introduced the first successful sleeping car on American railroads. He had meanwhile begun making shrewd investments in such industrial concerns as the Keystone Bridge Company, the Superior Rail Mill and Blast Furnaces, the Union Iron Mills, and the Pittsburgh Locomotive Works. He also profitably invested in a Pennsylvania oilfield and he took several trips to Europe, selling railroad securities. By the age of 30 he had an annual income of \$50,000.

During his trips to Britain he came to meet steelmakers. Foreseeing the future demand for iron and steel, Carnegie left the Pennsylvania Railroad in 1865 and started managing the Keystone Bridge Company. From about 1872-73, at about age 38, he began concentrating on steel, founding the J. Edgar Thomson Steel Works near Pittsburgh, which would eventually evolve into the Carnegie Steel Company. In the 1870s Carnegie's new company built the first steel plants in the United States to use the new Bessemer steel-making process, borrowed from Britain. Other innovations followed, including detailed cost- and production-accounting procedures that enabled the company to achieve greater efficiencies than any other manufacturing industry of the time. Any technological innovation that could reduce the cost of making steel was speedily adopted, and in the 1890s Carnegie's mills introduced the basic open-hearth furnace into American steelmaking. Carnegie also obtained greater efficiency by purchasing the coke fields and iron-ore deposits that furnished the raw materials for steelmaking, as well as the ships and railroads that transported these supplies to his mills. The vertical integration thus achieved was another milestone in American manufacturing. Carnegie also recruited extremely capable subordinates to work for him, including the administrator Henry Clay Frick, the steelmaster and inventor Captain Bill Jones, and his own brother Thomas M. Carnegie.

In 1889 Carnegie's vast holdings were consolidated into the Carnegie Steel Company, a limited partnership that henceforth dominated the American steel industry. In 1890 the American steel industry's output surpassed that of Great Britain's for the first time, largely owing to Carnegie's successes. The Carnegie Steel Company continued to prosper even during the depression of 1892, which was marked by the bloody Homestead strike. (Although Carnegie professed support for the rights of unions, his goals of economy and efficiency may have made him favour local management at the Homestead plant, which used Pinkerton guards to try to break the Amalgamated Association of Iron, Steel, and Tin Workers.)

In 1900 the profits of Carnegie Steel (which became a corporation) were \$40,000,000, of which Carnegie's share was \$25,000,000. Carnegie sold his company to J.P. Morgan's newly formed United States Steel Corporation for \$250,000,000 in 1901. He subsequently retired and devoted himself to his philanthropic activities, which were themselves vast.

Carnegie wrote frequently about political and social matters, and his most famous article, "Wealth," appearing in the June 1889 issue of the *North American Review*, outlined what came to be called the Gospel of Wealth. This doctrine held that a man who accumulates great wealth has a duty to use his surplus wealth for "the improvement of mankind" in philanthropic causes. A "man who dies rich dies disgraced."

Carnegie's own distributions of wealth came to total about \$350,000,000, of which \$62,000,000 went for benefactions in the British Empire and \$288,000,000 for benefactions in the United States. His main "trusts," or charitable foundations, were (1) the Carnegie Trust for the Universities of Scotland (Edinburgh), founded in 1901 and intended for the improvement and expansion of the four Scottish universities and for Scottish student financial aid, (2) the Carnegie Dunfermline Trust, founded in 1903 and intended to aid Dunfermline's educational institutions, (3) the Carnegie United Kingdom Trust (Dunfermline), founded in 1913 and intended for various charitable purposes, including the building of libraries, theatres, child-welfare centres, and so on, (4) the Carnegie Institute of Pittsburgh, founded in 1896 and intended to improve Pittsburgh's cultural and educational institutions, (5) the Carnegie Institution of Washington, founded in 1902 and contributing to various areas of scientific research, (6) the Carnegie Endowment for International Peace, founded in 1910 and intended to disseminate (usually through publications) information to promote peace and understanding among nations, (7) the Carnegie Corporation of New York, the largest of all Carnegie foundations, founded in 1911 and intended for "the advancement and diffusion of knowledge and understanding among the people of the United States" and, from 1917, Canada and the British colonies. The Carnegie Corporation of New York has aided colleges and universities and libraries, as well as research and training in law, economics, and medicine.

Chief among Carnegie's writings are *Triumph of Democracy* (1886; rev. ed. 1893), *The Gospel of Wealth*, a collection of essays (1900), *The Empire of Business* (1902), *Problems of To-day* (1908), and *Autobiography* (1920).

Carnegie married Louise Whitfield in 1887. Until World War I, the Carnegies alternated between Skibo Castle in northern Scotland, their home in New York City, and their summer house "Shadowbrook" in Lenox, Mass.

BIBLIOGRAPHY. For historical and social background, see Louis M. Hacker, *The World of Andrew Carnegie: 1865-1901* (1968); and George S. Bobinski, *Carnegie Libraries* (1969). Biographies include Joseph Frazier Wall, *Andrew Carnegie* (1970, reissued 1989), a massive definitive study; and Harold C. Livesay, *Andrew Carnegie and the Rise of Big Business* (1975, reissued 1988). Carnegie's many writings are discussed in George Swetnam, *Andrew Carnegie* (1980).

Carnegie, Dale, original name DALE CARNEGEY (b. Nov. 24, 1888, Maryville, Mo., U.S.—d. Nov. 1, 1955, Forest Hills, N.Y.), American lecturer, author, and pioneer in the field of public speaking and the psychology of the successful personality.

Carnegie was born to poverty on a farm in Missouri. In high school and college he was active in debating clubs. Upon graduating, he was a salesman in Nebraska and an actor in New York City and finally taught public speaking at the YMCA. His classes became extremely successful, and Carnegie began lecturing to packed houses. To standardize his teaching methods he began publishing pamphlets, which he collected into book form as *Public Speaking: A Practical Course for Business Men* (1926; also published as *Public Speaking and Influencing Men in Business*). At this time he also served as manager for a lecture tour with Lowell Thomas and compiled *Little Known Facts About Well Known People* (1934).

Carnegie became an instant success with the hugely popular *How To Win Friends and Influence People* (1936). Like most of his books, it reveals little that was unknown about human psychology but stresses that an individual's attitude is crucial. He taught that anyone could benefit from a handicap if it was ad-

vantageously presented. Carnegie capitalized on the American longing for success by selling advice that helped readers feel, and perhaps become, successful. Other books include *How to Stop Worrying and Start Living* (1948), which is primarily a collection of common-sense tricks to prevent stress.

Carnegie Hall, historic concert hall at Seventh Avenue and 57th Street in New York City. Designed in a Neo-Italian Renaissance style by William B. Tuthill, the building opened in May 1891 and was eventually named for the industrialist Andrew Carnegie, its builder and original owner. Peter Ilich Tchaikovsky served as guest conductor during the hall's opening week, and since then virtually every important American and visiting musician has performed there. The hall was the longtime home of the New York Philharmonic until that orchestra moved to Lincoln Center in the 1960s.

In 1959 Carnegie Hall came close to being demolished, because the New York Philharmonic's planned move to Lincoln Center left the hall only marginally profitable. At this point the violinist Isaac Stern and the music patrons Jacob and Alice Kaplan mounted a successful campaign to save the old building, and in 1960 New York City bought the building, the money to be repaid to the city by the new nonprofit Carnegie Hall Corporation. Carnegie Hall thus continued to host concerts and other musical events, and in 1986 it underwent a major restoration.

carnelian, also called CORNELIAN, a translucent, semiprecious variety of the silica mineral chalcedony that owes its red to reddish brown colour to colloiddally dispersed hematite (iron oxide). It is a close relative of sard, differing only in the shade of red. Carnelian was highly valued and used in rings and signets by the Greeks and Romans, some of whose intaglios have retained their high polish better than many harder stones. Carnelian's colour is enhanced by baking and dyeing with iron salts. Chief localities are Ratnapura, India; Campo de Maia, Brazil; and Warwick, Queensland, Australia. Its physical properties are those of quartz. See silica mineral (table).

Carnera, Primo (b. Oct. 26, 1906, Sequals, Udine, Italy—d. June 29, 1967, Sequals), Italian heavyweight-boxing champion of the world from June 29, 1933, when he knocked out Jack Sharkey in six rounds in New York City, until June 14, 1934, when he was knocked out by Max Baer in 11 rounds, also in New York City.

Carnera began his professional boxing career in Paris in 1928 and went to the United States in 1930, compiling an impressive total of knockout victories, which many observers believed were prearranged. After two successive knockouts by Leroy Haynes in 1936, he returned to Europe practically penniless, having seen little of the purses he won in the United States. From 1928 to 1945 he had 99 bouts, winning 86, 66 by knockouts. Weighing about 260 pounds (117 kg), he was the heaviest of all world champions; his height was 6 feet 5.75 inches (197.5 cm).

In World War II he was a member of the Italian Sniper Brigade, had a losing fight in 1945, and returned to the United States as a wrestler. He won a small fortune, became a U.S. citizen, and, after retiring from wrestling, he refereed and had a small business. He appeared in several Hollywood films from 1933 to 1960.

Carnesecchi, Pietro (b. Dec. 24, 1508, Florence [Italy]—d. Oct. 1, 1567, Rome, Papal States), controversial Italian humanist and religious reformer executed because of his sympathy for and affiliation with the Protestant Reformation. He was patronized by the Medici, particularly Pope Clement VII, to whom he became principal secretary. At Naples in 1540

he joined the circle of the influential Spanish religious writer Juan de Valdés, whose distinctive Christianity was a nonsacramental, undogmatic religion that stressed the immediacy of Inner Light (*i.e.*, a divine presence to enlighten and guide the soul) yet was taught and practiced within the context of Roman Catholicism. This doctrine annoyed the Roman inquisitors. Worsening his position, Carnesecchi accepted Martin Luther's doctrine of justification by faith, though repudiating any schismatic policy.

When a movement of suppression began in 1546, Carnesecchi fled to Paris to Catherine de Médicis, queen consort of France from 1547. Refusing to appear in Rome under command of Pope Paul IV, he was condemned in 1558. He was absolved, after Paul's death, and in 1559 returned to Rome. Under Pope Pius V, however, the Inquisition renewed its activities in 1566. Carnesecchi went to Florence, only to be betrayed by his patron, Cosimo I de' Medici. He was beheaded and burned.

Carnic Alps, Italian ALPI CARNICHE, German KARNISCHE ALPEN, range of the Eastern Alps, extending along the Austrian-Italian border for 60 miles (100 km) from the Pustertal (valley) and the Piave River (west) to the Gailitz (Italian Silizza) River (east). The mountains are bounded by the Dolomites (southwest), the Gail River and the Gailtaler Alpen (north), the Karawanken (east), and the Julian Alps (southeast). The mountains rise to Kellerwand (9,121 feet [2,780 m]) and are crossed by road at Plöcken Pass (Italian Passo di Monte Croce, 4,462 feet [1,360 m]). Summer resorts and winter sports centres lie within the scenic range.

Carniola, German KRANJKA, Slovenian KRANJSKA, western region of Slovenia, which in the 19th century was a centre of Slovenian nationalist and independence activities within the Austrian Empire and Austria-Hungary. It

Carniola in the mid-19th century

was part of the Roman province of Pannonia in ancient times and was occupied by the Slovenes in the 6th century AD. Emerging as a distinct district in the 10th century, Carniola belonged to a series of ecclesiastical and lay princely houses until 1335 when it became a possession of the Austrian Habsburgs, who held it with only brief interruption until 1918.

The scene of Turkish raids and peasant revolts (15th–17th centuries) and of religious repression during the Counter-Reformation, Carniola underwent significant economic advance in the 18th and 19th centuries, particularly while it was ruled by Napoleonic France as part of the Illyrian Provinces (1809–14). Slovene nationalism also developed in Carniola in the 19th century, and during the 1848 revolutions against the Habsburgs, the inhabitants of the region tried unsuccessfully to create an autonomous Slovene kingdom

within the Austrian Empire. In 1849 Carniola was reorganized as an Austrian crown land, which was dominated by Austrian bureaucrats. Under that administration the Slovene nationalist movement grew stronger, and in 1918 most of Carniola was attached to the new Kingdom of Serbs, Croats, and Slovenes (later called Yugoslavia). After 1947 Carniola was located entirely within Slovenia.

carnitine, a water-soluble, vitamin-like compound related to the amino acids. It is an essential growth factor for mealworms and is present in striated (striped) muscle and liver tissue of higher animals. Carnitine, which can be synthesized by the higher animals, is associated with the transfer of fatty substances from the bloodstream to active sites of fatty-acid oxidation within muscle cells. It regulates the rate of oxidation of fatty acids and may afford the means by which a cell can rapidly shift its metabolic patterns (*e.g.*, from fat synthesis to fat breakdown).

carnival, the merrymaking and festivity that takes place in many Roman Catholic countries in the last days and hours of the pre-Lenten season. The derivation of the word is uncertain, though it possibly can be traced to the Medieval Latin *carnem levare* or *carnelevarium*, which means to take away or remove meat. This coincides with the fact that carnival is the final festivity before the commencement of the austere 40 days of Lent, during which Roman Catholics, in earlier times, abstained from eating meat. The historical origin of carnival is also obscure. It possibly has its roots in a primitive festival honouring the beginning of the new year and the rebirth of nature, though it is also possible that the beginnings of carnival in Italy may be linked to the pagan Saturnalian festival of ancient Rome.

The first day of the carnival season varies with both national and local traditions. Thus in Munich and Bavaria the carnival, or Fasching (*q.v.*), begins on the feast of the Epiphany (January 6), while in Cologne and the Rhineland it begins on November 11 at 11:11 AM (11th month, day, hour, and minute). In France the celebration is restricted to Tuesday before Ash Wednesday (Shrove Tuesday) and to *mi-carême*, or the Thursday of the third week of Lent. More generally the commencement date is Quinquagesima Sunday, and the termination is Shrove Tuesday; though, in some parts of Spain, Ash Wednesday also is included in the carnival celebrations, an observance that stems from a time when Ash Wednesday was not an integral part of Lent.

In earlier times, Rome was most conspicuous as the centre of carnival activity, and the splendour and richness of the festivity that marked its observance there were scarcely surpassed elsewhere. In its long history, the carnival played a significant role in the development of the popular theatre, vernacular song, and folk dances.

In the United States the principal carnival celebration is in New Orleans, where the carnival season opens on Twelfth Night (January 6) and climaxes with the Mardi Gras season commencing 10 days before Shrove Tuesday. The French name *Mardi Gras* means Fat Tuesday, from the custom of using all the fats in the home before Lent. The most famous modern carnival, however, is perhaps that of Rio de Janeiro. Masked balls, elaborate costumes, parades, and various other festivities mark such celebrations.

carnival song, Italian CANTO CARNASCIALES- CO, plural CANTI CARNASCIALESCHI, late 15th-

and early 16th-century part song performed in Florence during the carnival season. The Florentines celebrated not only the pre-Lenten revelry but also the Calendimaggio, which began on May 1 and ended with the Feast of St. John on June 24. An essential part of the festivities was the singing and dancing of secular songs by masked merry-makers. Under Lorenzo de' Medici (ruled 1469–92) the carnival celebrations became more intense and elaborate, and, as a result of his leadership and encouragement, the court also took a more active part. Lorenzo himself wrote poems to be sung by his courtiers as well as by guild members, the former performing songs based on stories taken from mythology and the latter basing their repertoire on subjects of a more current and popular appeal.

Textually, the *canti carnascialeschi* descend from the old *cacce*, which were also topical, descriptive, and full of double meanings. Often, these are satirical or obscene in character, and the titles of the songs themselves effectively portray the vigour and excitement of life in 15th-century Florence. Musically, the pieces are chordal and strophic, in a style similar to the Mantuan *frottole*, this form probably emanating from the outdoor and public nature of the performances. (They included serenades, chariot songs, and processions, for example.) In many instances, the music is in an ABBC form, with the 4 metre changing to 3 on the C section; this is then repeated for a number of stanzas. A number of carnival songs were written by Heinrich Isaac during his stay at Lorenzo's court (c. 1480), but, unfortunately, they have been lost.

The fall of the Medici (1494) and the rule of Savonarola strongly affected the carnival songs, many of which disappeared along with art treasures and musical instruments. Some of the better known melodies survived, however, newly adorned with sacred and penitential texts. After the fall of Savonarola in 1498, the carnival was reinstated, but it never regained its original colourfulness and air of joyful gaiety. Instead, it became a sombre and dignified court ceremonial, and, as a result, the *canti carnascialeschi* lost their popular spontaneity and grew more literary in nature.

carnivore, a member of the mammalian order Carnivora, literally "meat eaters." The order Carnivora is composed of 10 families of primarily predatory mammals: the dogs, foxes, wolves, and jackals (Canidae); bears (Ursidae); raccoons and pandas (Procyonidae); weasels, skunks, otters, and badgers (Mustelidae); genets, civets, and mongooses (Viverridae); hyenas (Hyaenidae); cats (Felidae); sea lions, or eared seals (Otariidae); earless seals (Phocidae); and the walrus (Odobenidae). Although the term carnivore can be applied broadly to any meat-eating animal, including mammals in other orders such as the otter shrews (Insectivora) and the Tasmanian devil (Marsupialia), mammalogists generally use the term in this more restricted sense. Most members of the order are in fact meat eaters, although some ursids, procyonids, and canids rely heavily on vegetation, and the giant panda (*Ailuropoda melanoleuca*) lives almost entirely on bamboo shoots.

A brief treatment of carnivores follows. For full treatment, see MACROPAEDIA: Mammals.

Marine carnivores (the three families of pinnipeds, or seal-like forms) are found in all oceanic waters and along the coasts of all the continents. Terrestrial carnivores are native to all continents but Antarctica and Australia, although the dingo (*Canis dingo*) was introduced to the latter during the early Aboriginal invasion. The smallest carnivore, the least weasel (*Mustela nivalis*), weighs only 30 to 70 grams (1 to 2.5 ounces), while the largest ter-

restrial species, the Alaskan brown bear (*Ursus arctos*), can reach 780 kilograms (1,700 pounds). The largest member of the order is the elephant seal (*Mirounga leonina*) at 3,600 kilograms (4 tons). Carnivores exhibit a wide variety of forms. The pinnipeds have evolved paddle-like extremities; the limbs are enclosed within the streamlined torso down to at least the elbows or knees, and the remaining portion of the limb is flattened as a flipper that provides efficient aquatic propulsion. Among the terrestrial carnivores, body forms may be adapted for running (many canids), stalking (felids), climbing (many viverrids), and swimming (otters).

Most carnivores have a fairly complex dentition; incisors, canines, premolars, and molars occur in that order. In those members of the order that live mainly on meat, some of the side teeth have evolved into the scissor-like carnassials, or shearing teeth. The teeth behind the carnassials are usually absent. In carnivores the incisor teeth usually function for nipping, and the large sharp canines are used to grab and hold the prey. The more omnivorous ursids and procyonids lack carnassials and have retained more of their molar teeth for grinding their food. Pinnipeds show less variety in tooth structure than other carnivores, their premolars and molars all being essentially conical structures that are efficient for grabbing and holding fish.

The lower jaw of carnivores is hinged in such a way that it can move only vertically, but it can exert great power. Collarbones are absent or reduced, which allows great flexibility in the shoulder area. The brains of carnivores are relatively large for their body weights and, characteristic of the more intelligent animals, are highly convoluted. The stomach is simple and the intestine short, both typical features of carnivorous animals, as animal tissue is easier to digest than vegetable tissue.

The earliest carnivores, the Miacidae, appeared during Paleocene times (about 60,000,000 years ago). The group probably evolved from an insectivorous ancestor. By late Eocene times two distinct lines were apparent within the Carnivora; the Feloidea (which led to the cats, viverrids, and hyenas) and the Canoidea (dogs, mustelids, bears, and procyonids). Among the feloids, the viverrids are so similar to the ancestral miacids that some mammalogists place both in the family Viverridae. The two main characteristics distinguishing these lines are the presence of retractile or semi-retractile claws in most feloids and a difference in the structure of the tympanic bulla, which in feloids is composed of an external tympanic bone and an internal endotympanic bone and in canoids is composed of only the tympanic bone.

The populations of various carnivores are limited by the availability of prey. Most carnivores space themselves out by establishing and maintaining territories. The size of these territories depends on the size of the predator and the carrying capacity of the prey population; a mountain lion (*Felis concolor*) needs a large territory to support the deer herds it preys on, while a bobcat (*F. rufus*) can usually support itself on the rabbit population of a much smaller area.

Hunting patterns differ throughout the Carnivora. Most canids have great endurance and are built to run down their prey. The cats, on the other hand, tire quickly and are adapted to stalking and leaping upon their prey. When their hooked claws are extended the foot also expands; this gives them a large surface with which to grasp and hold the prey. Although they are the largest land carnivores, the bears live mainly on insects, seeds, nuts, plant matter, and berries; some species also fish. Only the polar bear (*Thalartos maritimus*) is mostly predatory; its Arctic environment has little vegetation, and this highly aquatic bear lives mainly on seals. The sea otter (*Enhydra*)

is among the tool-using mammals. Its diet consists of abalone and other shellfish, which it opens by cracking them on a rock held on its chest as it floats on its back.

Some carnivores are quite solitary (most of the cats, civets, bears, and weasels); others live and hunt in pairs or with the young of the year (foxes and the kinkajou, *Potos flavus*). Some, including the wolves, Cape hunting dogs (*Lycyon pictus*), lions (*Panthera leo*), coatimundi (*Nasua*), and some mongooses, live and hunt in large social groups. Pinnipeds live in huge rookeries during the breeding season; in many species the males establish breeding territories and maintain harems.

Mating patterns vary from the temporary liaisons seen in the bears and most cats to the monogamous pairs found in many species of canids. Delayed implantation (in which the embryo floats freely in the womb for up to several months before embedding in the uterine wall and commencing development) is found in many mustelids and the bears. Litter size is generally between 3 and 6; bears usually have only 2 cubs, while the Asiatic polecat (*Mustela eversmanni*) may produce up to 18 young. Young carnivores are cared for by one or both parents, depending on the species, and in some, such as the Cape hunting dog, the entire pack feeds and guards the pups once they stop nursing. Young carnivores remain with the adults until they have learned basic hunting skills. Many carnivores will bring wounded game back to their young so they can practice catching and killing. Small carnivores, such as mustelids, may be mature and breeding at one year of age, but the larger ones, such as bears, do not mature until three or four. Male pinnipeds may be much older than that before they can compete with the dominant males for a chance to breed.

carnivorous plant, also called INSECTIVOROUS PLANT, any plant especially adapted for capturing insects and other tiny animals by means of ingenious pitfalls and traps and then digesting them to the decomposing action of digestive enzymes, bacteria, or both. The approximately 400 known species of carnivorous

Open and closed leaf traps of Venus's-flytrap (*Dionaea muscipula*)
Rutherford Platt

plants constitute a very diverse group, in some cases having little more in common than their carnivorous habit. Although the carnivorous adaptation is most widespread and conspicuous among green plants, some microscopic species of fungi also catch and digest animal prey.

Carnivorous plants digest their prey through a process of chemical breakdown analogous to digestion in animals. The end products, particularly nitrogenous compounds and salts, are absorbed by the plants. Their adaptations for digesting nitrogen-rich animal proteins are thought to enable these plants to survive under otherwise marginal or hostile environmental conditions. Most carnivorous species are green plants that manufacture food by photosynthesis from the raw materials of sunlight, water, and carbon dioxide in the presence of chlorophyll. The carnivorous habit augments the diet derived from their environment.

The conspicuous trapping mechanism, which is always a leaf modification, draws special attention to these plants. Classification is based primarily on the floral characteristics, as among flowering plants in general. More than half of the species belong to the family Lentibulariaceae (order Scrophulariales), marked by bilaterally symmetrical flowers with fused petals. The remainder of the species belong to several families characterized by radially symmetrical flowers formed of separate petals. The families of the latter group are the Droseraceae and Nepenthaceae, which constitute the order Nepentales; and the family Sarraceniaceae (order Sarraceniales). The species of Nepenthaceae and Sarraceniaceae, known collectively as pitcher plants, capture prey by means of pitfalls; members of the Droseraceae (sundews, flytraps) have active trapping devices.

The family Droseraceae comprises four genera (*Aldrovanda*, *Dionaea*, *Drosera*, and *Drosophyllum*) and about 100 species, nearly all of which belong to the genus *Drosera*, of the sundew family (*q.v.*). *Aldrovanda* are floating aquatics sometimes grown in aquaria as curiosities. *Dionaea*, represented by a single species, *D. muscipula*, is the well-known, quick-acting flytrap (see Venus's-flytrap). *Drosophyllum*, also with a single species, *D. lusitanicum*, is the yellow, or Portuguese, sundew.

The species of New World pitcher plants are placed in the family Sarraceniaceae. Eight of the 15 species belong to the widely known and much studied genus *Sarracenia*, of eastern North and South America. The approximately 70 species of Old World pitcher plants constitute the only genus of the family Nepenthaceae, *Nepenthes*. *Cephalotus follicularis*, of southwestern Australia, looks like a saxifrage with small *Sarracenia* leaves; it constitutes a pitcher-plant family of its own, Cephalotaceae (order Saxifragales). (See pitcher plant.)

The family Lentibulariaceae includes about five carnivorous genera and more than 250 species. The majority of them belong to the genus *Utricularia*, the bladderworts, the most cosmopolitan of all the carnivorous genera. The two small genera *Biovularia* (two species; Cuba, South America) and *Polypompholyx* (two species; Australia) are very similar to *Utricularia* and also trap their prey by means of highly specialized bladders. *Genlisea* is a small tropical genus of 15 species of tiny aquatic plants that trap their prey by means of tiny pitcherlike structures. The butterworts, 45 species in the genus *Pinguicula*, differ from the bladderworts and other genera, trapping their prey by a third method—on sticky flypaper-like leaves. (See bladderwort.)

Whether aquatic, terrestrial, or amphibious, carnivorous plants have a basically similar ecology. Species of two or three genera (*e.g.*, *Sarracenia*, *Drosera*, *Pinguicula*) are often found growing almost side by side. The majority are most likely to be found in damp heaths, bogs, swamps, and muddy or sandy shores where water is abundant and where nitrogenous materials are often scarce or unavailable because of acid or other unfavourable soil conditions. *Drosophyllum lusitanicum* seems to be the one exception; it grows on dry, gravelly hills of Portugal and Morocco.

On the whole, carnivorous plants are relatively small, but size variation is enormous even within the same genus. The majority are herbaceous perennials less than 30 cm (1 foot) high, often only 10 to 15 cm (4 to 6 inches). Some species of *Nepenthes*, however, become large shrubby vines. *Drosera* species vary from a few centimetres to 1 m (3 feet) or more in height (*D. gigantea*); the smallest are often hidden among the moss of a sphagnum bog.

carnosaur, any of the large carnivorous dinosaurs belonging to the infraorder Carnosauria (suborder Theropoda). The carnosaurs

were a branch of theropod dinosaurs that evolved into predators of large herbivorous dinosaurs. The carnosaurs were thus in contrast with the theropod dinosaurs known as coelurosaurs, which were smaller, lightly built, swift-running predators. The carnosaurs are believed to have diverged from the coelurosaur line in the Late Triassic Period (230 to 208 million years ago), and they had become the main predators of large animals by the Early Jurassic (208 to 187 million years ago). Carnosaurs were massively built bipeds with short necks, large skulls, and wide, gaping mouths equipped with formidable teeth. The earlier forms are typified by *Megalosaurus*, which was 9 m (30 feet) long and lived during the Jurassic. The carnosaurs developed progressively larger forms, and the *Allosaurus* of the Late Jurassic, at 12 m in length, eventually gave way to *Tyrannosaurus* of the Late Cretaceous Period (97.5 to 66.4 million years ago). *Tyrannosaurus* was the largest of all carnosaurs, reaching lengths of 15 m, and was the largest terrestrial carnivore ever known. The carnosaurs became extinct at the end of the Cretaceous.

Carnot, Lazare, in full LAZARE-NICOLAS-MARGUERITE CARNOT, byname ORGANIZER OF VICTORY, OF THE GREAT CARNOT, French ORGANISATEUR DE LA VICTOIRE, OF LE GRAND CARNOT (b. May 13, 1753, Nolay, Burgundy, Fr.—d. Aug. 2, 1823, Magdeburg, Prussian Saxony [Germany]), French statesman, general, military engineer, and administrator in successive governments of the French Revolution. As a leading member of the committees of General Defense and Public Safety and of the Directory (1793–97), he helped mobilize the Revolutionary armed forces and matériel.

Education and training. The son of a lawyer, Carnot studied at the Collège d'Autun and subsequently at the small seminary in the same town. After attending the artillery and engineering preparatory school in Paris from 1769 to 1771, he was graduated from the Mézières school of engineering, in January 1773, with the rank of lieutenant. In 1780 he was admitted to a literary society and in 1784 became known for an eulogy of Sébastien Le Prestre de Vauban, the French military engineer, which received an award from the Dijon Academy. In 1787 he was elected a member of the Arras Academy, the director of which at that time was Robespierre, who was to be a leading figure in the Revolution.

When the Revolution broke out in 1789, Carnot was still a captain, a rank he had received in 1784. In 1791 he was elected deputy from Pas-de-Calais to the Legislative Assembly. As a member of the diplomatic and public education committees, Carnot did not distinguish himself; but on Aug. 11, 1792, the day after the attack on the royal palace of the Tuileries in Paris, he was sent to the Army of the Rhine to report what had occurred.

Lazare Carnot, lithograph by Ambroise Tardieu, after an engraving by C.A. Forestier

By courtesy of the Bibliothèque Nationale, Paris

In September 1792 Carnot was elected representative from Pas-de-Calais to the National Convention—the assembly elected under the influence of the fall of the monarchy—and at the end of the month was sent, with two other representatives, on a mission to Bayonne to organize the defense against a possible attack from Spain.

Since he was absent from Paris until the beginning of January 1793, Carnot did not take part in debates accompanying Louis XVI's trial. He did, however, take part in the decisive votes, in which he voted against an appeal to the people and in favour of the king's death. He thus indicated that he had been won over to the position of the Jacobins—the radicals—even though by temperament and inclination he was a man of the independents of the centre.

As a member of the Committee of War, Carnot was assigned to the Committee for General Defense, a predecessor of the Committee of Public Safety, which was to act as the executive branch throughout the republic. In this capacity Carnot presented various reports to the Convention, particularly one on March 9, 1793, which resulted in the dispatch of 82 representatives into the provincial *départements* to expedite the conscription of 300,000 men. Carnot himself was sent into the *départements* of the Nord and of Pas-de-Calais and at the end of March to the Army of the North. He remained with the Army of the North until August 1793, establishing his mastery in military operations as well as in the command of men. He reorganized the army, reestablished discipline, and took part, musket in hand, in the attack and capture of Furnes.

Political rise and fall. On Aug. 14, 1793, the Convention appointed Carnot a member of the Committee of Public Safety. Shortly after, he set out again for the Army of the North, while the enemy besieged Maubeuge. This mission ended in the victory of Wattignies on Oct. 16, 1793, and in the raising of the siege of Maubeuge. Once again Carnot, at the side of the generals, led the attack and entered the recaptured town alongside them. At the end of the month, he resumed his seat on the Committee of Public Safety.

From then on, Carnot devoted himself to the immense task of the Committee, concentrating on the conduct of military operations, although he did not entirely divorce himself from general policy. From the very start Carnot demanded that the ancient tactic of line combat be abandoned, advocating instead attack by masses concentrated at decisive points; eventually his views were adopted by the entire Committee. Carnot took a dominant part in the development of campaign plans, which were discussed by the entire Committee; Robespierre and Louis de Saint-Just, one of Robespierre's chief aides, concerned themselves particularly with strategy.

Beginning in May 1794, dissensions arose within the Committee of Public Safety between Carnot and Robespierre and Saint-Just, all of whom were of equally authoritarian and unyielding temperament. Carnot, basically a conservative, did not approve of the egalitarian aims of the social policy of Robespierre and his followers. If he did not play a decisive role during the coup of 9 Thermidor, year II (July 27, 1794), which overthrew Robespierre and marked the end of the Reign of Terror, Carnot must at least have approved of the fall of Robespierre.

Subsequently, however, Carnot's role began to diminish. He continued to occupy himself with directing military operations for another few months, but he soon had to defend himself against attacks by the executors of the Thermidorian coup, aimed without distinction

against all former members of the Committee of Public Safety. Thus, in March 1795, in an attempt to dissociate himself from his former colleagues, he claimed that each of them was responsible only for the duty with which he was charged and that the signatures to decrees regarded as reprehensible were only a formality. Yet Carnot did not succeed in silencing the charges. In May 1795, when an obscure deputy demanded the arrest of all the members of the former committees and named Carnot, he was saved by another deputy who shouted "He organized the victory."

Carnot was elected to the Directory, the French government from 1795 to 1799, the executive branch of which consisted of five directors; and he became even more conservative than before. When the elections of the spring of 1797 brought in a royalist majority, Carnot bowed to the results, so that during the coup d'état of 18 Fructidor, year V (Sept. 4, 1797), which quashed the elections, he had to flee in order to escape arrest. He crossed into Germany and settled in Nürnberg.

After the coup d'état of 18 Brumaire, year VII (Nov. 9, 1799), which brought Napoleon Bonaparte to power as first consul of France, Carnot returned. He was minister of war for a few months in 1800 but resigned. Appointed in 1802 a member of the Tribunat, a body chosen by the Senate to debate legislation, he fought the authoritarian development of the consular regime, opposed the institution of the Legion of Honour, voted against bestowing on Napoleon the consulate for life, and courageously opposed the establishment of the empire under Napoleon. He continued, however, to hold a seat on the Tribunat until that assembly was suppressed in 1807, when he withdrew from public life.

The allied invasion of 1814 forced him out of retirement. Napoleon appointed him governor of the town of Antwerp, where he remained until after the fall of the empire. Carnot sided with the Restoration under Louis XVIII, but in July 1814 he published his *Mémoire au roi en juillet 1814*, in which he denounced the excesses of the reaction under the Bourbon king. During the Hundred Days, when Napoleon attempted to reestablish his power, Carnot served as minister of the interior, and, after Napoleon's defeat at Waterloo, Carnot encouraged him to resist, but in vain. The Second Restoration marked the end of Carnot's political career.

In July 1815 Carnot was exiled from France. He left Paris in October and settled at Warsaw in January 1816. In August 1816 Carnot left Warsaw for Magdeburg, where he died seven years later.

The Third Republic, eager to acquire ancestors, exalted Carnot's memory, consecrating him as "the Organizer of Victory." When his grandson, Sadi Carnot, nephew of the scientist Sadi Carnot, was president of the republic, the ashes of Lazare Carnot were placed in the Panthéon in Paris. Carnot was indeed "the Organizer of Victory" but only in collaboration with the other members of the Committee of Public Safety, with whom he shared responsibility for the Terror as well. For although the Committee of Public Safety was able to raise, equip, arm, and feed 14 armies and lead them to victory, it succeeded only by means of a mass levy, mass requisitions, and nationalization of military production—measures that were based on the revolutionary government's use of force, that is, an authority relying on the Terror. The characterization of Lazare Carnot as "the Organizer of Victory" is a legend created by the victors of the Thermidor coup, who, holding those vanquished in the coup responsible for the Terror, surrounded the survivors with all the brilliance of the victory. (A.I.S.)

BIBLIOGRAPHY. Huntley Dupre, *Lazare Carnot, Republican Patriot* (1940, reprinted 1975), is a biography. Charles Coulston Gillispie, *Lazare Carnot Savant* (1971), describes Carnot's scientific work.

Carnot, Sadi, in full NICOLAS-LÉONARD-SADI CARNOT (b. June 1, 1796, Paris, Fr.—d. Aug. 24, 1832, Paris), French scientist who described the Carnot cycle, relating to the theory of heat engines.

Carnot was the eldest son of the French Revolutionary figure Lazare Carnot and was named for a medieval Persian poet and philosopher, Sa'di of Shiráz. His early years were a period of unrest, and the family suffered many changes of fortune. His father fled into exile soon after Sadi's birth; in 1799 he returned to be appointed Napoleon's minister of war but was soon forced to resign. A writer on mathematics and mechanics as well as military and political matters, the elder Carnot now had the leisure to direct his son's early education.

Sadi Carnot, engraving after a painting by A. Bailly, 1813

By courtesy of the Bibliothèque Nationale, Paris

Sadi entered the École Polytechnique in 1812, an institution providing an exceptionally fine education, with a faculty of famous scientists aware of the latest developments in physics and chemistry, which they based on a rigorous mathematics. By the time Sadi graduated in 1814, Napoleon's empire was being rolled back, and European armies were invading France. Soon Paris itself was besieged, and the students, Sadi among them, fought a skirmish on the outskirts of the city.

During Napoleon's brief return to power in 1815, Lazare Carnot was minister of the interior, but, following the emperor's final abdication, he fled to Germany, never to return to France.

Sadi remained an army officer for most of his life, despite disputes about his seniority, denial of promotion, and the refusal to employ him in the job for which he had been trained. In 1819 he transferred to the recently formed General Staff but quickly retired on half pay, living in Paris on call for army duty. Friends described him as reserved, almost taciturn, but insatiably curious about science and technical processes.

The mature, creative period of his life now began. Sadi attended public lectures on physics and chemistry provided for workingmen. He was also inspired by long discussions with the prominent physicist and successful industrialist Nicolas Clément-Desormes, whose theories he further clarified by his insight and ability to generalize.

The problem occupying Carnot was how to design good steam engines. Steam power already had many uses—draining water from mines, excavating ports and rivers, forging iron, grinding grain, and spinning and weaving cloth—but it was inefficient. The import into France of advanced engines after the war with Britain showed Carnot how far French design had fallen behind. It irked him particularly

that the British had progressed so far through the genius of a few engineers who lacked formal scientific education. British engineers had also accumulated and published reliable data about the efficiency of many types of engines under actual running conditions; and they vigorously argued the merits of low- and high-pressure engines and of single-cylinder and multicylinder engines.

Convinced that France's inadequate utilization of steam was a factor in its downfall, Carnot began to write a nontechnical work on the efficiency of steam engines. Other workers before him had examined the question of improving the efficiency of steam engines by comparing the expansion and compression of steam with the production of work and consumption of fuel. In his essay, *Réflexions sur la puissance motrice du feu et sur les machines propres à développer cette puissance* (*Reflections on the Motive Power of Fire*), published in 1824, Carnot tackled the essence of the process, not concerning himself as others had done with its mechanical details.

He saw that, in a steam engine, motive power is produced when heat "drops" from the higher temperature of the boiler to the lower temperature of the condenser, just as water, when falling, provides power in a water-wheel. He worked within the framework of the caloric theory of heat, assuming that heat was a gas that could be neither created nor destroyed. Though the assumption was incorrect and Carnot himself had doubts about it even while he was writing, many of his results were nevertheless true, notably the prediction that the efficiency of an idealized engine depends only on the temperature of its hottest and coldest parts and not on the substance (steam or any other fluid) that drives the mechanism.

Although formally presented to the Academy of Sciences and given an excellent review in the press, the work was completely ignored until 1834, when Émile Clapeyron, a railroad engineer, quoted and extended Carnot's results. Several factors might account for this delay in recognition; the number of copies printed was limited and the dissemination of scientific literature was slow, and such a work was hardly expected to come from France when the leadership in steam technology had been centered in England for a century. Eventually Carnot's views were incorporated by the thermodynamic theory as it was developed by Rudolf Clausius in Germany (1850) and William Thomson (later Lord Kelvin) in Britain (1851).

Little is known of Carnot's subsequent activities. In 1828 he described himself as a "constructor of steam engines, in Paris." When the Revolution of 1830 in France seemed to promise a more liberal regime, there was a suggestion that Carnot be given a government position, but nothing came of it. He was also interested in improving public education. When absolutist monarchy was restored, he returned to scientific work, which he continued until his death in the cholera epidemic of 1832 in Paris. (E.M.)

BIBLIOGRAPHY. An edition of Carnot's *Reflections*, trans. by R.H. Thurston (1890, reprinted in part 1943), includes a brief biography by his brother, Hippolyte Carnot, and a short essay by the translator on Carnot's work.

Carnot, Sadi, in full MARIE-FRANÇOIS-SADI CARNOT (b. Aug. 11, 1837, Limoges, Fr.—d. June 24, 1894, Lyon), an engineer turned statesman who served as fourth president (1887–94) of the Third Republic until he was assassinated by an Italian anarchist.

The son of a leftist deputy (Hippolyte Carnot) who was a vigorous opponent of the July Monarchy (after 1830), and grandson of Lazare Carnot, the famous "Organizer of Victory" of the French Revolution, he was educated as an engineer at the École Polytechnique and then the École des Ponts et Chaussées.

Sadi Carnot

sées (School of Bridges and Highways). After service as a government engineer at Annecy, he was named commissioner of Normandy with responsibility for organizing resistance there in the Franco-German War (1870–71). After a brief term as prefect of Seine-Inférieure he was elected to the Chamber of Deputies from the Côte d'Or *département*. Sitting with the Left Republicans, Carnot concentrated on issues concerning public works and railroad development.

In October 1878 he was appointed undersecretary of public works, and in 1880 he took charge as minister. Elected vice president of the Chamber in April 1885, he served as minister of commerce and finance. In 1887 he was elected president of the republic without actively aspiring to the office.

The Carnot presidency was marked by the plots of the political adventurer Gen. Georges Boulanger, labour agitation, anarchist movements, and the Panama Canal scandals (1892). Yet he managed to retain his popularity through 10 different governments formed in the course of seven years. After delivering a speech at a Lyon exposition, he was fatally wounded by the Italian anarchist Sante Caserio. He was buried in the Panthéon next to his illustrious grandfather.

Carnot cycle, in heat engines, ideal cyclical sequence of changes of pressures and temperatures of a fluid, such as a gas used in an engine, conceived early in the 19th century by the French engineer Sadi Carnot. It is used as a standard of performance of all heat engines operating between a high and a low temperature.

In the cycle the working substance of the engine undergoes four successive changes: expansion by heating at a constant high temperature; reversible adiabatic expansion; compression by cooling at a constant low temperature; and reversible adiabatic compression. The engine receives heat (from the heat source) during the expansion at high temperature, delivers work during the reversible adiabatic expansion, rejects heat (to the heat sink) during the compression at low temperature, and receives work during the reversible adiabatic compression. The ratio of the net work output to the heat input is equal to the ratio of the difference between the temperatures of the heat source and the heat sink divided by the temperature of the heat source. It represents Carnot's principle in that it is the largest such ratio of any engine operating between the two temperatures.

carnotite, radioactive, bright-yellow, soft and earthy vanadium mineral that is an important source of uranium. A hydrated potassium uranyl vanadate, $K_2(UO_2)_2(VO_4)_2 \cdot nH_2O$, pure carnotite contains about 53 percent uranium, 12 percent vanadium, and trace amounts of radium. It is of secondary origin, having been formed by alteration of primary uranium-vanadium minerals. It occurs chiefly with tyuyamunite (its calcium analogue) in sandstone, either disseminated or locally as small pure masses, particularly around fossil wood.

Carnotite has provided most of the uranium production from secondary deposits; it is also mined for vanadium and radium. From 1911 to 1923, ores containing carnotite were mined in Colorado for radium. From 1937 to 1943, carnotite was again mined, primarily for vanadium. After World War II it was mined extensively in the U.S. for uranium. The greatest known concentration of carnotite deposits is in the western U.S., particularly in the Colorado Plateau area. Other deposits occur in Wyoming, South Dakota, and Pennsylvania. Carnotite has been found in small quantities at many localities throughout the world; commercial deposits outside the U.S. occur near Kokand and Ferghana in eastern Uzbekistan.

Carnotite found near Green River, Utah

For detailed physical properties, see vanadate mineral (table).

Carnuntum, the most important ancient Roman legionary camp of the upper Danube frontier, situated at Petronell, 20 miles east of Vienna. It was the emperor Tiberius' base in his attacks on the Marcomanni (AD 6), after which a fort for one legion was erected, although it was replaced about AD 73 by a stone camp.

In AD 106 it became the capital of the province of Upper Pannonia. Here the emperor Marcus Aurelius wrote the second book of his *Meditations* during his campaign against the Marcomanni (171–173). The Conference of the Emperor was held here in 307. After its destruction by barbarians in the Marcomannic Wars, the camp was rebuilt in 375 but was finally destroyed by fire about 400.

Caro, Annibale (b. June 19, 1507, Civitanova Marche, Papal States—d. Nov. 21, 1566, Rome), Roman lyric poet, satirist, and translator, remembered chiefly for his translation of Virgil's *Aeneid* and for the elegant style of his letters.

Secretary first to Msgr. Giovanni Gaddi in Florence and in Rome, then to Cardinal Pier Luigi Farnese, Caro received benefices that freed him to write. His poetry, collected as *Rime* in 1569, and his satires are unimportant.

Caro's most outstanding works are his free and graceful *Lettere familiare* (pub. 1572–74; "Familiar Letters") and a smooth translation of Virgil's *Aeneid* (1581). He also wrote one of the most original comedies of his time, *Straccioni* (completed 1544), and a version of Longus' *Daphnis and Chloe* called *Amori pastorali di Dafni e Cloe* ("The Pastoral Loves of Daphnis and Chloe").

Caro, Anthony (Alfred) (b. March 8, 1924, London), English sculptor of abstract, loosely geometrical metal constructions.

After service in the Fleet Air Army of the Royal Navy during World War II, Caro studied engineering at Christ's College, Cambridge. In 1946 he began to study sculpture, first at Regent Street Polytechnic, London, and later at the Royal Academy Schools (1947–52).

Also during this period, he assisted the sculptor Henry Moore in his studio. Caro taught at St. Martin's School of Art in London (1953–79).

His student sculpture was primarily figurative, but in the late 1950s he began experimenting with the welded beams, rods, and planes that became his hallmark. On a visit to the U.S. in 1959 Caro met the sculptor David Smith, and the two formed a mutually influential relationship. Much of Caro's mature technique followed Smith's example.

Though some of his work adheres to a rigid, rational geometry (e.g. "Sailing Tonight," 1971–74), the characteristic Caro suggests lyrical movement, improvisation, and chance; his "Ledge Piece" (1978), commissioned for the East Building of the National Gallery of Art, Washington, D.C., seems to spill over its high perch from the pull of gravity. A catalogue raisonnée of his work by Dieter Blume was published in 1979 (rev., 1981).

Caro, Joseph ben Ephraim: see Karo, Joseph ben Ephraim.

carob (*Ceratonia siliqua*), tree of the pea family (Fabaceae), native to the eastern Mediterranean region and cultivated elsewhere. It is sometimes known as locust, or St. John's bread, in the belief that the "locusts" on which John the Baptist fed were carob pods. The tree, about 15 metres (50 feet) tall, has pinnately compound (feather-formed), glossy

Carob (*Ceratonia siliqua*)

A J Huxley—EB Inc

evergreen leaves with thick leaflets. It has red flowers followed by flat, leathery pods 7.5–30 centimetres (3–12 inches) long. The pods contain 5 to 15 hard brown seeds embedded in a sweet, edible pulp.

Carobert of ANJOU (king of Hungary): see Charles I under Charles (Hungary).

Carol (Romanian personal name): see under Charles, except as below.

Carol I, original name KARL EITEL FRIEDRICH, PRINZ VON HOHENZOLLERN-SIGMARINGEN (b. April 20, 1839, Sigmaringen, Hohenzollern-Sigmaringen—d. Oct. 10, 1914, Sinaia, Rom.), first king of Romania, whose long reign (as prince, 1866–81, and as king, 1881–1914) brought notable military and economic development along Western lines but signally failed to confront the basic problems of an overwhelmingly rural nation.

Originally the German prince Karl of Hohenzollern-Sigmaringen, Carol was educated at Dresden and Bonn and in 1864 served as an officer of the Prussian Army in the war against Denmark. With the tacit approval of his cousin, the French emperor Napoleon III, he was offered the throne of Romania after the deposition of the reigning prince, Alexan-

dru Cuza (February 1866), and in April 1866 was elected prince by plebiscite. In 1869 he married the princess Elizabeth of Wied, who later gained fame as the poetess Carmen Sylva. His Germanophile sentiments caused him to be domestically unpopular during the Franco-Prussian War (1870–71), and in 1871 a local revolution almost forced his abdication; but he regained popular support for his military leadership at the Battle of Plevna during the Russo-Turkish War (1877–78), and, with Romania's complete independence from the Ottoman Empire, he was finally crowned king (May 1881). In 1883 he concluded an alliance with Germany and Austria-Hungary, which remained a closely guarded state secret until the outbreak of World War I. He fostered the development of urban industrial and financial interests with a large measure of success and significantly built the national military establishment; but his neglect of festering rural problems—especially peasant land hunger—found its issue in the bloody peasant rebellion of 1907, which claimed perhaps 10,000 lives. His rule brought a great measure of dignity and stability to the administration of government, but his opportunistic manipulation of political parties also perpetuated some of the worst features of Romanian public life.

Carol II (b. Oct. 15, 1893, Sinaia, Rom.—d. April 4, 1953, Estoril, Port.), king of Romania (1930–40), whose controversial reign ultimately gave rise to a personal, corporatist dictatorship.

Carol II
Camera Press

The eldest son of King Ferdinand I, Carol became crown prince upon the death of his great uncle, King Carol I (October 1914). His domestic life was a constant source of scandal, marked as it was by amorganatic marriage with an officer's daughter, Zizi Lambrino; a second unhappy marriage to Helen, daughter of King Constantine I of Greece; and a continuing liaison with a Jewish adventuress, Magda Lupescu—an affair that finally obliged him to renounce his rights to the throne and go into exile (1925).

Although he was officially excluded from the Romanian succession by an act of January 1926, as well as by his father's will, he returned in 1930 and replaced the regency that had governed for his young son Michael, taking the royal oath on June 8, 1930. Flamboyant and energetic, an admirer of the authoritarian methods of the Italian dictator Benito Mussolini, he gradually undermined the already uncertain bases of Romanian democracy; and in February 1938, to counter the growing political menace of the chief national Fascist group, the Iron Guard, he proclaimed a corporatist dictatorship. In December 1938, to supplant the then disbanded political parties and provide a program of social reform, he established the Front of National Rebirth (Frontul Renașterii Naționale) with himself as head. After Romania was divested of territory in Transylvania, Dobrogea, Bukovina,

and Bessarabia by the Axis powers and the Soviet Union during World War II, he was forced to abdicate (Sept. 6, 1940) in favour of his son Michael and once again seek exile. He married Lupescu in July 1947.

carol, broadly, a song, characteristically of religious joy, associated with a given season, especially Christmas; more strictly, a late medieval English song on any subject, in which uniform stanzas, or verses (V), alternate with a refrain, or burden (B), in the pattern B, V₁, B, V₂ . . . B. The medieval words *carol* and *carole* (French and Anglo-Norman) might mean a popular dance song with pagan associations, a courtly dance or dance song, a song of popular piety, a polyphonic (multipart) song in a certain style, and a popular religious procession.

During the golden age of the English carol (c. 1350–1550), most carols could be defined by the burden-verse form. In addition, the carol seems to have crystallized in the early 14th century essentially as a popular religious song.

A handful of carol tunes and about 500 texts survive from the period. Most refer to the Virgin Mary, the Christ child, or the saints whose feasts follow Christmas; there are also a few Passiontide or Easter carols, songs with texts of moral counsel, and a few amorous, satirical, and topical texts. The versification shows skill, ingenuity, and assurance. Many carols are macaronic, mixing two languages, usually in Latin and English.

During the 15th century, the carol continued as a popular religious song, but it also developed as art music and as a literary form. Musically, it is the most important English *forme fixe* ("fixed form"), comparable to the French rondeau, virelai, and ballade. The 15th-century carol repertory is one of the most substantial monuments of English medieval music. The musical form is often elaborated—a burden for two soloists is followed by another for three-part chorus, and the two-voice verse may be punctuated by a choral refrain. The early carols are rhythmically straightforward, in modern $\frac{3}{4}$ time; later the basic rhythm is in $\frac{3}{4}$, with many cross-rhythms ($\frac{3}{8}$ and $\frac{3}{2}$), with the words subordinated to the music. The upper part or parts are more elaborate than the tenor, the bottom part, which usually seems to carry the tune, as in the famous Agincourt carol "Deo gratias Anglia." As in other music of the period, the emphasis is not on harmony, but on melody and rhythm.

At the end of the 15th century, carols appeared in a court songbook, the *Fayrfax Manuscript*, written for three or four voices in a flexible, sophisticated style based on duple (two-beat) rhythm. They are mostly on themes

connected with the Passion of Christ, and the words often decisively determine the musical effect. Composers are often mentioned—William Cornyshe, Robert Fayrfax, and John Browne. From a decade or two later survive the only examples of court carols—light songs, apparently of popular origin, in simple versions by court composers, e.g., Henry VIII's "Green groweth the holly." The polyphonic carol was written by professional musicians for trained choirs.

The carol disappeared swiftly and almost completely with the Reformation. It was largely supplanted by the metrical psalm.

A carol revival began in the second half of the 18th century. The best Christmas hymns of the era, e.g., Charles Wesley's "Hark, the herald angels sing," still lack the distinctive carol touch. The revival built on collections of traditional broadsides, which included "The first Nowell," and "A Virgin Most Pure." Two other sources were the English folk carol ("I saw three ships") and translated foreign carols ("Patapan," a French *noël*).

Carol, Martine, original name MARIE-LOUISE-JEANNE MOURER (b. May 16, 1922, Biarritz, Fr.—d. Feb. 16, 1967, Monte-Carlo), French film actress, the reigning blond sex symbol in the late 1940s and early 1950s.

Appearing early in her career under the stage names of Catherine and Maryse Arley, she made her film debut in 1943, winning her first starring role in 1948. As the leading box-office star in France in the early 1950s, she appeared in several films as a genteel seductress; including the *Caroline Chérie* (1951) series and *Les Belles de nuit* (1952; "Beauties of the Night").

Carol was showcased by her director-husband Christian-Jaque in a series of elaborate period pieces such as *Madame Du Barry* (1954). Despite her creditable performance in the title role of *Lola Montès* (1955; *The Sins of Lola Montès*), Carol's career declined sharply in the late 1950's.

Carolan, Turlough: see O'Carolan, Turlough.

carole, medieval European dance in a ring or chain, performed to the singing of the dancers. An indefinite number of persons participated, linking arms and following the step of the leader. The origins of the carole are in ancient ring dances of May and midsummer festivals and, more remotely, in the ancient Greek *choros*, or circular, sung dance. Mentioned as early as the 7th century, the carole spread throughout Europe by the 12th century and declined during the 14th century.

There is good evidence that caroles were danced to ballads. Many ballad refrains sug-

Carole, miniature from "Remède de Fortune," by Guillaume de Marchant, 14th century; in the Bibliothèque Nationale, Paris (MS. Fr. 1586, fol. 51)

By courtesy of the Bibliothèque Nationale, Paris

gest dance movements (e.g., "bow-down, bow-down"). A relic of medieval Danish caroling survives in the circular ballad dances of the Faeroe Islands. The medieval French word *carole* (Medieval Latin: *chorea*; Middle High German: *reigen*) referred only to sung chain and ring dances; *danse* (Medieval Latin: *ballatio*; Middle High German: *tanz*) indicated a couple dance with instrumental accompaniment.

Chain dances of common origin with the carole and danced in serpentine chains, linked circles, or straight lines to singing or instrumental music persist in the 20th century in the Balkans (e.g., the Romanian hora, Serbo-Croatian kolo, Bulgarian hora, and Greek *syrtos*) and elsewhere (the farandole and carmagnole of France; the Catalanian sardana). In modern Switzerland a few *coraules* survive; they begin as a chain and end with couples dancing. *Choros* in modern Greek still means a circular dance. The branle, danced in the late European Middle Ages, derived from the carole. Some authorities believe that country dancing, with its lines or circles of couples, also derives from the carole.

Carolina, town, northeastern Puerto Rico, part of metropolitan San Juan, located about 12 miles (19 km) east of the national capital. Situated on the banks of the Loiza River just above its marshy lowlands near the coast, the town was in 1816 constituted a pueblo, named Trujillo Bajo; in 1857 the barrios (wards) north of the Loiza were separated under a new name, San Fernando de la Carolina, after Charles II of Spain. Under the new name, the town eventually absorbed the remainder of Trujillo Bajo.

Nearby is the site of Isla Verde international airport, the busiest in Puerto Rico. Sugarcane and tobacco are grown in the surrounding fields and processed locally; other industry includes a textile mill, manufacture of clay products, and production of high-quality sand for glass manufacture. Pop. (1990) mun., 177,806.

Caroline of Brandenburg-Ansbach, German KAROLINE VON BRANDENBURG-ANSBACH (b. March 1, 1683, Ansbach, Brandenburg-Ansbach [Germany]—d. Nov. 20, 1737, London, Eng.), wife of King George II of Great Britain (reigned 1727–60). Beautiful and intelligent, she exercised an influence over her husband that was decisive in establishing and maintaining Sir Robert Walpole as prime minister (1730–42).

The daughter of a German prince, Caroline married George Augustus (later King George II) in 1705. After her father-in-law became King George I in 1714, she helped ease the difficult situation created by the bitter quarrel between the king and her husband. Nevertheless, during the three years (1717–20) when George Augustus was banned from court, she made their London residence a lively centre of

opposition to the crown. Upon George II's accession in 1727, Caroline prevented him from ousting Walpole, who had become a leading minister, and she continued to dominate her husband until her death.

BIBLIOGRAPHY. Peter Quennel, *Caroline of England* (1939, reprinted 1973).

Caroline of Brunswick-Lüneburg, in full CAROLINE AMELIA ELIZABETH, German KAROLINE VON BRAUNSCHWEIG-LÜNEBURG, or KAROLINE AMALIE ELISABETH (b. May 17, 1768, Braunschweig [Germany]—d. Aug. 7, 1821, London, Eng.), wife of King George

Caroline of Brunswick-Lüneburg, pen and ink sketch by Sir George Hayter, in the British Museum

By courtesy of the trustees of the British Museum photograph, J. R. Freeman & Co. Ltd

IV of the United Kingdom who—like her husband, who was also her cousin—was the centre of various scandals.

The daughter of Charles William Ferdinand, duke of Brunswick-Lüneburg, Caroline married George (then prince of Wales) on April 8, 1795, but they separated soon after the birth of their only child, Princess Charlotte (Jan. 7, 1796). In December 1805 a committee of the Privy Council acquitted her of the charge of having given birth to a son by another man.

Excluded from the court while her husband was regent (1811–20) for his insane father, George III, Caroline lived chiefly in Italy from 1814 and allegedly maintained an adulterous relationship with her Italian courier, Bartolomeo Pergami (in England often called Bergami). After his accession on Jan. 29, 1820, George IV tried to pay her to remain on the European continent, but in June she returned to England. Thereupon the government introduced a bill to dissolve the marriage and deprive her of the title of queen. After a lengthy hearing (August 17–November 10), the House of Lords abandoned the bill. She was prevented from entering Westminster Abbey at George's coronation (July 19, 1821), became ill, and died 19 days later.

Caroline Atoll, also called THORNTON ISLAND, coral formation in the Central and Southern Line Islands, part of Kiribati, in the southwestern Pacific Ocean, about 450 miles (720 km) northwest of Tahiti. It is made up of 20 islets, with a total area of 1.45 square miles (3.76 square km), that rise to 20 feet (6 m) above mean sea level and enclose a shallow lagoon (6 miles by 1 mile).

Once occupied by Polynesians, the islets were sighted in 1795 by Captain William R. Broughton, an Englishman. Claimed by Britain in 1868, the atoll became a part of the Gilbert and Ellice Islands Colony in 1972 and a part of independent Kiribati in 1979. There are no permanent inhabitants.

Caroline Islands, archipelago in the western Pacific Ocean, the islands of which comprise the Federated States of Micronesia (Kosrae [Kusaie], Pohnpei [Ponape], Chuuk [Truk], and Yap) and Palau. The Carolines may be divided into two physiographic units: to the east, coral caps surmount mountains of volcanic origin; while to the west, the islands are

sections of the Earth's crust that have been folded and pushed above the surface of the ocean. Both units have formations rising to elevations of more than 500 feet (150 m). The total land area is about 500 square miles (1,300 square km) and includes the islands of Yap, Pohnpei, Chuuk, Kosrae, Babelthuap [Babeldoab], and Ulithi. The climate is tropical, with mean monthly temperatures ranging from 79° to 83° F (26° to 28° C). Rainfall is evenly distributed throughout the year and generally exceeds 120 inches (3,050 mm) annually on populated islands. It may exceed 180 inches (4,570 mm) on the windward sides of high islands. In an average year more than 20 typhoons originate in the Carolines.

The eastern Carolines were probably settled earlier than the 2nd century AD, and there is evidence indicating that Chinese trade goods had reached the western islands by the 7th century. Visited in the 16th century by Spanish navigators who named the islands for their king, Charles II, they were colonized by Spain only in the 19th century. Sold to Germany after the Spanish-American War (1898), in 1914 they were seized by Japan, who held them after 1919 as a League of Nations mandate. During World War II the islands, which had been heavily fortified by Japan, were occupied by the United States and became in 1947 part of a UN strategic trust territory under U.S. jurisdiction. After 1986 the trust territory included only the Republic of Palau, all other segments, including the Federated States of Micronesia, having adopted commonwealth status or a form of nationhood in close association with the United States.

Copra is the chief export, with handicrafts second. Tourism has been encouraged. The high western islands were mined during Japanese occupation. Some islands support tuna fishing.

Great diversity of physical types, cultures, and languages prevails within the Carolines, with the western islands exhibiting an intermingling of Melanesian and Philippine influences and the eastern showing Polynesian characteristics. Nukuoro and Kapingamarangi atolls represent western outliers of Polynesian culture. Pop. (1991 est.) 126,500.

Consult the INDEX first

Carolingian DYNASTY, family of Frankish aristocrats and the dynasty (AD 750–887) that they established to rule western Europe. The name derives from the large number of family members who bore the name Charles, most notably Charlemagne.

A brief treatment of the Carolingians follows. For full treatment, see MACROPAEDIA: France.

The family came to power as hereditary mayors of the palace of the Frankish kingdom of Austrasia, and, by the time of Pepin II of Herstal (or Heristal), who became mayor of the palace in 679, they had reduced their nominal Merovingian kings to mere figureheads. Indeed, in 687 Pepin II gained effective rule over the entire Frankish realm when he defeated his Neustrian rival, Ebroin. At his death in 714 Pepin left a legitimate heir, a child of six, and an illegitimate son, Charles Martel. By 725 Charles Martel had established himself as ruler of the Franks, although he maintained the fiction of Merovingian sovereignty until 737, when following the death of Theodorik IV he let the throne remain vacant. Charles Martel died in 741, and his sons Pepin III the Short and Carloman divided the realm between themselves. Upon Carloman's abdication in 747, Pepin III became the sole ruler. His position was so secure that in 750 he deposed the last of the Merovingians, Childeric III, and, with the support of Pope Zacharias,

Caroline of Brandenburg-Ansbach, detail of an oil painting after a portrait by Sir Godfrey Kneller, 1716; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

had himself elected king by an assembly of Frankish nobles and consecrated by a bishop of the Roman church.

The realm was again divided on Pepin III's death in 768, but the death three years later of Pepin's younger son Carloman reunited all the territories in the hands of Pepin's elder son, Charles, who became known as Charlemagne (*q.v.*). Charlemagne extended Frankish power by conquest over virtually all of Gaul and into Germany and Italy, and he made tributaries of the Bohemians, Avars, Serbs, Croats, and other peoples of eastern Europe. He formed an alliance with the papacy and in 774 created a papal state in central Italy. On Christmas Day 800, in the presence of Pope Leo III, he was crowned emperor of the restored Roman Empire. The unity that Charlemagne was able to impose on western Europe, however, fell victim to the ancient Frankish custom of dividing the realm among all a deceased king's sons. On the death of Charlemagne's sole surviving son and successor, Louis the Pious, in 840, three of his sons contested the succession. In the Treaty of Verdun in 843 they agreed to divide the empire into three kingdoms. Francia Occidentalis in the west went to Charles the Bald, Francia Orientalis in the east went to Louis the German, and Francia Media, including the Italian provinces and Rome, went to Lothair, who also inherited the title of emperor.

Subsequent partitions of the three kingdoms, together with the rise of such new powers as the Normans and the Saxons, whittled away at Carolingian authority. The imperial title passed from Lothair to his son Louis II in 855, from Louis II to his uncle Charles the Bald in 875, and, after an interregnum following Charles's death in 877, to Charles III the Fat, youngest son of Louis the German, in 881. By the time Charles III was deposed in 887 Carolingian power had all but dissolved in the empire, though Carolingian kings returned to power in France in 893/898–923 and 936–987.

Carolingian art, classic style produced during the reign of Charlemagne (768–814) and thereafter until the late 9th century.

Charlemagne's dream of a revival of the Roman Empire in the West determined both his political aims and his artistic program. His strong patronage of the arts gave impetus to a remarkable return to Roman classicism in the copying of Early Christian models and the influence of contemporary Byzantine and Greco-Roman styles, although the classicism was modified by local traditions favouring linearity and patterning and by Carolingian innovations (*see also* Anglo-Saxon art). Thus the Carolingian Renaissance was really a renovation rather than a true rebirth of classicism. It was, nevertheless, important for having revived the antique heritage in the West and for transmitting that interest to subsequent art. By the death of Charlemagne, the style was well defined, and even though local schools became more independent as the central authority of the empire weakened, the line of development continued until the chaotic late 9th century.

The influence of Roman architecture can be seen in the revival of the Early Christian basilica (*q.v.*), with its T-shaped plan; in fact, monks from Fulda were sent to Rome to measure St. Peter's in order that it might be reproduced locally. Byzantine architecture was also influential in the development of the Carolingian style. The octagonal plan of San Vitale, Ravenna (c. 526–547), for example, was the model for the Palatine Chapel (consecrated 805), built by Charlemagne for his court at Aachen. Finally, many features are Carolingian inventions that arose in response

to special needs. The most important of these were the westwork, or fortresslike construction with towers and inner rooms through which one entered the nave, and the outer crypt, or extensive chapel complexes below and beyond the eastern apse (projection at one end of the church). The significance of the westwork is not clear, but the crypt complex served the rising cult of saints, providing space for worship and for burial near their relics.

Located at Aachen were the imperial bronze foundry and the scriptorium, where manuscripts were copied and illuminated, though manuscript workshops at Tours, Metz, and Corbie also enjoyed imperial patronage.

Ivory book cover from the Lorsch Gospels, early 9th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London, Crown copyright

Manuscript illuminations (*see* Ada group) and the relief scenes of ivory and metalwork (sculpture in the round was rare) reflect an interest in copying classical motifs and models; the landscapes illustrating the Utrecht Psalter (c. 830; Utrecht, Bibliotheek der Rijksuniversiteit), for example, suggest the murals that adorned the walls of Roman villas. Mosaics and murals were also produced, but few have survived.

latter part of the 8th and early 9th centuries. As rediscovered and refined in the Italian Renaissance by the humanists, the script survives as the basis of the present-day Roman alphabet.

A learned English cleric, Alcuin of York, was in charge of Charlemagne's program, which was in itself a true literary renaissance. The principal centre was St. Martin's at Tours, of which Alcuin was abbot. Alcuin had previously been head of the cathedral school at York and of Charlemagne's Palace School at Aachen and had to his credit a number of splendid manuscripts known as the Golden Gospels. The most famous of these is the Godescalc Gospels (Bibliothèque Nationale, Paris), written before 783, with a dedication in Carolingian minuscule to Charlemagne.

The crowning achievement of the Tours school of scholars, Carolingian minuscule scribes, and artists was attained in the mid-9th century in the Gospels of Lothair, produced by Alcuin's successors.

Carolus (Latin personal name); *see under* Charles.

Caron, Antoine (b. c. 1515, Beauvais, France—d. 1593), one of the few significant painters in France during the reigns of Charles IX and Henry III; his work is notable for reflecting the elegant but unstable Valois court during the Wars of Religion (1560–98).

Caron was hired by Francesco Primaticcio, an Italian Mannerist painter, between 1540 and 1550 to work on the embellishment of the château of Fontainebleau. After the ascension of Henry III, he was commissioned to paint a series of works on the *Story of Artemis*, glorifying the widowhood of the queen mother, Catherine de Médicis; they were later made into tapestries.

Caron's few existing works fall into three main categories: (1) Allegorical topics, representing the life of the Valois court, including

"Augustus and the Tiburtine Sibyl," oil on canvas by Antoine Caron, c. 1580; in the Louvre, Paris

Graudon—Art Resource

"Triumph of the Seasons," with its depiction of parties, picnics, and orchestras; the Artemis series; and "History of the Kings of France." (2) Paintings on the theme of massacre, such as "Massacre Under the Triumvirate," recalling the bloodshed of the Wars of Religion. (3) Fantasy and magic, as in "Astrologers Studying an Eclipse" and "Augustus and the Tiburtine Sibyl." The allegorical treatment of court life, the violence, and the magic all express salient aspects of life in the late 16th century.

Stylistically, Caron was a Mannerist. His elongated figures, in twisted postures and with small heads and tapering arms and legs, frequently inhabit vast spaces. Caron's exaggerated perspective, in which the forms seem to disappear into space, and his nonnaturalistic use of colour are also in the Mannerist style.

Caron de Beaumarchais, Pierre-Augustin: see Beaumarchais, Pierre-Augustin Caron de.

Carondelet, (Francisco Luis) Hector, baron de (b. c. 1748, Noyelles, Flanders—d. Aug. 10, 1807, Quito, Viceroyalty of New Granada [Ecuador]), governor of the Spanish territory of Louisiana and West Florida from 1791 to 1797.

Carondelet was born of a distinguished Burgundian family and married into an influential Spanish family. He had served in a number of other Spanish colonial posts before his appointment to New Orleans.

Though he struggled valiantly with the many difficulties he met there and managed to construct a canal connecting New Orleans with the Gulf and to make a considerable number of other civic improvements, the problems presented by the native Indians and by U.S. encroachment proved to be too much for him. Both the United States and Spain claimed territory north of the 31st parallel of latitude, and to defend Spain's claim Carondelet formed alliances with local Indian tribes to repel U.S. settlers, installed a gunboat fleet on the Mississippi River, and built fortifications in the disputed area.

He also negotiated with General James Wilkinson and others in Kentucky to effect the secession of the trans-Appalachian territories from the United States and to secure their alliance with Spain. All this was terminated by Pinckney's Treaty (Treaty of San Lorenzo) in October 1795, in which Spain—embroiled in the French Revolutionary and Napoleonic Wars—agreed to set the U.S. southern boundary at latitude 31° and conceded U.S. citizens free passage on the Mississippi and tax-free storage of goods at New Orleans. Carondelet was relieved of his position in 1797 and became governor-general of Quito.

Caroni River, river in northwestern Trinidad Island, in the Trinidad and Tobago group in the southern Caribbean Sea. It rises near Valencia on the southern edge of the Northern Range uplands and flows roughly west to empty via the saline mangrove channels of the Caroni Swamp into the Gulf of Paria, between Trinidad and Venezuela, a mile or so south of Port-of-Spain. It drains the area between the Northern and Central ranges. Its length is about 25 miles (40 km), and it is partly navigable by flat-bottomed boats. In 1592 St. Joseph, on the Caroni's banks, became the first Spanish settlement.

Caroni River, Spanish río CARONÍ, river in Bolívar state, southeastern Venezuela. Its headwaters flow from the slopes of Mount Roraima in the Sierra Pacaraima, where Venezuela, Brazil, and Guyana meet.

The Caroni flows generally northward across the Guiana Highlands, covering much of southeastern Venezuela and emptying into the Orinoco River at San Félix, in the Ciudad Guayana area. It has a length of 430 miles (690 km). Although rapids hinder navigation near its mouth, the lower course of the river is navigable by launch. The spectacular Angel

Falls, highest in the world (3,212 feet [979 m]), are on a headstream of the Caroni. The river's great hydroelectric potential has been harnessed at Macagua and Guri dams.

Carora, city, west-central Lara *estado* ("state"), northwestern Venezuela, on the Morere, an affluent of the Tocuyo River, west of Barquisimeto. It lies at 1,128 feet (344 m) above sea level. The city has a fine parish church, a Franciscan convent, and a hermitage. Founded in 1572, it enjoyed considerable prosperity in colonial times, when its population numbered about 10,000. Horses, mules, and cattle are raised locally; and in addition to hides and leather, Carora exports coffee and rubber. Pop. (1990 est.) 79,907.

Carossa, Hans (b. Dec. 15, 1878, Tölz, Ger.—d. Sept. 12, 1956, Rittsteig, W.Ger.), poet and novelist whose contribution to the development of the German autobiographical novel was considered to be outstanding and unique in the 20th century.

Carossa, a physician who practiced in Passau, Nürnberg, and Munich, lived most of his life in Bavaria, whose people and their Roman Catholic Christianity, pagan folklore, and superstitions are described and pondered in much of his work.

Carossa's literary career began with a book of lyric poetry, *Stella Mystica* (1902; "Mystical Star"), in which a reflective, philosophical attitude dominates the expression of emotions. This attitude of detachment toward his own life and a desire to seek and bring forth the most noble in humankind remains dominant throughout his work. His first novel, *Doktor Bürgers Ende* (1913; "The End of Doctor Bürger"; revised and republished in 1930 as *Die Schicksale Doktor Bürgers*, "The Fortunes of Doctor Bürger"), in which a young doctor, driven to despair by the suffering around him, commits suicide when he fails to save the woman he loves, is an exploration of, as well as a variation on, Goethe's "Werther" theme—Carossa expressed his indebtedness to Goethe

Carossa
Bavaria Verlag

in *Die Wirkungen Goethes in der Gegenwart* (1938; "Goethe's Influence Today"). *Rumänisches Tagebuch* (1924; *A Roumanian Diary*; republished in 1934 as *Tagebuch im Kriege*, "War Diary") is an evaluation of Carossa's observations as an army doctor in Romania during World War I and a probe into the deeper mysteries of life; it was the first of his books to gain recognition outside of Germany.

More directly autobiographical works are *Eine Kindheit* (1922; *A Childhood*), *Das Jahr der schönen Täuschungen einer Jugend* (1941; *The Year of Sweet Illusions*), *Verwandlungen einer Jugend* (1928; *Boyhood and Youth*), and *Ungleiche Welten* (1951; "Different Worlds"). Carossa's last and unfinished work, *Der Tag des jungen Arztes* (1955; "The Day of the

Young Doctor"), is essentially an exploration of the conflicts between his duties as a physician and his responsibilities as a writer.

carotene, any of several organic compounds widely distributed as pigments in plants and animals and converted in the livers of many animals into vitamin A. These pigments are unsaturated hydrocarbons (having many double bonds), belonging to the isoprenoid series. Several isomeric forms (same formula but different molecular structures) are subsumed under the name.

In plants, carotenes impart yellow, orange, or red colours to flowers (dandelion, marigold), fruits (pumpkin, apricot), and roots (carrot, sweet potato). In animals they are visible in fats (butter), egg yolks, feathers (canary), and shells (lobster).

The most important provitamin (source of the vitamin A) is β -carotene, first isolated from carrots in 1910. Studies by several scientists culminated in its synthesis in 1950.

carotenemia, also called XANTHOSIS, CAROTENODERMIA, or ARTIFICIAL JAUNDICE, yellow skin discoloration caused by excess blood carotene; it may follow overeating of such carotenoid-rich foods as carrots, sweet potatoes, or oranges.

carotenoid, any of a group of nonnitrogenous yellow, orange, or red pigments (biochromes) that are almost universally distributed in living things. There are two major types: the hydrocarbon class, or carotenes, and the oxygenated (alcoholic) class, or xanthophylls. Synthesized by bacteria, fungi, lower algae, and green plants, carotenoids are most conspicuous in the petals, pollen, and fruit (e.g., carrots, sweet potatoes, tomatoes, and citrus fruits) of the flowering plants. They can also be seen in the autumn foliage of deciduous trees and shrubs. In the leaves of green plants, carotenoids serve as accessory pigments in photosynthesis, trapping solar energy and passing it to chlorophyll, the primary photosynthetic pigment. All animals and protozoans also contain carotenoids, which they obtain by ingestion. Vitamin A, for example, is one of the substances that animals obtain from the ingestion of carotene. Carotenoids also play a major role in the biological coloration of animals.

Carothers, Wallace Hume (b. April 27, 1896, Burlington, Iowa, U.S.—d. April 29, 1937, Philadelphia, Pa.), American chemist who developed nylon, the first synthetic polymer fibre to be produced commercially (in 1938) and one that laid the foundation of the synthetic-fibre industry.

At the University of Illinois and later at Harvard University, Carothers did research and teaching in organic chemistry. In 1928 he was appointed director of research in organic chemistry by E.I. du Pont de Nemours & Company at its laboratory in Wilmington, Del. He investigated the structure of substances of high molecular weight and their formation by polymerization. These fundamental investigations led to the development of nylon, an artificial fibre with properties similar and in many ways superior to such natural fibres as wool, cotton, and silk, and to neoprene, a synthetic rubber derived from vinylacetylene. Carothers committed suicide after a long period of depression.

carotid artery, one of several arteries that supply blood to the head and neck. Of the two common carotid arteries, which extend headward on each side of the neck, the left originates in the arch of the aorta over the heart; the right originates in the brachiocephalic trunk, the largest branch from the arch of the aorta. Each common carotid artery divides into an external and an internal carotid artery.

Each internal carotid artery ascends through the carotid canal in the temporal bone into the cranial cavity. It gives off an ophthalmic branch to the eyeball and other contents of the orbit and then divides into the anterior and middle cerebral arteries. The internal carotid arteries, together with the vertebral arteries, which are the arteries of primary supply for the brain, are distinguished by lying at some depth from the surface in their course to the organ, by having curves or twists in their course, and by having no larger collateral branches.

The external carotid artery ascends through the upper part of the side of the neck and behind the lower jaw into the parotid gland, where it divides into various branches. The external carotid artery gives off the following branches: (1) superior thyroid to the larynx and thyroid gland, (2) lingual to the tongue and sublingual gland, (3) facial to the face, palate, tonsil, and submaxillary gland, (4) occipital to the sternomastoid muscle and back of the scalp, (5) posterior auricular to the back of the ear and the adjacent part of the scalp, (6) superficial temporal to the scalp in front of the ear and, by its transverse facial branch, to the back part of the face, (7) maxillary, giving muscular branches to the muscles of mastication, meningeal to the dura mater, dental to the teeth, and other branches to the nose, palate, and tympanum, and (8) ascending pharyngeal, which supplies the pharynx, palate, tonsils, and dura mater.

carp (species *Cyprinus carpio*), hardy, greenish brown fish of the family Cyprinidae. It is native to Asia but has been introduced into Europe, North America, and elsewhere. A large-scaled fish with two barbels on each side of its upper jaw, the carp lives alone or in small schools in quiet, weedy, mud-bottomed ponds, lakes, and rivers. It is omnivorous, and in rooting about for food it often roils the water, increasing turbidity and adversely affecting many plants and animals. As a result, it is often considered undesirable, and much effort may be devoted to its extermination.

In winter the carp becomes torpid, retires to the bottom, and stops feeding. It usually spawns in spring, when the female deposits numerous eggs on plants or detritus, usually in shallow water. The eggs hatch four to eight days later. Carp grow rapidly, attain sexual maturity about the third year, and in captivity

Carp (*Cyprinus carpio*)
Jacques Six

may live more than 40 years. They average about 35 cm (14 inches) in length but may grow to more than 100 cm and 22 kg (49 pounds).

The carp is often raised for food, especially in Europe and Asia, because it is possible to produce large amounts of fish per acre. Two domesticated varieties of the species are the mirror carp (with a few large scales) and the leather carp (almost scaleless). The crucian carp (*Carassius carassius*) is a barbel-less European relative of the goldfish.

carp louse: see fish louse.

Carpaccio, Vittore (b. c. 1460, Venice [Italy]—d. 1525/26, Venice), greatest early Renaissance narrative painter of the Venetian school.

Carpaccio may have been a pupil of Lazzaro Bastiani, but the dominant influences on his early work were those of Gentile Bellini and Antonello da Messina. About 1490 he began painting a cycle of scenes from the legend of St. Ursula for the Scuola di Santa Orsola, now in the Accademia in Venice. In these works he emerged as a mature artist of originality, revealing a gift for organization, narrative skill, and a command of light. The genre scene of the "Dream of St. Ursula" has been noted especially for its wealth of naturalistic detail.

Meeting of Prince Ereus and St. Ursula and the Departure of the Betrothed, detail of a panel from the cycle "Scenes from the Life of St. Ursula," by Vittore Carpaccio, c. 1495; in the Accademia di Belle Arti, Venice

SCALA—Art Resource

Carpaccio's later career can be charted in terms of three further narrative cycles. The first of these survives intact in the Scuola di San Giorgio degli Schiavoni, in Venice. In the three scenes from the life of St. Jerome in this cycle, dating from 1502, the factor of direct observation plays an even larger part than in the St. Ursula cycle, and these paintings, from an artistic standpoint, represent the climax of Carpaccio's art. A cycle of scenes from the life of the Virgin, executed after 1504 for the Scuola degli Albanesi, is now scattered. Also dispersed is the cycle of scenes from the life of St. Stephen, painted between 1511 and 1520, that is stylistically reminiscent of his earlier works. He executed in 1510 the great altarpiece of the "Presentation in the Temple" for San Giobbe (now in the Accademia, Venice). His last dated works are two organ shutters for the Duomo at Capodistria (1523).

Carpaccio's precise rendering of architecture and the luminous atmosphere of his paintings were praised by the 19th-century English critic John Ruskin. Carpaccio's panoramic depictions of pageants, processions, and other public gatherings are notable for their wealth of realistic detail, sunny coloring, and dramatic narrative sense. His incorporation of realistic figures into an orderly and coherent perspectival space made him the first great Venetian painter of *vedute* ("townscapes").

carpal bone, any of several small angular bones that in humans make up the wrist (carpus), and in horses, cows, and other quadrupeds the "knee" of the foreleg. They correspond to the tarsal bones of the rear or lower limb. Their number varies. Primitive vertebrates typically had 12. In modern amphibians, reptiles, and birds, the number is reduced by fusion. In humans there are eight,

arranged in two rows. The bones in the row toward the forearm are the scaphoid, lunate, triangular, and pisiform. The row toward the fingers, or distal row, includes the trapezium (greater multangular), trapezoid (lesser multangular), capitate, and hamate. The distal row is firmly attached to the metacarpal bones of the hand. The proximal row articulates with the radius (of the forearm) and the articular disk (a fibrous structure between the carpals and malleolus of the ulna) to form the wrist joint.

carpal tunnel syndrome (CTS), a painful condition caused by repetitive flexing or stressing of the wrist over a long period of time. CTS is caused by pressure on the median nerve, which carries nervous impulses back and forth between the hand and the spinal cord.

The wrist joint is formed by a set of bones called the carpal bones. The carpal tunnel is a small passage on the inner side of the wrist that is bounded on three sides by the carpal bones and on the fourth by a ligament. Nine tendons that flex the fingers pass through the carpal tunnel (*i.e.*, enable them to close, as when making a fist). The median nerve also passes through the carpal tunnel. During movements of the fingers and wrist, the finger flexor tendons rub against the walls of the carpal tunnel. This may cause swelling of the tendons, and, because there is little room for them to expand, they squeeze against the median nerve, which is the softest tissue in the tunnel. This pressure causes numbness, tingling, and pain in the wrist and hand. Temporary loss of control of some of the hand muscles and difficulties in picking up or holding objects may occur if pressure on the nerve increases.

CTS typically occurs in individuals who do repetitive hand tasks or whose tasks require awkward hand positions; repeated, forceful gripping or grasping motions; or mechanical stress on the palms. CTS occurs most commonly in assembly-line workers and in people who spend prolonged periods of time typing on computer keyboards. Avoiding or reducing the activity responsible for the syndrome often alleviates the symptoms in mild cases. More serious cases are relieved by anti-inflammatory medications and the use of a wrist brace or splint. Surgery is also sometimes necessary to correct the condition.

Carpathian Mountains, crescent-shaped mountain range in east-central Europe. It extends approximately 900 miles (1,450 km) in a system of parallel structural ranges eastward from the Danube Gap near Bratislava, Slovakia, southward to Braşov, Romania, and southwestward to the portion of the Danube River valley called the Iron Gate, near Orşova, Romania.

A brief treatment of the Carpathian Mountains follows. For full treatment, see MACROPAEDIA: Europe.

The Carpathians include portions of the Czech Republic, Slovakia, Poland, Hungary, Romania, and Ukraine. The true geologic limits of the Carpathians extend into Austria in the west and Serbia and Montenegro in the south. Although they are the eastward continuation of the Alps, the Carpathians differ considerably from them; their structure is less compact, their summits are lower, and they are split up into a number of mountain blocks separated by basins. Gerlachovský štít (Mount Gerlach), the highest peak, rises to 8,711 feet (2,655 m).

Three ranges make up the Carpathian Mountains. The Outer Carpathians, made up of rocks composed of flysch (a sequence of shales interbedded with sandstones), run from near Vienna through Moravia, along the Polish-Czech frontier and through western Ukraine into Romania, ending in an abrupt bend of the Carpathian arc north of Bucharest. The Inner Carpathians are composed of numer-

ous separate blocks of ancient crystalline and metamorphic cores onto which younger sedimentary rocks have been overthrust. In the west lies the Central Slovakian block, in the southeast lies the East Carpathian block, and the isolated Bihor Massif occupies the centre. The third and innermost range of the Carpathians is built of young Tertiary volcanic rocks formed less than 50 million years ago, differing in extent in the western and eastern sections. In the western section the mountains extend in the shape of an arc enclosing, to the south and east, the Central Slovakian block. The eastern section runs nearly in a straight line from northwest to southeast. Between this volcanic range and the South Carpathian block (also called Transylvanian Alps), the Transylvanian Plateau spreads out, filled with loose rock formations of young Tertiary age.

Water runoff from the Carpathians escapes for the most part into the Black Sea by way of the Danube and Dniester rivers. Agriculture, forestry, and tourism are economically important in the Carpathians.

Carpeaux, Jean-Baptiste, also called JULES CARPEAUX (b. May 11, 1827, Valenciennes, France—d. Oct. 12, 1875, Courbevoie), the leading French sculptor of his time. His works, expressing a rhythm and variety that were in opposition to contemporary French academic sculpture, form a prelude to the sculpture of Auguste Rodin.

"The Dance," plaster sculpture by Jean-Baptiste Carpeaux, 1865–69; formerly on the facade of the Opéra, Paris, now in the Louvre, Paris

By courtesy of the Musée du Louvre, Paris. Cliche Musée National.

For some time Carpeaux was a student of the prominent French sculptor François Rude. Winning the 1854 Rome Prize enabled him to live at Rome (1854–61), where he was influenced by the works of such Italian Renaissance sculptors as Michelangelo, Donatello, and Verrocchio. He established his reputation with "Ugolino and His Sons" (1861), a dramatic bronze for the Tuileries Gardens, Paris, and won favour at the court of Napoleon III, receiving many commissions for portrait busts. His most famous work, "The Dance" (completed 1869), a sculptural group for the facade of the Paris Opéra, created a sensation and was attacked as immoral. His works were frequently the subject of hostile criticism, and in his last years he suffered from fears of persecution.

Carpentaria, Gulf of, shallow, rectangular inlet of the Arafura Sea (part of the Pacific Ocean), indenting the northern coast of Australia. Neglected for centuries, the gulf became internationally significant in the late

20th century with the exploitation of its bauxite, manganese, and prawn (shrimp) resources. The gulf has an area of 120,000 square miles (310,000 square km) and a maximum depth of 230 feet (70 m).

The Gulf of Carpentaria is enclosed on the west by Arnhem Land and on the east by the Cape York Peninsula. The gulf floor is the continental shelf common to Australia and New Guinea. The gulf-floor gradient is very low; the great western plains of Queensland slope north or northwestward into the gulf in a very gentle fall of only one foot per mile. As the plains approach the sea, they merge into a belt of salt flats, which are widest just west of the Flinders River. More than 20 rivers drain into the Gulf of Carpentaria; they wind profusely in their lower courses and have extensive deltas.

The eastern side of the gulf was first explored by the Dutch between 1605 and 1628, and the southern and western coasts were discovered by the explorer Abel Tasman in 1644. The gulf was named for Pieter Carpenter, who visited the area in 1628.

On the shores of the gulf are layers of bauxite up to 33 feet (10 m) thick. Overlying these deposits on Wellesley and Sir Edward Pellew islands are beds of sandstone that may represent a higher stand of sea level than that of today. Huge manganese deposits in the west of the gulf appear to have been formed along an irregular shoreline of an ancestral gulf.

The salt pans of the southeastern gulf shores are the result of complexly interacting factors. In summer (November to April), with very flat land drainage, monsoonal rain, magnified tides, and wind piling up the sea on shore, the salt pan area is submerged by the sea, and behind it the land area is submerged by the drainage water backing up the blocked estuaries. The junction of saltwater and freshwater floods is marked by the transition from bare salt pan to vegetated plains.

Prawn fishing developed rapidly in the gulf from the late 1960s. The town of Karumba, located at the southeastern end of the gulf, is a centre of the prawn fishing industry. Banana prawns are the major catch. Huge manganese deposits are being mined on Groote Eylandt and equally vast bauxite deposits are being exploited at Weipa, on the Cape York Peninsula, and at Gove Peninsula, in Arnhem Land.

As a result of these economic developments, settlement on the shores and islands of the gulf increased from a mere handful to several thousand people, and transport and communication links with the rest of Australia and the world have improved.

Carpenter, Edward (b. Aug. 29, 1844, Brighton, Sussex, Eng.—d. June 28, 1929, Guildford, Surrey), English writer identified with social reform and the late 19th-century anti-industrial Arts and Crafts Movement.

Carpenter entered the University of Cambridge in 1864 and was elected a fellow and ordained in 1869. In 1874, revolting against the social and religious conventions of his

Edward Carpenter, detail of a portrait by R.E. Fry; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

time, he became a traveling lecturer for the newly founded university extension movement, which attempted to serve people unable to attend the universities.

Carpenter had long been influenced by the work of Walt Whitman, whose verse forms he followed in his long, unrhymed poem *Towards Democracy* (1883; expanded 1905). He had met Whitman on a visit to the United States in 1877. In 1883 he bought a small farm in Derbyshire, where he lived until 1922 with a succession of working-class friends.

As a socialist, he was a follower of William Morris and was more interested in the reform of society and the return to rural crafts than in political revolution. His papers on social subjects (*England's Ideal*, 1887; *Civilization: Its Cause and Cure*, 1889, enlarged, 1921) brought him many visitors. These papers were widely translated, as were his later works on the relation of art to life (*Angels' Wings*, 1898; *The Art of Creation*, 1904) and on relationships between the sexes (*Love's Coming-of-Age*, 1896; *The Intermediate Sex*, 1908)—both influenced by Havelock Ellis. He had a lifelong interest in music and composed the well-known labour song "England Arise."

Carpenter, John Alden (b. Feb. 28, 1876, Park Ridge, Ill., U.S.—d. April 26, 1951, Chicago), American composer who was prominent in the 1920s and was one of the earliest to use jazz rhythms in orchestral music.

Carpenter studied at Harvard University under the conservative, German-influenced composer John Knowles Paine but then joined his father's shipping supply firm, of which

John Carpenter, 1932

By courtesy of the Library of Congress, Washington, D.C.

he was vice president (1909–36). In 1906 he studied music under Sir Edward Elgar. After 1936 he concentrated solely on composition. Basically a conservative composer influenced by the French Impressionists, he incorporated jazz rhythms into his *Concertino for Piano and Orchestra* (1917) and into his ballets *Krazy Kat* (1922) and *Skyscrapers* (1926); the last was later made into a symphonic piece. His humorous orchestral suite *Adventures in a Perambulator* also won considerable popularity.

Carpenter, M. Scott, in full MALCOLM SCOTT CARPENTER (b. May 1, 1925, Boulder, Colo., U.S.), second U.S. astronaut to make an orbital spaceflight. In *Aurora 7* he made the fourth Mercury flight, circling the Earth three times on May 24, 1962. He directed part of the flight by manual control.

Carpenter entered the U.S. Navy in 1949 and served in the Korean War. He had been a Navy test pilot and had attended the Naval Air Intelligence School in 1958. He was one of seven men selected in April 1959 for the National Aeronautics and Space Administra-

tion's Project Mercury. In 1964 he broke his left arm in a motorcycle accident. The resultant inability to rotate his arm properly forced his removal from spaceflight status.

Scott Carpenter, 1964

By courtesy of the National Aeronautics and Space Administration

In 1965 Carpenter was detached from the space program to lead two teams in the Sealab II experiment, living and working 205 feet (62.5 metres) under the Pacific Ocean as part of the U.S. Navy's effort to find better rescue methods for submarines. In 1967 he helped set up Sealab III but retired from naval duty in 1969 to enter private oceanography and energy research.

Carpenter, Mary (b. April 3, 1807, Exeter, Devon, Eng.—d. June 14, 1877, Bristol, Gloucestershire), British philanthropist, social reformer, and founder of free schools for poor children, the "ragged schools."

Carpenter was educated in the school run by her father, a Unitarian minister, in Exeter. In 1829 she and her mother opened a girls' school in Bristol. Later she founded a ragged school in a Bristol slum (1846), a reformatory for boys (1852), and another for girls (1854).

In 1833, through the Indian leader Rammohan Ray and the Boston philanthropist Joseph Tuckerman, she became interested in India, which she visited four times. After her third visit (1869–70) Carpenter decided that she could supervise her model school for Hindu girls more effectively from England than in India. In the year of her return, she established a National Indian Association to inform English opinion on the needs of India. Three years later she visited North America and reported on the defects of the prison systems there, particularly in Canada.

Carpenter supported the movement for higher education for women and wrote pamphlets and books on ragged schools, reformatories, juvenile delinquency, and Indian social reform, all of which aroused interest and were responsible for legislation affecting reformatories and industrial schools.

Mary Carpenter, portrait after a photograph, c. 1860; in the City Art Gallery, Bristol, Eng.

carpenter bee, any of the insects of the family Xylocopidae (order Hymenoptera) found in most parts of the world. The small carpenter, *Ceratina*, is about six millimetres long and of metallic coloration. It nests in plant stems, which the female first hollows out and then packs with pollen and eggs. A number of individual cells are placed in a row, separated by thin partitions of wood debris mixed with saliva. The large carpenter, *Xylocopa*, somewhat resembles the bumblebee but differs in having a nonhairy abdomen and in its habit of nesting in a tunnel excavated within solid wood.

Carpenter Gothic, style of architecture that utilized Gothic forms in domestic U.S. architecture in the mid-19th century. The houses executed in this phase of the Gothic Revival style show little awareness of and almost no concern for the original structure and proportions of Gothic buildings and ornamentation. Much of this work could never have been executed if the scroll saw, also called the fret saw, had not been invented.

Carpenter Gothic is an eclectic and naive use of the most superficial and obvious motifs of Gothic decoration. Turrets, spires, and pointed arches were applied, in many instances with abandon, and there was usually no logical relationship of ornamentation to the structure of the house. At its best the work of the independent carpenter created some lively and charming homes. Carpenter Gothic houses were built throughout the United States, but surviving structures are found chiefly in the Northeast and the Midwest.

carpenter moth, any member of the small cosmopolitan insect family Cossidae (order Lepidoptera). Adults have vestigial mouthparts, long, thick bodies and gray to brown

Leopard moth (*Zeuzera pyrina*)

wings that are frequently mottled or spotted. The wingspan varies from under 2.5 centimetres (one inch) in the temperate zone to about 25 centimetres (10 inches) in *Xyleutes boisduvali* of Australia. The pale, nearly hairless larvae, which live one to three years, bore in wood or pithy stems and are highly destructive.

The carpenterworm moth (*Prinoxystus robiniae*) has a wingspan of about 5 cm (2 in.) and is the most familiar North American cossid. The mahogany-coloured larvae of the goat moth (*Cossus cossus*) attack deciduous trees and exude a strong, goatlike odour. The leopard moth (*Zeuzera pyrina*) has white wings with black or blue blotches; its larvae bore in deciduous and fruit trees for about

two years before pupating within their larval burrows.

Carpentier (y Valmont), Alejo (b. Dec. 26, 1904, Havana—d. April 24, 1980, Paris), novelist, musician, and journalist, at various times a Cuban insurgent, exile, and government official.

A second-generation Cuban of French and Russian parentage, Carpentier was educated in music and architecture at the University of Havana and studied in Paris. He returned to Cuba in 1920 and aligned himself with an avant-garde group of writers. He made his living as a journalist. When he openly condemned the Machado dictatorship in 1927, he was imprisoned and later, using another writer's passport, escaped to France, where he remained until 1939.

The documentary novel *¡Ecué-Yamba-Ó!*, begun while he was in prison, was published in Madrid in 1933. It is a sympathetic account of Negro life and culture in Cuba. In 1928 he became actively engaged in the Surrealist movement, contributing frequently to André Breton's journal *Révolution Surréaliste*, but later rejected the movement.

He worked in radio broadcasting (1932–39), and when he returned to Cuba he became director of radio station CMX in Havana, was editor of the newspaper *Tiempo nuevo*, and became professor of musicology at the Conservatorio Nacional (1941). In 1943 a visit to Haiti led to the novel *El reino de este mundo* (1949; *The Kingdom of This World*, 1957), a mixture of fantastic elements grounded in social reality, which told the story of the early 19th-century Haitian tyrant Henri Christophe. Throughout the 1940s and 1950s, Carpentier spent much time in Europe and North and South America, including service as cultural attaché in the Cuban embassy at Paris. From 1943 he contributed to *Orígenes*, a major Cuban cultural journal with influence throughout the Spanish-speaking world. He published a history of Cuban music, *La música en Cuba*, in 1946.

A trip to the interior of Venezuela in 1941 led to his masterpiece, *Los pasos perdidos* (1953; *The Lost Steps*, 1956, rev. ed., 1967), a widely acclaimed novel that tries to define the essence of Spanish-American reality as coexistence between primeval myths and a civilization imposed by the Spanish conquest.

Guerra del tiempo (1958; *War of Time*, 1970), a collection of stories and a novella, deals with repression and violence in Cuban life in the 1950s in terms of aspects of time. Carpentier returned to Cuba from Venezuela in June 1959, toward the end of the Castro revolution, bringing with him the manuscript of the novel *El siglo de las luces* (1962; *Explosion in the Cathedral*, 1963). It interprets the contradictions of the French Revolution, its violence and its loss of ideals, from a Caribbean point of view. Its ornate style is characteristic of all Carpentier's novels. After *Tientos y diferencias* (1964; "Acts of Feeling and Differ-

ences”), a collection of essays on cultural and literary themes, Carpentier became director of a series of weekly radio broadcasts on Cuban culture and the world. From 1970 he was again cultural attaché in the Cuban embassy at Paris. *El recurso del método* (1974; *Reasons of State*) is about the career of the dictator Machado. *Concierto barroco* (1974; “Baroque Concerto”) is a stylistically complex novel that reaffirms Carpentier’s views on the mixture of cultures in Spanish America.

Carpentier, Georges, byname ORCHID MAN (b. Jan. 12, 1894, Lens, France—d. Oct. 27, 1975, Paris), French boxer who was a world light-heavyweight champion (1920–22) and a European champion at four weight classes.

Carpentier’s victories over British opponents—Joe Beckett, “Bombardier” Billy Wells, and Ted “Kid” Lewis—made him a national

Carpentier (left) fighting George Cook
EB Inc

hero in France. He attracted international attention on July 2, 1921, when he fought Jack Dempsey for the world heavyweight championship in Jersey City, N.J., but was knocked out in the fourth round. The bout was the first prizefight for which ticket sales exceeded \$1,000,000. He staged a comeback match against Gene Tunney on July 24, 1924, in New York City but went down in the 14th round, hurt by a controversial low blow. After fighting in 109 bouts, winning 56 by knockouts, Carpentier retired in 1927. He became a fashionable restaurateur in Paris and was elected to the Boxing Hall of Fame in 1964.

carpentry, the art and trade of cutting, working, and joining timber. The term includes both structural timberwork in framing and items such as doors, windows, and staircases.

In the past, when buildings were often wholly constructed of timber framing, the carpenter played a considerable part in building construction; along with the mason he was the principal building worker. The scope of the carpenter’s work has altered, however, with the passage of time. Increasing use of concrete and steel construction, especially for floors and roofs, means that the carpenter plays a smaller part in making the framework of buildings, except for houses and small structures. On the other hand, in the construction of temporary formwork and shuttering for concrete building, the carpenter’s work has greatly increased.

Because wood is widely distributed throughout the world, it has been used as a building material for centuries; many of the tools and techniques of carpentry, perfected after the Middle Ages, have changed little since that time. On the other hand, world supplies of wood are shrinking, and the increasing cost of

obtaining, finishing, and distributing timber has brought continuing revision in traditional practices. Further, because much traditional construction wastes wood, engineering calculation has supplanted empirical and rule-of-thumb methods. The development of laminated timbers such as plywood, and the practice of prefabrication have simplified and lowered the cost of carpentry.

The framing of houses generally proceeds in one of two ways: in platform (or Western) framing floors are framed separately, story by story; in balloon framing the vertical members (studs) extend the full height of the building from foundation plate to rafter plate. The timber used in the framing is put to various uses. The studs usually measure 1.5 × 3.5 inches (4 × 9 cm; known as a “2 × 4”) and are spaced at regular intervals of 16 inches (41 cm). They are anchored to a horizontal foundation plate at the bottom and a plate at the top, both 2 × 4 timber. Frequently stiffening braces are built between studs at midpoint and are known as noggings. Window and door openings are boxed in with horizontal 2 × 4 lumber called headers at the top and sills at the bottom.

Floors are framed by anchoring 1.5 × 11-inch (4 × 28-centimetre) lumber called joists on the foundation for the first floor and on the plates of upper floors. They are set on edge and placed in parallel rows across the width of the house. Crisscross bracings that help them stay parallel are called herringbone struts. In later stages, a subfloor of planks or plywood is laid across the joists, and on top of this is placed the finished floor—narrower hardwood planks that fit together with tongue-and-groove edges or any variety of covering.

The traditional pitched roof is made from inclined studs or rafters that meet at the peak. For wide roof spans extra support is provided by adding a horizontal cross brace, making the rafters look like the letter A, with a V-shaped diagonal support on the cross bar. Such supports are called trusses. The principal timbers used for framing and most carpentry in general are in the conifer, or softwood, group and include various species of pine, fir, spruce, and cedar. The most commonly used timber species in the United States are Canadian spruces and Douglas fir, British Columbian pine, and western red cedar. Cedar is useful for roofing and siding shingles as well as framing, since it has a natural resistance to weathering and needs no special preservation treatment.

A carpenter’s work may also extend to interior jobs, requiring some of the skills of a joiner. These jobs include making door frames, cabinets, countertops, and assorted molding and trim. Much of the skill involves joining wood inconspicuously for the sake of appearance, as opposed to the joining of unseen structural pieces (see joint).

The standard hand tools used by a carpenter are hammers, pliers, screwdrivers, and awls for driving and extracting nails, setting screws, and punching guide holes, respectively. Planes are hand-held blades used to reduce and smooth wood surfaces, and chisels are blades that can be hit with a mallet to cut out forms in wood. The crosscut saw cuts across wood grain, and the rip saw cuts with the grain. Tennon and dovetail saws are used to make precise cuts for the indicated joints, and a keyhole saw cuts out holes. The level shows whether a surface is perfectly horizontal or vertical, and the trisquare tests the right angle between adjacent surfaces. These instruments are complemented by the use of power tools.

carpet: see rug and carpet.

carpet grass (*Axonopus affinis*), mat-forming perennial grass of the family Poaceae, native to sandy soils in southeastern North America. Carpet grass reaches a height of 20–50 cm (8–20 inches). It is occasionally used as a lawn

and pasture grass there and in warm parts of Australia.

A. compressus, a broader-leaved, closely related species native to South Africa, is also known as carpet grass. It too is used for lawns, though both species are often considered weeds.

carpet moss, any of the plants of the genus *Hypnum* (subclass Bryidae), which form dense green mats in many habitats throughout the world, especially on decaying wood in moist

Carpet moss (*Hypnum cupressiforme*)
Ingmar Holmsten

areas. A few species are aquatic. There are about 20 North American species of *Hypnum*. The feather moss (*q.v.*), or plumc moss, formerly *H. crista-castrensis*, is now considered to be a member of the genus *Ptilium*.

The male and female reproductive organs of some species of carpet mosses are borne on separate plants, and the cylindrical, curved capsules (spore cases) have beaked lids. The bright green *H. haldanianum* has straight, spreading phyllids (leaves); those of *H. cupressiforme*, common in Europe and rare but widely distributed in North America, are curved. The “sheet moss” used by florists is usually a golden-green species, *H. curvifolium*. Carpet moss has been used to stuff bedding; it was once believed to induce sleep.

carpet moth, any of several species of small, delicate moths belonging to the insect family Geometridae (order Lepidoptera). Together with the so-called pugs and waves, the carpet moths number about 12,000 species of Geometridae, occurring worldwide. Some carpet moths are active by night and some by day. They settle with their broad, patterned wings (span 2–4 cm) outstretched and flattened against the resting surface. The moths develop from twiglike caterpillars or loopers. Certain species damage foliage; others are crop pests.

carpet shark, any of the approximately 25 species of sharks constituting the family Orectolobidae. They are found in all oceans but are concentrated in the Indo-Pacific and Australian regions. Many species are large, but they are not considered dangerous to humans, although they may protect themselves if harmed. Some species of carpet sharks bear live young, while others lay eggs. The nurse shark (*q.v.*: *Ginglynostoma cirratum*), which reaches a length of more than 4 m (13 feet), is the only species of carpet shark found in the Atlantic Ocean. Many species of carpet sharks are bottom feeders, primarily eating mollusks and crustaceans.

carpetbagger, during the Reconstruction period (1865–77) following the U.S. Civil War, any Northern politician or financial adventurer accused of going South to use the newly

enfranchised freedmen as a means of obtaining office or profit. The epithet originally referred to an unwelcome stranger coming, with no more property than he could carry in a satchel (carpetbag), to exploit or dominate a region against the wishes of some or all of its inhabitants. Although carpetbaggers

"The Man with the (Carpet) Bags"; cartoon by Thomas Nast, 1872, depicting the Southern attitude toward Northerners during Reconstruction
The Granger Collection

often supported the corrupt financial schemes that helped to bring the Reconstruction governments into ill repute, many of them were genuinely concerned with the freedom and education of black citizens.

Carpi, town, Modena province, Emilia-Romagna region of northern Italy, north of Modena city. Carpi is distinguished by its great piazza, the largest in the region. Notable landmarks include the Renaissance town hall, formerly the castle of the Pio family, lords of Carpi from 1319 to 1525; the cathedral (begun 1514), with a Baroque facade (1667); the Romanesque church of Sta. Maria in Castello, or La Sagra (altered 1515); the former cathedral, with a Romanesque campanile (1217–21); and several other fine old churches. A rail junction and commercial centre, Carpi's industries include food processing, straw plaiting, distilling, and the manufacture of shirts and hosiery. Pop. (1999 est.) mun., 61,154.

Carpi, Jacopo Berengario da: *see* Berengario da Carpi, Jacopo.

Carpi, Ugo da (b. c. 1480, Carpi, Duchy of Modena—d. between 1520 and 1532), painter and printmaker, the first Italian practitioner of the art of the chiaroscuro woodcut, a technique involving the use of several wood blocks to make one print, each block cut to produce a different tone of the same colour.

Carpi was active in Venice and Rome. Many of his chiaroscuro prints are after drawings by Raphael and Parmigianino. His claim to the invention of this process has long been contested. Hans Burgkmair and Lucas Cranach were known to have made chiaroscuro prints in the north before 1510, whereas there is no definite evidence of Ugo's work in this technique until 1516, when he appealed to the Venetian senate for protection from his imitators. None of his paintings survives.

Carpini, Giovanni da Pian del (Franciscan author): *see* Giovanni da Pian del Carpin.

Carpocratian, follower of Carpocrates, a 2nd-century Christian Gnostic, *i.e.*, a religious dualist who believed that matter was evil and the spirit good and that salvation was gained through esoteric knowledge, or gnosis. The sect flourished in Alexandria. Carpocratians

revered Jesus not as a redeemer but as an ordinary man whose uniqueness flowed from the fact that his soul had not forgotten that its origin and true home was within the sphere of the unknown perfect God. In other words, Jesus was to them a fellow Gnostic and as such a model for imitation. Carpocratians completely rejected the created world by identifying themselves with spiritual reality. They claimed to communicate with demonic spirits and presented this as proof of their power over, and superiority to, the material world. The subversion of Jewish biblical law was considered a serious responsibility because they claimed it came from evil angels who created the world.

The Carpocratians have been called libertine Gnostics because they contended that the attainment of transcendent freedom depended on having every possible experience, sinful or otherwise. Such an array of experiences normally required more than one lifetime, so the Carpocratians espoused the doctrine of the transmigration of souls, perhaps inspired by Indian or Pythagorean beliefs.

Apparently the Carpocratians had a more fully developed cult than other Gnostic groups, for they made brightly coloured icons with images of Plato, Pythagoras, Aristotle, Jesus, and others. Indeed, they were the first sect known to have used pictures of Christ. They also practiced magic for such purposes as the making of love potions.

carpoid, member of an extinct group of unusual echinoderms (modern echinoderms include starfish, sea urchins, and sea lilies), known as fossils from rocks of Middle Cambrian to Early Devonian age (the Cambrian Period began about 570,000,000 years ago, and the Devonian Period began 395,000,000 years ago). Unlike other echinoderms, the carpoids display no radial symmetry, nor do they

Carpoid

seem to have had a water-vascular system. They do possess a calcitic system of plates, however, as well as stemlike or armlike appendages; carpoids generally have flat bodies. Some seem to possess gill slits, a feature found in primitive chordates; the carpoids may be related to the most primitive chordates or vertebrates and are ancestral to the more advanced echinoderms.

Carr, E(dward) H(allett) (b. June 28, 1892, London—d. Nov. 3, 1982, Cambridge, Cambridgeshire, Eng.), British political scientist and historian specializing in modern Russian history.

He joined the Foreign Office in 1916 and was assistant editor of *The Times* during 1941–46. He was subsequently tutor and fellow of Balliol College, Oxford, and a fellow of Trinity College, Cambridge. His best known works include the biography *Michael Bakunin* (1937) and the multivolume, four-part series *A History of Soviet Russia*, which includes *The Bolshevik Revolution 1917–23* (vol. 1, 1950; vol. 2, 1952; vol. 3, 1953), *The Interregnum 1923–24* (vol. 4, 1954), *Socialism in One Country 1924–26* (vol. 5, 1958; vol. 6, 1959; vol. 7, 1964), and *The Foundations of a Planned*

Economy, 1926–29 (vol. 8, with R.W. Davies, 1969, vol. 9, 1971, vol. 10, 1976–78). He also wrote *The New Society* (1951), *What Is History?* (1961), *1917: Before and After* (1968), and *From Napoleon to Stalin* (essays, 1980).

Carr, Emily (b. Dec. 13, 1871, Victoria, B.C., Can.—d. March 2, 1945, Victoria), painter and writer, regarded as a major Canadian artist for her paintings of western coast Indians and landscape.

While teaching art in Vancouver, B.C., Carr made frequent sketching trips to British Columbian Indian villages. Her work had little financial success and was interrupted for long periods by her attempts to earn a living. After ill health ended her painting trips, she turned to writing, producing six autobiographical books that were enlivened by satiric character studies. Among them are *Klee Wyck* (1941), dealing with the Indians; *The House of All Sorts* (1944), describing her experiences as a boardinghouse owner and dog breeder in Victoria; *Growing Pains* (1946), an autobiography; and *Pause: A Sketch Book* (1953), telling of her stay in an English sanatorium.

Carr, John Dickson, pseudonym CARR DICKSON, or CARTER DICKSON (b. Nov. 30, 1906, Uniontown, Pa., U.S.—d. Feb. 27, 1977, Greenville, S.C.), U.S. writer of detective fiction whose work, both intellectual and macabre, is considered among the best in the genre.

Carr's first novel, *It Walks by Night* (1930), won favour that endured as Carr continued to create well-researched "locked-room" puzzles of historical England. Though he wrote more than 70 books—as many as six a year—his work remained realistic and exciting. One of his later works is *The Hungry Goblin* (1972).

Carr's other successful work includes *The Life of Sir Arthur Conan Doyle* (1949) and *The Exploits of Sherlock Holmes* (1954), the further deeds of Doyle's famous sleuth co-written by Carr and Doyle's youngest son, Adrian. *The Bride of Newgate* (1950) is a historical novel in which a woman marries a condemned man an hour before he is to die. Carr also compiled an impressive crime reference library, and, while in England (1931–48), he wrote mysteries for the British Broadcasting Corporation, some of which were filmed.

Carr, Sir Robert: *see* Somerset, Robert Carr, earl of.

Carr-Saunders, Sir Alexander (Morris) (b. Jan. 14, 1886, Reigate, Surrey, Eng.—d. Oct. 6, 1966, Thirlmere, Cumberland), sociologist, demographer, and educational administrator who, as vice chancellor of the University of London, was largely responsible for establishing several overseas university colleges, some of which became independent universities. Among them were the universities of Khartoum, The Sudan; Malaya at Kuala Lumpur; Ibadan, Nigeria; the West Indies at Kingston, Jam.; and East Africa in Kenya, Tanzania, and Uganda.

Educated in biology, Carr-Saunders became a social worker in the East End of London, helping to direct (1912–13) Toynbee Hall, the pioneer British settlement house. Simultaneously, he studied law and was called to the bar in 1913. He was a professor of social sciences at the University of Liverpool (1923–37) and director of the London School of Economics and Political Science, University of London (1937–56). He began his work with the university colleges outside Europe shortly after World War II. He was knighted in 1946.

Carr-Saunders' first important book, *The Population Problem* (1922), was one of the earliest significant historical studies in demog-

raphy. His *World Population* (1936) contained demographic data on numerous countries that had never before been the subjects of such study. He also wrote *A Survey of the Social Structure of England and Wales* (with D. Caradog Jones, 1927), *The Professions* (with P.A. Wilson, 1933), and *New Universities Overseas* (1961).

Carrà, Carlo (b. Feb. 11, 1881, Quarngento, Italy—d. April 13, 1966, Milan), one of the most influential Italian painters of the first half of the 20th century, best known for his still lifes in the style of Metaphysical painting.

Carrà studied painting briefly at the Brera academy in Milan but was largely self-taught. In 1909 he met the poet Filippo Marinetti and the artist Umberto Boccioni, who converted him to Futurism, an aesthetic movement that exalted patriotism, modern technology, dynamism, and speed. Carrà's "The Funeral of the Anarchist Galli" (1911; Museum of Modern Art, New York City) shows the dynamic action, power, and violence characteristic of the Futurists.

With World War I the classic phase of Futurism ended and, although Carrà's collage "Patriotic Celebration, Free Word Painting" (1914; Gianni Mattioli Foundation, Milan) is based on Futurist concepts, he soon began to paint in a style of greatly simplified realism. "Lot's Daughters" (1915), for example, is an attempt to recapture the solidity of form and the stillness of the 13th-century painter Giotto. This new style was crystallized in 1917 when he met the painter Giorgio De Chirico, who taught him to convey in his paintings the unsettling sense of life in everyday objects. Carrà and De Chirico called their style *pittura metafisica* ("Metaphysical painting"), and their works of this period have a superficial similarity.

In 1918 Carrà broke with De Chirico and Metaphysical painting. Throughout the 1920s and '30s, he painted melancholy figurative works based on the monumental realism of the 15th-century Italian painter Masaccio. Through such moody but well-constructed works as "Morning by the Sea" (1928; Gianni Mattioli Foundation, Milan) and through his many years of teaching at the Milan Academy, he greatly influenced the course of Italian art between World Wars I and II.

Carracci, Agostino (baptized Aug. 16, 1557, Bologna, Papal States [Italy]—d. Feb. 23, 1602, Parma), Italian painter and printmaker.

Agostino was the older brother of the painter Annibale Carracci, with whom he traveled in northern Italy, visiting Venice and Parma. Agostino's "Adoration of the Shepherds" (1584) demonstrates the influence of the Venetian painters Tintoretto and Paolo Veronese. He subsequently followed the lead of his brother Annibale, whom he helped decorate the Galleria of the Palazzo Farnese in Rome from 1597 to 1599. In the latter year Agostino left Annibale to serve as court painter for Ranuccio Farnese in Parma; he died there without completing his own major endeavour in fresco, the decoration of a room in the Palazzo del Giardino. Agostino's painterly style was drier and less proficient than that of his brother. Engraving formed a major part of his output from 1580, however. His prints after paintings by Federico Barocci, Tintoretto, and Titian circulated widely throughout Europe and were appreciated by Rembrandt, among other artists.

Carracci, Annibale (b. Nov. 3, 1560, Bologna, Papal States [Italy]—d. July 15, 1609, Rome), Italian painter who was influential in recovering the classicizing tradition of the High Renaissance from the affectations of Mannerism. He was the most talented of the three painters of the Carracci family.

The sons of a tailor, Annibale and his older brother Agostino were at first guided by their

older cousin Lodovico, a painter who persuaded them to follow him in his profession. Annibale's precocious talents developed in a tour of northern Italy in the 1580s, his visit to Venice being of special significance. He is said to have lodged in that city with the painter Jacopo Bassano, whose style of painting influenced him for a time. Annibale may be credited with the rediscovery of the early 16th-century painter Correggio, who had been effectively forgotten outside Parma for a generation; Annibale's "Baptism of Christ" (1585) for the Church of San Gregorio in Bologna is a brilliant tribute to this Parmese master.

Venus and Anchises, detail from the frescoes in the Galleria of the Palazzo Farnese, Rome, by Annibale Carracci, 1597–1603/04

Scala/Art Resource, New York City

Back in Bologna, Annibale joined Agostino and Lodovico in founding a school for artists called the Accademia degli Incamminati. The "Enthroned Madonna with St. Matthew" (1588) Annibale painted for the Church of San Prospero, Reggio, displays two of the most persistent characteristics of his art: a noble classicizing strain combined with a genial and bucolic tone. By the time Annibale collaborated with the other two Carracci on frescoes in the Palazzo Magnani (now the Palazzo Salemi; 1588–90) and two other noble houses in Bologna, he had become the leading master among them. His orderly and airy landscapes in these palaces helped initiate that genre as a principal subject in Italian fresco painting.

In 1595 Annibale went to Rome to work for the rich young cardinal Odoardo Farnese, who wanted to decorate with frescoes the principal floor of his palace, which was one of the most splendid in Rome. In that city Annibale turned eagerly to the study of Michelangelo, Raphael, and ancient Greek and Roman art in order to adapt the style he had formed in the artistic centres of northern Italy to his new surroundings. Having decorated the Camerino (study) in the Palazzo Farnese, he was joined (1597) by Agostino in the chief enterprise of his career—painting the frescoes of the coved ceiling of the Galleria (1597–1603/04) with love fables from Ovid. These decorations, which interweave various illusions of reality in a way that was more complex even than Raphael's famous paintings in the Vatican loggia, were a triumph of classicism tempered with humanity. The powerfully modeled figures in these frescoes are set in a highly complex composition whose illusionistic devices represent an imaginative response to Michelangelo's frescoes on the Sistine Ceiling. Despite their elaborate organization, the frescoes are capable of direct appeal owing to their rich colours and the vigour and dynamism of their entire approach. The Galleria Farnese soon became and remained a virtually indispensable study for young painters until well into the 18th century and was an especially rich feeding ground for the Baroque imaginations of Peter Paul Rubens and Gianlorenzo Bernini, among others.

Annibale's long and intense labours in the

Palazzo Farnese had been dismally underpainted by Cardinal Farnese, and the painter never fully recovered from the ingratitude of his patron. He quit work altogether on the Palazzo Farnese in 1605 but subsequently produced some of his finest religious paintings, notably "Domine, Quo Vadis?" (c. 1601; National Gallery, London) and the "Pieta" (c. 1607; Louvre Museum, Paris). These works feature weighty, powerful figures in dramatically simple compositions. The lunette-shaped landscapes that Annibale painted for the Palazzo Aldobrandini, especially the "Flight into Egypt" and the "Entombment" (both c. 1604; Doria Pamphili Gallery, Rome), proved important in the subsequent evolution of the heroic landscape as painted in Rome by Domenichino and Nicolas Poussin. Annibale died in Rome after several years of melancholic sickness and intermittent production.

BIBLIOGRAPHY. An early biography is Giovanni P. Bellori, *The Lives of Annibale & Agostino Carracci* (1968), a modern translation of a 1672 Italian study. Denis Mahon, *Studies in Seicento Art and Theory* (1947, reprinted 1971), contains a brilliant critical rehabilitation of the Carracci. John R. Martin, *The Farnese Gallery* (1965), is a richly illustrated book devoted to Annibale's principal enterprise, especially to its iconography. Donald Posner, *Annibale Carracci: A Study in the Reform of Italian Painting Around 1590*, 2 vol. (1971), is a full-scale treatment. Charles Dempsey, *Annibale Carracci and the Beginnings of Baroque Style* (1977), argues for a new interpretation. Diane DeGrazia Bohlin, *Prints and Related Drawings by the Carracci Family: A Catalogue Raisonné* (1979), provides full information on approximately 240 prints of all three Carracci. A.W.A. Boschloo, *Annibale Carracci in Bologna. Visible Reality in Art After the Council of Trent*, 2 vol. (1974), analyzes the series of paintings produced between 1582 and 1595. S.J. Freedburg, *Circa 1600: A Revolution of Style in Italian Painting* (1983), is a short but scholarly treatment of Carravaggio and Annibale and Lodovico Carracci. Carl Goldstein, *Visual Fact over Verbal Fiction. A Study of the Carracci and the Criticism, Theory, and Practice of Art in Renaissance and Baroque Italy* (1988), explores the historiography of the painters in the context of the Renaissance tradition of writing artists' lives.

Carracci, Lodovico (baptized April 21, 1555, Bologna, Papal States [Italy]—d. Nov. 13, 1619, Bologna), Italian painter and printmaker noted for his religious compositions and for the art academy he helped found in Bologna in 1582, which helped renew Italian art in the wake of Mannerism.

The son of a butcher, Lodovico was the older cousin of the painters Annibale and Agostino Carracci. After working under the painter Prospero Fontana in Bologna, Lodovico visited Florence, Parma, and Venice before returning to his native Bologna. There, in 1582, he and his cousins founded the Accademia degli Incamminati, an art school that became the most progressive and influential institution of its kind in Italy. Lodovico led this school for the next 20 years, during which time he and his cousins trained some of the leading Italian artists of the younger generation, notably Guido Reni and Domenichino. The teaching techniques of the Carracci's academy were based on frequent observation of nature, the study and revision of poses from life, and boldness of scale in drawing figures with chalk.

In his own paintings of religious subjects, Lodovico gave his figures strong gestures amid flickering plays of light in order to communicate a sense of mystery and passionate spiritual emotion. The "Madonna and Child with St. Francis, St. Joseph, and Donors" (1591; Municipal Art Gallery, Cento) is typical of his early work. Lodovico's imaginative approach to religious sentiment and his emphasis on mood would influence various Italian Baroque painters. Lodovico collaborated with

his cousins on various fresco commissions, and, after the death of Annibale in 1609, he remained active in Bologna, where he painted a succession of altarpieces in an increasingly grandiose and heavily mannered style until his own death in 1619.

carrack porcelain, Chinese blue-and-white export pieces of the reign of Emperor Wan-li (1573–1620) during the Ming period. When a Portuguese armed merchantman, or *carraca*, was captured by the Dutch off Canton in 1602, the foundation year of the Dutch East India Company, the booty and subsequent pieces of Oriental porcelain were auctioned at Amsterdam for several million guilders. The Dutch *kraakporselein* was to have considerable influence on European pottery and taste, being copied at Delft and elsewhere. The vitreous-looking ware appears in many contemporary Dutch still-life paintings and interiors; it is decorated in a grayish blue colour, spontaneously painted and somewhat coarser in finish than China's own domestic ware of the period, and features such subjects as deer, ducks in pairs, rocks, and landscapes.

carrageen (alga): see Irish moss.

Carranza, Bartolomé de, also called **BAR-TOLOMÉ DE MIRANDA** (b. 1503, Miranda de Arga, Spain—d. May 2, 1576, Rome, Papal States [Italy]), Dominican theologian and archbishop of Toledo who was imprisoned for nearly 17 years by the Spanish Inquisition.

Carranza entered the Dominican convent of Benalque near Guadalajara, Spain, and had a brilliant scholastic career, holding responsible positions in his order. As the Holy Roman emperor Charles V's envoy, he took an active part (1545–47) in the Council of Trent.

Bartolomé de Carranza, engraving
By courtesy of the Biblioteca Nacional, Madrid

In 1546 Carranza published his *Summa conciliorum* ("Summary of the Council Meetings") and his *Quattuor controversiae* ("Four Controversies"). The latter work, an important study of the authority within the Roman Catholic church of tradition, Scripture, the pope, and the councils, forestalled the work of the Dominican theologian Melchor Cano, who accused Carranza of Lutheran opinions. In 1554–57 Carranza was in England as adviser to King Philip II of Spain at the king's marriage to Queen Mary I of England. In 1557 Philip named him archbishop of Toledo and primate of Spain. His *Comentarios sobre el catechismo christiano* (1558; "Commentaries on the Christian Catechism") brought about renewed accusations of Lutheranism. Carranza was arrested by the Inquisition (Aug. 22, 1559) and accused of urging Bible reading by laypersons and advocating the writing of theology in the vernacular. Though the Council of Trent in 1563 declared his work sound, Philip and the Inquisition would not yield, presumably for political reasons. Pope Pius V called Carranza to Rome in 1567, but he was not acquitted until 1576, when he was sent to

the Dominican priory of the Minerva, where he died 18 days later.

Carranza, Venustiano (b. Dec. 29, 1859, Cuatro Ciénegas, Mexico—d. May 20/21, 1920, Tlaxcalantongo), a leader in the Mexican civil war following the overthrow of the dictator Porfirio Díaz. He became the first president of the new Mexican Republic. A moderate who was tainted by his association with Díaz and his alliance with newer forces of economic exploitation, Carranza opposed the sweeping changes that followed the revolution.

The son of a landowner, Carranza became active in local and state politics in 1877. In 1910, as governor of Coahuila, he joined the struggle of Francisco Madero against Díaz and in 1913 led the forces against Victoriano Huerta, who had assassinated Madero. After Huerta fled in 1914, Carranza's Constitutionalist Army began to splinter. Rebels under the leadership of Pancho Villa and Emiliano

Venustiano Carranza, c. 1910
Archoivo Casasola

Zapata opposed his provisional government, demanding immediate social reforms. He secured his position as provisional president, however, when his army, led by General Alvaro Obregón, defeated the forces of Villa at Celaya in April 1915.

Carranza favoured political, but not social, reform. Only reluctantly did he accept the provisions of the 1917 constitution establishing basic reforms in landownership, control of natural resources, and labour and social legislation. When he became the constitutional president on May 1, 1917, he did little to effectuate those provisions. His term was marked by continued difficulties with Villa and Zapata, serious financial problems, and general social unrest brought on by his reluctance to institute far-reaching reforms.

Carranza was an ardent nationalist and was involved in serious controversies with the United States. Earlier (April 1914) he had opposed the United States' occupation of Veracruz, even though it was aimed at his enemy, Huerta; in March 1916 he had prevented the military expedition led by the U.S. general John J. Pershing from capturing Villa, who had raided Columbus, N.M., U.S.; and he angered the United States by his efforts (1918) to bring his country's oil industry under Mexican control. He was instrumental in keeping Mexico neutral in World War I.

When Carranza's term as president was due to end in December 1920, he attempted to force the election of his chosen successor, Ignacio Bonillas, despite opposition from his more radical generals. Obregón led an armed rebellion in April 1920, and Carranza fled the capital. When he headed for Veracruz with government records and treasure, his train was attacked. With a few followers, he fled on horseback into the mountains. On the night of May 20/21 he was betrayed and murdered.

Carrara, city, Massa-Carrara *provincia*, Toscana (Tuscany) *regione*, in north-central Italy. It lies along the Carrione River in the foothills of the Apuan Alps, just northwest of Massa and east of La Spezia. Acquired by

the Malaspina family in 1428, it constituted, with Massa, the principality (1568) and duchy (1633) of Massa-Carrara (*q.v.*). The city's notable landmarks include the 12th- to 14th-century cathedral, built in the Pisan style, and the academy of fine arts, housed in the former ducal palace. The city is famous for some of the world's finest marble, called Carrara, taken from nearby quarries and used by sculptors from Michelangelo to Henry Moore.

The Marina di Carrara, immediately to the southwest, is a beach resort on the Ligurian Sea, with port facilities for handling marble. Pop. (1990 est.) mun., 68,528.

Carrara FAMILY, also called **CARRARESI**, a medieval Italian family who ruled first as feudal lords about the village of Carrara in the countryside of Padua and then as despots in the city of Padua.

On transferring to Padua itself in the 13th century, the Carrara exploited the feuds of urban politics first as Ghibelline and then as Guelph leaders and were thus able to found a new and more illustrious dominion. The latter began with the election of Jacopo da Carrara as perpetual captain general of Padua in 1318 but was not finally established, with Venetian help, until the election of his nephew Marsiglio in 1337. For approximately 50 years the Carraresi ruled with no serious rivals except among members of their own family. Marsiglio was succeeded without incident by Ubertino (1338–45), but Marsigliello, who succeeded Ubertino, was deposed and murdered by Jacopo di Niccolò (1345–50). Jacopo was then murdered by Guglielmino and succeeded by his brother Jacopino di Niccolò (1350–55), and Jacopino in turn was dispossessed and imprisoned by his nephew Francesco il Vecchio (1355–87). The Carrara court was one of the most brilliant of the time. Ubertino in particular was a patron of building and the arts, and Jacopo di Niccolò was a close friend of Petrarch.

The lordship of Padua, however, though it extended to Belluno and Feltre (1361) and to Treviso (1383), was too small and finally too unpopular to survive the cupidity of greater neighbours, especially Venice and the Visconti of Milan. Francesco il Vecchio, reversing the family policy, inclined to the Visconti against the Venetians and formed an alliance (1385) with Gian Galeazzo Visconti against the della Scala, who were backed by Venice. His policy was ill-conceived: though Verona was taken, the Visconti promptly formed a further alliance with Venice itself and the Este for the conquest of Padua. Francesco had to surrender his dominions (1388) and died a prisoner of the Visconti (1392). His son and grandsons tried to retrieve their family fortunes but were ultimately destroyed by the Venetians.

Carrasquilla, Tomás (b. Jan. 17, 1858, Santo Domingo, Antioquia, Colom.—d. Dec. 19, 1940, Medellín), Colombian novelist and short-story writer who is best remembered for his realistic depiction of the people of his native Antioquia. His portrayal of the daily life and customs of the Antioqueños, in a simple and direct style, reflects his love of his land and its people and a deep understanding of their problems and the social forces that created them.

When the Colombian Civil War interrupted his study of law at Antioquia University, Carrasquilla began his long literary career with the publication of *Frutos de mi tierra* (1896; "Fruits of My Native Land"), a realistic novel critical of the hypocrisy of small-town life that immediately appealed to a wide audience. He continued to deal with regional subjects in his short stories and in such later novels as *El Padre Casafús* (1914; "Father Casafús") and *La Marquesa de Yolombó* (1928; "The Marchioness of Yolombó"). His blindness in later life did not prevent him from completing the work many critics consider his best, *Hace*

tiempos, 3 vol. (1935–36; “Long Ago”), which he was forced to dictate.

carrel, cubicle or study for reading and literary work; the word is derived from the Middle English *carole*, “round dance,” or “carol.” The term originally referred to carrels in the north cloister walk of a Benedictine monastery and today designates study cubicles in libraries. Carrels are first recorded in the 13th century at Westminster Abbey, London, though they probably existed from the late years of the 12th century.

The carrels in the cloister of Gloucester cathedral (formerly Benedictine Abbey of St. Peter) represent the most complete series of carrels in existence. Built as an integral part of the cloister in 1381–1412, there are 20 of them, two to each bay, divided by short partition walls, lighted by the cloister windows, and roofed at the level of the window transoms. Each originally contained a desk.

Carrel, Alexis (b. June 28, 1873, Sainte-Foy-lès-Lyon, Fr.—d. Nov. 5, 1944, Paris), French surgeon, sociologist, and biologist who received the 1912 Nobel Prize for Physiology or Medicine for developing a method of suturing blood vessels and who laid the groundwork for further studies of transplantation of blood vessels and organs. He also investigated preservation of tissues outside the body and the application of the process to surgery. His strain of chick heart tissue was kept alive for more than 30 years.

Carrel received his M.D. (1900) from the University of Lyon. In 1904 he left France for the U.S., working first at the University of Chicago and then at the Rockefeller Institute for Medical Research in New York City. During World War I Carrel returned to France, where he helped to develop the Carrel–Dakin method of treating wounds with antiseptic irrigations. After 1919 he continued his work at the Rockefeller Institute until World War II. In 1941 he became director of the Fondation Française pour l'Étude des Problèmes Humains in Paris.

His writings include *Man, the Unknown* (1935); *The Culture of Organs* (with C.A. Lindbergh, 1938); and *Reflections on Life* (1952).

Carrel–Dakin fluid: see Dakin's solution.

Carreño, (María) Teresa (b. Dec. 22, 1853, Caracas—d. June 12, 1917, New York City), celebrated Venezuelan pianist who was a player of great power and spirit, known to her public as the “Valkyrie of the piano.”

She was given her first piano lessons by her father, Manuel Antonio Carreño, a politician and talented amateur pianist. Exiled because of a revolution, the family settled in New York in 1862; there Carreño studied with Louis Moreau Gottschalk. She next spent four years in Paris as a pupil of Georges Mathias and Anton Rubinstein, after which she embarked upon a long and highly successful concert career. She was particularly esteemed in Germany, where she lived and taught for more than 30 years.

At various times she composed works for the piano as well as a string quartet and the *Petite danse tsigane* for orchestra; developed a mezzo-soprano voice of sufficient calibre to enable her to appear as an opera singer; and, with the second of her four husbands, Giovanni Tagliapietra, a baritone, organized and directed an opera company in Caracas. Her third husband was the pianist Eugène d'Albert. Her first husband, whom she married in 1872, was Emile Sauret, a violinist; her fourth husband (married 1902) was Arturo Tagliapietra, a brother of her second husband.

Carreño de Miranda, Juan (b. March 25, 1614, Avilés, Asturias, Spain—d. September 1685, Madrid), painter, considered the most important Spanish court painter of the

Baroque period after Velázquez. Influenced and overshadowed both by Velázquez and Van Dyck, he was nonetheless a highly original and sensitive artist in his own right.

“The Duke of Pastrama,” oil painting by Juan Carreño de Miranda; in the Prado, Madrid

Archivo Mas, Barcelona

Carreño studied painting under Pedro de las Cava and Bartolomé Román. He assisted Velázquez in the decoration of the Alcázar in Madrid and the other royal palaces and was appointed painter to King Charles II in 1669 and court painter in 1671.

Although he is known primarily as a portraitist, he also painted many religious works in oil and fresco that reveal a unique Baroque sensibility. Such works as his masterpiece, “Founding of the Trinitarian Order” (1666; Courson Castle, near Arpañón), are marked by mastery of execution, subtle interplay of light and shadow, and inventiveness of scene. Following the tradition of Velázquez' court portraits, he painted many pictures of the queen mother, Mariana of Austria, and traced in oil the decline of Charles II from a handsome child to a decrepit old man. Even the most repellent portraits of Charles possess the aristocratic elegance that characterize Carreño's paintings.

Carrera, José Miguel (b. Oct. 15/16, 1785, Santiago, Chile—d. Sept. 4, 1821, Mendoza, Arg.), leader in the early struggle for the independence of Chile and first president of that country.

By a coup d'état in 1811, Carrera placed himself at the head of the national government and later the same year made himself dictator. Soon, however, internecine strife developed in the independence movement that permitted the restoration of Spanish rule. Bernardo

José Miguel Carrera, detail of a portrait by an unknown artist

By courtesy of the Library of Congress, Washington, D.C.

O'Higgins was elevated to the leadership of the forces opposing Carrera, who in 1813 was removed from power by the junta in favour of O'Higgins; early in 1814, however, Carrera regained control. During the ensuing invasion of Spanish forces from Peru, both Carrera and O'Higgins were defeated at Rancagua (October 1814). Carrera sought aid against his opponents, first in Buenos Aires and then, in 1815, in the United States. On his return to Argentina in 1816, he was not allowed to continue into Chile, and so he helped Argentine provincial chiefs in sporadic revolts against Buenos Aires. Eventually betrayed by his own men, he was captured and shot.

Carrera, Rafael (b. Oct. 24, 1814, Guatemala City—d. April 4, 1865, Guatemala City), dictator of Guatemala and one of the most powerful figures of 19th-century Central America.

Carrera was born of white and Indian stock, had no formal education, and remained illiterate all his life. Nevertheless, with the support of the Indian peasantry, who revered him, and the lower clergy, who despised the anticlerical liberal government, he captured Guatemala City in 1838 and took power, which he exercised completely and ruthlessly until his death.

Carrera—deeply religious, a strong nationalist, and a political conservative—consolidated his rule in 1840 when he became dictator and took Guatemala out of the United Provinces of Central America, proclaiming it an independent republic. Recalling the Jesuits, he reestablished the Roman Catholic Church in 1852. In 1854 he abolished elections and became president for life. Under Carrera adventurers from Nicaragua led by William Walker were repulsed, two attempts by Mexico to annex Guatemala were thwarted, and the territorial expansion of British Honduras was limited. He intruded frequently into the affairs of neighbouring nations in behalf of their conservative forces.

Although Carrera was crude and brutal, the clergy and upper classes appreciated his regime for its stability, respect for property, and support of the church. The nation gained some economic progress and a measure of racial equality under his rule.

Carrhae (ancient Mesopotamian city): see Harran.

Carrhae, Battle of (53 BC), battle that stopped the Roman invasion of Parthian Mesopotamia by the triumvir Marcus Licinius Crassus. War was precipitated by Crassus, who wanted a military reputation to balance that of his partners, Pompey and Julius Caesar. With seven legions (about 44,000 men), but insufficient cavalry, he invaded Mesopotamia, which was defended by a Parthian noble of the Suren family (whose personal name is not known). Learning that Surenas (*i.e.*, “the Suren”) was in the desert east of the Euphrates River, Crassus left the cover of the river and struck out toward Carrhae; this move has been condemned as rash, but, since Seleucia on the Tigris was his ultimate objective, he had to cross open country at some time. Suddenly the Parthians were upon him, with a force of about 1,000 armoured knights and nearly 10,000 horse archers. His troops were neither acclimatized nor adapted to desert warfare. While his son Publius in vain launched a covering attack with his cavalry, the main Roman forces had formed a square against the encircling Parthians and tried unsuccessfully to cover both body and head with their shields against the showers of Parthian arrows.

Surenas' provision of a corps of 1,000 Arabian camels, one for every 10 men, enabled the Parthians to retire by sections and replenish their quivers. Crassus, lacking provisions, was compelled by his demoralized men to negoti-

ate but was cut down by the Parthians in the attempt. About 10,000 Romans escaped, but the rest of Crassus' men were either captured or killed. The Parthians had dealt a stunning blow to Roman prestige in the East, and the death of Crassus had serious repercussions on Roman political life.

carriage, four-wheeled, horse-drawn vehicle, the final refinement of the horse-drawn passenger conveyance. Wagons were also used for this purpose, as were chariots. By the 13th century the chariot had evolved into a four-wheeled form, unlike the earlier two-wheeled version most often associated with the Romans. In the 14th century the passenger coach form of vehicle began to evolve. Coaches featured a rear set of wheels much larger than the front set and, therefore, a shaped body. This provided greater passenger comfort despite its lighter construction and made it possible for it to be pulled by a single horse. These vehicles were first made in Hungary and by the 16th century were in use throughout western Europe. They came to be used in place of the heavier chariots for state processions and as the general transportation of the upper classes.

By the 17th century, heavier vehicles had evolved, including the omnibus, to be pulled by teams of horses over long distances. At the same time, lighter vehicles designed for style and speed were also developed, and the suspension of all such vehicles was gradually enhanced by the addition of steel springs and leather braces. Some of these carriages were further improved by being enclosed with wood, glass, and cloth. In the 18th and 19th centuries a wide variety of carriage types were in common use. In the United States the stagecoach became familiar as a means of public transportation. In Europe the cabriolet, a two-wheeled vehicle, was used for this purpose. Much of the construction and form of the carriage could be seen in the automobiles that came into use in the early part of the 20th century.

carriage of goods, in law, the transportation of goods by land, sea, or air. The relevant law governs the rights, responsibilities, liabilities, and immunities of the carrier and the persons employing the services of the carrier.

A brief treatment of the law of the carriage of goods follows. For full treatment, see *MACROPAEDIA*: Transportation Law.

Apart from the general law relating to carriers, law concerning carriage of goods is divided into three main areas: carriage of goods by land, carriage of goods by sea, and carriage of goods by air.

A carrier is a person who, gratuitously or for reward, carries passengers or goods, for business or personal reasons, from one place to another by land, sea, or air. Anglo-American common law divides carriers into two basic types: common carriers and private carriers. Common carriers hold themselves out as willing to carry persons or goods from place to place within the areas where they ply for hire. Such carriers are under obligation to accept all business offered to them if they have space. With few exceptions, in the case of goods, common carriers are strictly liable for loss, damage, or delay to the goods while in transit. An example of an exception is the interception or damage of goods in war by an enemy. Another example is the loss, damage, or delay resulting from an "act of God" (e.g., earthquakes, volcanic eruptions, sudden and unforeseen floods).

The wide-ranging, strict liability of common carriers for goods in their charge has been limited by statute. Carriers' liability can be further limited by special contract. In some cases, a private contract between the carrier and the consignor of goods has the effect of excluding

the operation of statutory provisions. In such instances, a common carrier will be regarded for the purposes of the law as a private carrier.

Unlike common carriers, private carriers are under no obligation to accept all business offered to them. Each act of carriage is performed under private contract; for example, contracts for furniture removal. In the case of private carriers, liability for loss, damage, or delay to goods in transit is limited to instances involving negligence. The onus of proving that loss, damage, or delay has *not* resulted from negligence is on the carrier. This liability for negligence may, however, be further limited by the agreed terms of the contract of carriage.

International carriage by road and rail is subject to international conventions (Berne Convention [1890 to 1961], Geneva Convention [1965]). An international convention covering the carriage of goods by sea gave rise to the Hague Rules (1924). Carriage of goods by air is also regulated by international convention (Warsaw Convention [1929], as amended by the Hague Protocol [1955] and the Guadalajara Convention [1961]).

Carrick, district, county of Cornwall and Isles of Scilly, England, extending as a 15-mi- (24-km-) wide band from the north to the south coast, across the centre of the Cornish peninsula. It covers an area of 178 sq mi (461 sq km).

Carrick has fertile farmland and a rural landscape, in contrast to the area of Redruth-Camborne to the west, scarred by past mining, and the St. Austell region to the east, with its vast pits and spoil heaps of the china clay industry. It is the locale of the county town, Truro, and a major port, Falmouth. Evidence of mining penetrates into the northwestern area, with tin production near Chacewater. Carrick is dominated by flat plateau surfaces, reaching 500 ft (150 m) in places, and incised by rivers.

The annual rainfall is normally between 40 and 50 in. (1,000 and 1,250 mm), which, together with mild winters, has encouraged mixed farming with an emphasis on dairying; some cattle and sheep are fattened. Barley is the major feed crop. On the protected west side of the Fal estuary, some fruit, early potatoes, and a variety of vegetables are grown. Hamlets and isolated farms are found on the plateau. Rock outcroppings on both the north and south coasts produce a spectacular coastline with cliffs, headlands, and sandy bays. On the north coast are 3 mi of sand dunes between Perranporth and Holywell. Tourism has helped the expansion of such villages as Perranporth, St. Agnes, and St. Mawes.

Truro is the focus for both ridge and valley routes and is an important administrative, distribution, and service centre.

The mouth of the River Fal and its tributaries have been submerged by a rise in sea level to form a deepwater inlet with several branches. The main inlet is Carrick Roads,

and Falmouth is located on a peninsula on the western side of its entrance. Penryn is located at the head of navigation on an arm of Carrick Roads. Pop. (1998 est.) 85,300.

Carrick (Scotland): see Kyle and Carrick.

Carrick, John Stewart, earl of: see Robert III under Robert (Scotland).

Carrick on Suir, Irish CARRAIG NA SIÚIRE, town, County Tipperary, Ireland, on the River Suir. Located beside the foothills of the Comeraghs and having steep, narrow streets, it is connected with its southern suburb Carrickbeg, in County Waterford, by two bridges across the Suir. Ormonde Castle, begun in 1309, was the seat of the Butlers, the dukes of Ormonde. Anne Boleyn, mother of Elizabeth I of England, is said to have been born there. In the 19th century, Carrick on Suir was an important manufacturing town. Present industries include textiles, pharmaceuticals, tanning, and leather manufacture. Pop. (1991) 5,143.

Carrickfergus, Irish CARRAIG FHEARGHAIS, town, seat, and district (established 1973), formerly in County Antrim, Northern Ireland, on the northern shore of Belfast Lough (inlet of the sea). The name, meaning "rock of Fergus," commemorates King Fergus, who was shipwrecked off the coast c. AD 320. Because of its strategic position on a rocky spur above the harbour, Carrickfergus Castle, a perfectly preserved relic of the Norman period, has played a large part in Irish history. It was besieged and taken by the Scot Edward Bruce, brother of King Robert I the Bruce, in 1316, but reverted to English rule in 1318 and remained an isolated stronghold of the English crown. In the English Civil War (1642-51) the castle was one of the chief places of refuge for the Protestants of Antrim; in 1642 the first presbytery held in Ireland met there. It was later held by partisans of the English king James II but surrendered in 1689 to the Duke of Schomberg, and in 1690 William III landed there on his expedition to Ireland.

Although chartered since the reign of Elizabeth I, the corporation of Carrickfergus town was superseded in 1840 by a board of municipal commissioners. Carrickfergus was the county town (seat) of Antrim until 1850. Local industries include synthetic fibre works and cigarette and clothing factories. The parish Church of St. Nicholas, begun by John de Courci at the end of the 12th century, is renowned for its monument (1625) to Lord Chichester, lord deputy of Ireland (1604-14). Carrickfergus district has an area of 30 sq mi (77 sq km) and is bordered by Newtownabbey district to the west and Larne district to the north. Its northwestern section is hilly terrain, sloping southward to the flat shores of Belfast Lough. Salt is mined at the village of Eden, northeast of Carrickfergus town, and a sizable wooded area in western Carrickfergus district affords scenic camping and hiking. Carrick-

Carrickfergus Castle facing Belfast Lough, Northern Ireland
Al Greene—Shostal/EB Inc

fergus town is a pleasure-boat centre and is connected by road to Belfast. Pop. (1991) town, 22,900; (1998 est.) district, 28,400.

Carrickmacross, lace produced at Carrickmacross, County Monaghan, Ire., from 1820, with interruptions, to the end of the century. There are two varieties, appliqué and guipure. The former is made by drawing the design, which usually has a continuous outline, on

(Top) Carrickmacross guipure, about 1880; (bottom) Carrickmacross appliqué, about 1886; both in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

a glazed, firm fabric, and covering it with a net and a close-weave muslin. The outline is covered by a whipped cord, and the excess muslin is cut away, leaving the net ground intact. Guipure has no net, the design elements being held together with brides and the excess muslin cut away. Frequently, both varieties are used together.

Carrier, French *PORTEUR*, also called *TAKULLI*, Athabaskan-speaking Indian tribe centred in the upper branches of the Fraser River between the Coast and Rocky mountains in what is now central British Columbia. Their name derives from the custom whereby widows carried the ashes of their deceased husbands in knapsacks for three years. They also assumed the name *Takulli* ("People Who Go upon the Water"), of obscure origin.

The Carrier shared many of the customs of the Northwest Pacific Coast Indians. For food they relied chiefly on the plentiful river salmon, hunted various local game, and collected such wild plant foods as berries and roots. They also exploited the abundant woodlands, making such goods as canoes, weapons, cooking vessels, and carved pillars denoting noble crests. Southern Carrier lived in semi-subterranean houses; northern Carrier made gabled houses of poles and planks much like those of their coastal neighbours. Both types of dwellings were communal.

The Carrier were semisedentary, having seasonal homes in regular organized villages. Their social organization was much like that of the coastal Indians: elaborate class structures composed of nobles, commoners, and slaves, with complex obligations usually to marry outside one's lineage, clan, and house. Each subgroup had exclusive rights to its territory, and encroachments by other subgroups constituted grounds for bloody reprisal or at least compensation. The Carrier also practiced

the *potlatch*, the custom of large gift-giving feasts or ceremonies for the recognition of such significant events as marriage.

Their religious beliefs centred vaguely on a great sky god but dealt chiefly with innumerable spirits in nature, which were contacted through dreams, visions, ritual, and magic. They also believed in both reincarnation and a nebulous afterlife.

European diseases and the disruptions of their old way of life had drastically reduced the Carrier population to about 4,500 in the late 20th century.

Carrier, Jean-Baptiste (b. March 16, 1756, Yolet, Fr.—d. Dec. 16, 1794, Paris), radical democrat of the French Revolution who gained notoriety for the atrocities he committed against counterrevolutionaries at Nantes.

By 1790, the year after the outbreak of the Revolution, Carrier was councillor to the *bailiage* (administrative district) of Aurillac. He became a prominent member of the Jacobin and Cordeliers clubs—two very influential revolutionary societies—and in September 1792 he was elected to the National Convention.

In March 1793 Carrier helped set up the Revolutionary Tribunal that tried suspected counterrevolutionaries. The Jacobins, in alliance with the Parisian lower classes, seized

Jean-Baptiste Carrier, lithograph by F.-S. Delpech after a portrait by J.-B. Belliard

By courtesy of the Bibliothèque Nationale, Paris

control of the Revolution in June 1793, and in August the Committee of Public Safety (the National Convention's executive body) sent Carrier on a mission to Brittany. Two months later he was ordered to save Nantes from the antirepublican insurgents of the Vendée.

Because he was unable to obtain enough food for the rebels jailed at Nantes, Carrier ordered many of them to be guillotined or shot. In addition, between November 1793 and January 1794 he had more than 2,000 prisoners loaded into boats that were scuttled in the Loire River. Word of these *noyades* ("mass drownings") reached Paris, and, on Feb. 8, 1794, Robespierre, the chief spokesman of the Committee of Public Safety, had Carrier recalled. Carrier helped bring about Robespierre's downfall on 9 Thermidor (July 27, 1794) and, during the ensuing Thermidorian reaction against the Jacobin regime, was convicted of mass murder and guillotined.

Carrier, Willis Haviland (b. Nov. 26, 1876, Angola, N.Y., U.S.—d. Oct. 7, 1950, New York City), American inventor and industrialist who formulated the basic theories of air conditioning. In 1902, while an engineer with the Buffalo Forge Company, Carrier designed the first system to control temperature and humidity. His "Rational Psychrometric Formulae," introduced in a 1911 engineering paper, initiated scientific air-conditioning design. He was a founder (1915) of the Carrier Corporation, manufacturer of air-conditioning equipment.

Carrier-Belleuse, Albert (-Ernest), original name ALBERT-ERNEST CARRIER DE BELLEUSE (b. June 12, 1824, Anizy-le-Château, Aisne,

Fr.—d. June 3, 1887, Sèvres), notable French sculptor who in his time was Auguste Rodin's greatest rival. He produced works noted for their grace and form rather than their inventiveness, including "L'Amour et l'Amitié" (1857), "Jupiter et Phébé" (1860), and "Bacchante" (1863). His celebrated pupil, Rodin, assisted him at Brussels in 1871 on the "Caryatides" of the new Bourse.

carrier wave, in electronics, the unmodulated single-frequency electromagnetic wave that carries the desired information—*i.e.*, is modulated by the information. *See* modulation (electronics).

Carriera, Rosalba (Giovanna) (b. Oct. 7, 1675, Venice—d. April 15, 1757, Venice), portrait painter and miniaturist, an originator of the Rococo style in France and Italy. She is best known for her work in pastels.

Some scholars suggest that Carriera learned lacemaking from her mother and that, as the lace industry declined, she instead began decorating snuffboxes for the tourist trade. Whatever the origins of her interest, Carriera first became known for her miniature portraits on snuffboxes. She was the first artist to use ivory rather than vellum as a ground for miniatures. By the time Carriera was age 25, her miniatures had won her special membership in the Academy of St. Luke in Rome.

Her art suited the refined and, to modern eyes, affected taste of her times. Many notables passing through Venice had her do their portraits. The collector and financier Pierre Crozat encouraged her to go to Paris. She did so in March 1720, accompanied by her family, and became the idol of the French capital; she received commissions for 36 portraits, among them one of Louis XV as a child. She became a member of the French Royal Academy in 1720 and the next year returned to Venice and her home on the Grand Canal. In 1730 she once more left Venice, this time to work for six months in Vienna, where Holy Ro-

man Emperor Charles VI became her patron and the empress became her pupil. After 1750 Carriera's sight failed.

Carrière, Eugène (b. Jan. 17, 1849, Gournay, Fr.—d. March 27, 1906, Paris), French painter, lithographer, and sculptor known for his scenes of domestic intimacy and for his portraits of distinguished literary and artistic

personalities, including his friends Alphonse Daudet, Anatole France, and Paul Verlaine. In 1870 Carrière entered the École des Beaux-Arts in Paris, and after service in the Franco-German War he returned to Paris to study with one of the leading French academic painters, Alexandre Cabanel. From 1877 he frequently included his wife in his portrayals of family groups and pictures of maternity. He employed the rich colours of Peter Paul Rubens and Diego Velázquez until about 1890, when he began to develop his own distinctive style: figures shrouded in a pearly mist, delicate, predominantly gray tonalities, and soft modeling.

Carrillo, Julián (b. Jan. 28, 1875, Ahualulco, Mex.—d. Sept. 9, 1965, Mexico City), Mexican composer, a leading 20th-century exponent of microtonal music (*i.e.*, music using intervals smaller than a half-tone, or half step).

Of Indian descent, Carrillo grew up mainly in Mexico City. He showed considerable musical talent very early. Later, in his early 20s, after studying violin and composition in Mexico City, he began to study in Europe. Throughout his life he toured extensively in both western Europe and the United States. From 1905 on, he held many important music positions in Mexico as composer, conductor, teacher, writer on music, and administrator.

Carrillo's interest in microtonal music was stimulated in 1895 by a class in Mexico on acoustics. He realized that the musical whole tone could be divided not only into two semitones (as it had been for centuries) but also into three third tones, four quarter tones, and so on. In the 1920s he began intensive investigations into the possibilities of composing with these microtonal intervals, through sixteenth tones, which he considered the smallest interval listeners could readily hear. He created a new system of music notation and had special instruments built on which his microtonal works could be performed.

Of Carrillo's six symphonies, three are microtonal. Two of his five masses are microtonal, as are six of his works for solo instruments with orchestra. He also composed chamber music and music for single instruments in both microtonal and non-microtonal idioms and wrote a number of articles and books.

Carrillo, Santiago (b. Jan. 18, 1915, Gijón, Spain), secretary-general of the Spanish Communist Party from 1960 to 1982. He received wide publicity from his book *Eurocommunismo y Estado* (1977; *Eurocommunism and the State*), which espoused the freedom and independence of national communist parties.

A native of Asturias, Carrillo joined the Spanish Communist Party at the time of the Popular Front's electoral victory in Spain in 1936. He was in charge of public order in Madrid, and some held him responsible for the massacre of prisoners at Paracuellos in November of that year. After the Spanish Civil War he went to the Americas, and he later spent many years in Paris. He participated in the founding, in July 1974, of the Junta Democrática Española, which partially united the opposition to the Franco regime, and in March 1977 he helped found the Coordinación Democrática, which incorporated the opposition parties and Spain's regional autonomy movements.

After its legalization in 1977, the Spanish Communist Party maintained a low profile while winning votes and parliamentary seats. Carrillo cooperated in the drafting of Spain's new constitution and supported the government in its attempts to cope with Spain's economic difficulties and its efforts to overcome terrorism. He favoured working for "a plurality of political parties and for democratic alternation between the majority and

the minority," and he supported the Basque and Catalan sections of the Communist Party in their desire to take an independent stance based on the needs of their own regions.

Carrillo y Sotomayor, Luis (b. 1583?, Córdoba, Spain—d. 1610, Puerto de Santo María), Spanish poet known as the chief exponent of *culturismo*, which developed from the highly ornate and rhetorical style *gongorismo*, originated by the poet Luis de Góngora. In Carrillo's treatise on poetry, *Libro de la erudición poética* (mod. ed., 1946), he attempted to justify his methods by claiming the merits of obscurity in poetry.

Although his life was short and his output small, he is considered to have written several fine poems. The ambitious *Fábula de Acis y Galatea* is his best-known work. His work was published, edited not too carefully, by his brother Alonso in 1611 and reedited in 1613.

Carrington (of Upton), Peter Alexander Rupert Carrington, 6th Baron, BARON CARRINGTON OF BULCOT LODGE (b. June 6, 1919, London, Eng.), secretary-general of the North Atlantic Treaty Organization (NATO) from 1984 to 1988.

Carrington was educated at Eton College and the Royal Military Academy (Sandhurst). After service in World War II, he became a junior minister under Winston Churchill. He entered Alexander Douglas-Home's Cabinet in 1963 and, after the Conservative defeat in the general election of 1964, led the opposition in the House of Lords. With the Conservatives back in power in 1970, he became defense secretary and, in the last days of the Edward Heath government, energy secretary.

When a Conservative government under Margaret Thatcher was formed in 1979, Carrington became foreign secretary. His charm and diplomatic skills enabled him to achieve a negotiated independence for Rhodesia (now Zimbabwe) and an end to the bloody civil war there in 1979–80. He then turned his attention to the Middle East and at the same time sought negotiated solutions to Britain's residual colonial problems. In April 1982 he resigned his post amid harsh criticism of his misreading of the intentions of the Argentine government regarding the Falkland Islands.

Carrington became secretary-general of NATO in June 1984. He emphasized the importance of communication with the Soviet Union, believing that issue to be central to the restoration of public confidence in NATO.

Carrington, Richard Christopher (b. May 26, 1826, London, Eng.—d. Nov. 27, 1875, Churt, near Farnham, Surrey), English astronomer who, by observing the motions of sunspots, discovered the equatorial acceleration of the Sun; *i.e.*, that it rotates faster at the equator than near the poles. He also discovered the movement of sunspot zones toward the Sun's equator as the solar cycle progresses.

The son of a brewer, Carrington was educated at Cambridge and in 1853 established his own observatory at Redhill, Reigate, Surrey. He published *A Catalogue of 3,735 Circumpolar Stars* (1857), but in 1865 his health failed and he did little work thereafter.

Carrió de la Vandra, Alonso, pseudonym CONCOLORCORVO (b. 1715, Gijón, Spain—d. 1778?), Spanish colonial administrator whose accounts of his travels from Buenos Aires to Lima are considered to be a precursor of the Spanish-American novel.

His *El Lazarillo de ciegos caminantes* (1775; *El Lazarillo: A Guide for Inexperienced Travellers Between Buenos Aires and Lima*) was originally attributed to Don Calixto Bustamante, Carrió's Indian guide and traveling companion. Investigation revealed that Carrió had used a pseudonym to avoid punishment for having been critical of the Spanish regime. Critics have praised the book's clear and vibrant style, detailed descriptions, and satiric

tone. Carrió's realistic observations of the life and customs of the *gauderos*, the cowboys of the pampa, contrast sharply with the highly romanticized picture of later writers.

carrion beetle, any of the approximately 175 species of the insect family Silphidae (order Coleoptera). The majority of these beetles feed on the bodies of dead and decaying animals, transforming them into a state more readily available to the environment. A few live in

Carrion beetle (*Silpha ramosa*)
Herbert Lanks

beehives as scavengers, and some eyeless ones live in caves, feeding on bat droppings. Carrion beetles range in size from minute to 35 mm (1.4 inches), averaging around 12 mm (0.5 inch). Many are brightly coloured—orange, yellow, or red—while others are black. The flat, flexible body and wings allow these insects to crawl under dead animals. The long, flat larvae that emerge from eggs deposited in carrion have a triangular point at each tapering end. After they emerge from the eggs, the larvae feed for the first few days on a brown liquid regurgitated by the parents.

Because some carrion beetles dig the ground out from under a carcass and, in effect, bury it, they are also known as burying beetles.

carrion-feeder: *see* scavenger.

carrion flower, any of about 75 species of succulent plants of the genus *Stapelia* of the milkweed family (Asclepiadaceae), native to tropical areas of southern Africa. They are named for the unpleasant odour of their large flowers. The carrion odour attracts flies, which pollinate the plants and lay their eggs there. Carrion flowers have thick, four-sided,

Zulu-giant (*Stapelia gigantea*)

grooved stems, often coloured or covered with outgrowths. The plants lack true leaves but have scales or spines. The flowers have purple, red, or yellow bars and markings. A few species are cultivated as ornamentals.

Smilax herbacea, a native American woodland vine, has malodorous flowers and is also called carrion flower. It is of the Liliales order.

carrion hawk: *see* caracara.

Carrión's disease: *see* bartonellosis.

Carroll, Anna Ella (b. Aug. 29, 1815, Somerset county, Md., U.S.—d. Feb. 19, 1894,

Washington, D.C.), political pamphleteer and constitutional theorist who claimed to have played a role in determining Union strategy during the American Civil War (1861–65).

A member of a distinguished Maryland family, Carroll emerged in the 1850s as a vigorous supporter of the anti-Catholic and anti-foreign Know-Nothing Party. During the Civil War, she became a propagandist for the Union side in her sensitive border state. In 1861–62 she wrote two lengthy pamphlets stressing the unconstitutionality of the Confederacy and espousing the power of the president in the readmission of seceded states and outlining the theory later actually used by President Abraham Lincoln to assert his right to control the emancipation of slaves and the postwar Reconstruction.

In 1861 Carroll submitted to the War Department a Tennessee River invasion plan, which she acknowledged at the time to be that of Charles Scott, a riverboat pilot and amateur war strategist. The plan was not adopted, but after the war she embarked on a campaign to obtain federal reimbursement for what she claimed was her successful wartime invasion strategy. Her dubious claim won occasional supporters, but endorsements were obtained in a questionable manner. Among woman suffragists, she became a symbol of the female victim of male injustice in the 1880s.

Carroll, Charles (b. Sept. 19, 1737, Annapolis, Md.—d. Nov. 14, 1832, Baltimore), American patriot leader, longest surviving signer of the Declaration of Independence, and the only Roman Catholic to sign that document.

Until 1765 Carroll attended Jesuit colleges in Maryland and France and studied law in France and England. Before and during the American Revolution, he served on committees of correspondence and in the Continental

Congress (1776–78), where he was an important member of the board of war. In 1776, with Benjamin Franklin, Samuel Chase, and his cousin, the Reverend John Carroll, he was sent to Canada in a fruitless effort to persuade Canadians to join the cause of the 13 colonies.

Carroll was a state senator in Maryland (1777–1800) and concurrently a U.S. Senator (1789–92). When political parties were formed in the United States, he became a Federalist.

Carroll, Earl (b. Sept. 16, 1893, Pittsburgh, Pa., U.S.—d. June 17, 1948, near Mount Carmel, Pa.), American showman, theatrical producer, and director, best known for his *Earl Carroll's Vanities* (1922–48), which were popular revues of songs, dances, and flamboyantly costumed ladies. Over the doors of his Earl Carroll Theatre in New York City and his Earl Carroll Restaurant in Hollywood he emblazoned his slogan, "Through These Portals Pass the Most Beautiful Girls in the World."

Carroll quit school at age 10, worked at odd jobs in Pittsburgh theatres from 1903 to

1910, and at age 16 worked his way around the world. In New York City he became successful as a songwriter (1912–17) and then as a producer and opened his first Earl Carroll Theatre in 1922; there and at a second Earl Carroll Theatre built in 1931 he produced 15 *Vanities* and two *Sketch Book Reviews* in the coming years. In 1938 he built his restaurant (including a theatre) in Hollywood and put on 12 more *Vanities*. Over the years he also produced or directed more than 60 Broadway and other plays and a few motion pictures. He died in the crash of a commercial airliner.

Carroll, John (b. Jan. 8, 1735, Upper Marlboro, Maryland [now in the U.S.]—d. Dec. 3, 1815, Baltimore), first Roman Catholic bishop in the United States and the first archbishop of Baltimore. Under his leadership the Roman Catholic church became firmly established in the United States.

Carroll was the son of a prominent Maryland family. Because there were no schools for the training of priests in the American colonies, he was sent abroad for his education, first to France and then to Belgium, where he was ordained (c. 1767). He taught philosophy and theology at the Jesuit colleges in Liège and Bruges, but the suppression of Jesuits by the papal brief of July 1773, vigorously enforced on the Continent, prompted him to seek refuge in England. By that time, however, the deteriorating relations between England and the Colonies were evident, and, sensing the climate of unrest, Carroll returned to Baltimore in the spring of 1774.

In the post-Revolutionary years, Carroll, who did not take an active part in the war, was instrumental in the reorganization of American Roman Catholics, no longer under the jurisdiction of the English church, and in efforts to establish satisfactory relations with Rome. In 1790 he was consecrated bishop of Baltimore—a diocese at that time encompassing the entire United States. He worked for the establishment in the United States of institutions for the training and ordination of native-born priests. In 1791 he founded the Sulpician seminary in Baltimore. He also encouraged Roman Catholic religious orders to establish branches in the United States, and, with the aid of George Washington, he secured federal funds for missionaries to the Indians of the West. In 1806 Carroll laid the cornerstone of the Baltimore cathedral, having collaborated with Benjamin Latrobe in the planning and design of the building. Following the erection of four new sees (Boston, New York, Philadelphia, and Bardonia, Ky.) in 1808, Carroll became archbishop (1811). During his years as head of the American church, the Roman Catholic population of the country grew from about 25,000 to 200,000.

Carroll, Lewis, pseudonym of CHARLES LUTWIDGE DODGSON (b. Jan. 27, 1832, Daresbury, Cheshire, Eng.—d. Jan. 14, 1898, Guildford, Surrey), English logician, mathematician, photographer, and novelist, especially remembered for *Alice's Adventures in Wonderland* (1865) and its sequel, *Through the Looking-Glass* (1871). His poem *The Hunting of the Snark* (1876) is nonsense literature of the highest order.

Dodgson was the eldest son and third child in a family of seven girls and four boys born to Frances Jane Lutwidge, the wife of the Rev. Charles Dodgson. He was born in the old parsonage at Daresbury. His father was perpetual curate there from 1827 until 1843, when he became rector of Croft in Yorkshire—a post he held for the rest of his life (though later he became also archdeacon of Richmond and a canon of Ripon cathedral).

The Dodgson children, living as they did in an isolated country village, had few friends outside the family but, like many other families in similar circumstances, found little difficulty in entertaining themselves. Charles from

the first showed a great aptitude for inventing games to amuse them. With the move to Croft when he was 12 came the beginning of the "Rectory Magazines," manuscript compilations to which all the family were supposed

Lewis Carroll, shown holding a camera lens; photograph by Oscar G. Rejlander, 1863

to contribute. In fact, Charles wrote nearly all of those that survive, beginning with *Useful and Instructive Poetry* (1845; published 1954) and following with *The Rectory Magazine* (c. 1850, mostly unpublished), *The Rectory Umbrella* (1850–53), and *Mischmasch* (1853–62; published with *The Rectory Umbrella* in 1932).

Meanwhile, young Dodgson attended Richmond School, Yorkshire (1844–45), and then proceeded to Rugby School (1846–50). He disliked his four years at public school, principally because of his innate shyness, although he was also subjected to a certain amount of bullying; he also endured several illnesses, one of which left him deaf in one ear. After Rugby he spent a further year being tutored by his father, during which time he matriculated at Christ Church, Oxford (May 23, 1850). He went into residence as an undergraduate there on Jan. 24, 1851.

Dodgson excelled in his mathematical and classical studies in 1852; on the strength of his performance in examinations, he was nominated to a studentship (called a scholarship in other colleges). In 1854 he gained a first in mathematical Finals—coming out at the head of the class—and proceeded to a bachelor of arts degree in December of the same year. He was made a "Master of the House" and a senior student (called a fellow in other colleges) the following year and was appointed lecturer in mathematics (the equivalent of today's tutor), a post he resigned in 1881. He held his studentship until the end of his life.

As was the case with all fellowships at that time, the studentship at Christ Church was dependent upon his remaining unmarried, and, by the terms of this particular endowment, proceeding to holy orders. Dodgson was ordained a deacon in the Church of England on Dec. 22, 1861. Had he gone on to become a priest he could have married and would then have been appointed to a parish by the college. But he felt himself unsuited for parish work and, though he considered the possibility of marriage, decided that he was perfectly content to remain a bachelor.

Dodgson's association with children grew naturally enough out of his position as an eldest son with eight younger brothers and sisters. He also suffered from a bad stammer (which he never wholly overcame, although he was able to preach with considerable success in later life) and, like many others who suffer

from the disability, found that he was able to speak naturally and easily to children. It is therefore not surprising that he should begin to entertain the children of Henry George Liddell, dean of Christ Church. Alice Liddell and her sisters Lorina and Edith were not, of course, the first of Dodgson's child friends. They had been preceded or were overlapped by the children of the writer George Macdonald, the sons of the poet Alfred, Lord Tennyson, and various other chance acquaintances. But the Liddell children undoubtedly held an especially high place in his affections—partly because they were the only children in Christ Church, since only heads of houses were free both to marry and to continue in residence.

Properly chaperoned by their governess, Miss Prickett (nicknamed "Pricks"—"one of the thorny kind," and so the prototype of the Red Queen in *Through the Looking-Glass*), the three little girls paid many visits to the young mathematics lecturer in his college rooms. As Alice remembered in 1932, they

used to sit on the big sofa on each side of him, while he told us stories, illustrating them by pencil or ink drawings as he went along . . . He seemed to have an endless store of these fantastical tales, which he made up as he told them, drawing busily on a large sheet of paper all the time. They were not always entirely new. Sometimes they were new versions of old stories; sometimes they started on the old basis, but grew into new tales owing to the frequent interruptions which opened up fresh and undreamed-of possibilities.

On July 4, 1862, Dodgson and his friend Robinson Duckworth, fellow of Trinity, rowed the three children up the Thames from Oxford to Godstow, picnicked on the bank, and returned to Christ Church late in the evening: "On which occasion," wrote Dodgson in his diary, "I told them the fairy-tale of *Alice's Adventures Underground*, which I undertook to write out for Alice." Much of the story was based on a picnic a couple of weeks earlier when they had all been caught in the rain; for some reason, this inspired Dodgson to tell so much better a story than usual that both Duckworth and Alice noticed the difference, and Alice went so far as to cry, when they parted at the door of the deanery, "Oh, Mr. Dodgson, I wish you would write out Alice's adventures for me!" Dodgson himself recollected in 1887

how, in a desperate attempt to strike out some new line of fairy-lore, I had sent my heroine straight down a rabbit-hole, to begin with, without the least idea what was to happen afterwards.

Dodgson was able to write down the story more or less as told and added to it several extra adventures that had been told on other occasions. He illustrated it with his own crude but distinctive drawings and gave the finished product to Alice Liddell, with no thought of hearing of it again. But the novelist Henry Kingsley, while visiting the deanery, chanced to pick it up from the drawing-room table, read it, and urged Mrs. Liddell to persuade the author to publish it. Dodgson, honestly surprised, consulted his friend George Macdonald, author of some of the best children's stories of the period. Macdonald took it home to be read to his children, and his son Greville, aged six, declared that he "wished there were 60,000 volumes of it."

Accordingly, Dodgson revised it for publication. He cut out the more particular references to the previous picnic (they may be found in the facsimile of the original manuscript, later published by him as *Alice's Adventures Underground* in 1886) and added some additional stories, told to the Liddells at other times, to make up a volume of the desired length. At Duckworth's suggestion he got an intro-

duction to John Tenniel, the *Punch* magazine cartoonist, whom he commissioned to make illustrations to his specification. The book was published as *Alice's Adventures in Wonderland* in 1865. (The first edition was withdrawn because of bad printing, and only about 21 copies survive—one of the rare books of the 19th century—and the reprint was ready for publication by Christmas of the same year, though dated 1866.)

The book was a slow but steadily increasing success, and by the following year Dodgson was already considering a sequel to it, based on further stories told to the Liddells. The result was *Through the Looking-Glass and What Alice Found There* (dated 1872; actually published December 1871), a work as good as, or better than, its predecessor.

By the time of Dodgson's death, *Alice* (taking the two volumes as a single artistic triumph) had become the most popular children's book in England: by the time of his centenary in 1932 it was one of the most popular and perhaps the most famous in the world.

There is no answer to the mystery of *Alice's* success. Many explanations have been suggested, but, like the Mad Hatter's riddle ("The riddle, as originally invented, had no answer at all"), they are no more than afterthoughts. The book is not an allegory; it has no hidden meaning or message, either religious, political, or psychological, as some have tried to prove; and its only undertones are some touches of gentle satire—on education for the children's special benefit and on familiar university types, whom the Liddells may or may not have recognized. Various attempts have been made to solve the "riddle of Lewis Carroll" himself; these include the efforts to prove that his friendships with little girls were some sort of subconscious substitute for a married life, that he showed symptoms of jealousy when his favourites came to tell him that they were engaged to be married, that he contemplated marriage with some of them—notably with Alice Liddell. But there is little or no evidence to back up such theorizing. He in fact dropped the acquaintance of Alice Liddell when she was 12, as he did with most of his young friends. In the case of the Liddells, his friendship with the younger children, Rhoda and Violet, was cut short at the time of his skits on some of Dean Liddell's Christ Church "reforms." For besides children's stories, Dodgson also produced humorous pamphlets on university affairs, which still make good reading. The best of these were collected by him as *Notes by an Oxford Chiel* (1874).

Besides writing for them, Dodgson is also to be remembered as a fine photographer of children and of adults as well (notable portraits of the actress Ellen Terry, the poet Alfred, Lord Tennyson, the poet-painter Dante Gabriel Rossetti, and many others survive and have been often reproduced). Dodgson had an early ambition to be an artist: failing in this, he turned to photography. He photographed children in every possible costume and situation, finally making nude studies of them. But in 1880 Dodgson abandoned his hobby altogether, feeling that it was taking up too much time that might be better spent. Suggestions that this sudden decision was reached because of an impurity of motive for his nude studies have been made, but again without any evidence.

Before he had told the original tale of *Alice's Adventures*, Dodgson had, in fact, published a number of humorous items in verse and prose and a few inferior serious poems. The earliest of these appeared anonymously, but in March 1856 a poem called "Solitude" was published over the pseudonym Lewis Carroll. Dodgson arrived at this pen name by taking his own names Charles Lutwidge, translating them into Latin as Carolus Ludovicus, then reversing and retranslating them into English. He used

the name afterward for all his nonacademic works. As Charles L. Dodgson, he was the author of a fair number of books on mathematics, none of enduring importance, although *Euclid and His Modern Rivals* (1879) is of some historical interest.

His humorous and other verses were collected in 1869 as *Phantasmagoria and Other Poems* and later separated (with additions) as *Rhyme? and Reason?* (1883) and *Three Sunsets and Other Poems* (published posthumously, 1898). The 1883 volume also contained *The Hunting of the Snark*, a narrative nonsense poem that is rivalled only by the best of Edward Lear.

Later in life, Dodgson had attempted a return to the *Alice* vein but only produced *Sylvie and Bruno* (1889) and its second volume, *Sylvie and Bruno Concluded* (1893), which has been described aptly as "one of the most interesting failures in English literature." This elaborate combination of fairy-tale, social novel, and collection of ethical discussions is unduly neglected and ridiculed. It presents the truest available portrait of the man, *Alice*, the perfect creation of the logical and mathematical mind applied to the pure and unadulterated amusement of children, was struck out of him as if by chance; while making full use of his specialized knowledge, it transcends his weaknesses and remains unique. (R.L.G.)

Other studies of importance include Helmut Gernsheim, *Lewis Carroll: Photographer*, new ed. (1969); Morton N. Cohen, *Lewis Carroll, Photographer of Children: Four Nude Studies* (1979), reproduces the only known extant photographs and discusses them; Alexander L. Taylor, *The White Knight: A Study of C.L. Dodgson* (1952); Roger Lancelyn Green's "Bodley Head Monograph," *Lewis Carroll* (1960); and Jean Gattegno, *Lewis Carroll* (1970), in French.

For bibliography, see *The Lewis Carroll Handbook*, by S.H. Williams and Falconer Madan (1931 and rev. by Roger Lancelyn Green in 1962); and Edward Lewis Guiliano, *Lewis Carroll: An Annotated International Bibliography 1960-1977* (1981); for collections of his works, see the so-called *Complete Works of Lewis Carroll*, ed. by Alexander Woollcott (1937); and the fuller, but still not complete, *The Works of Lewis Carroll*, ed. by Roger Lancelyn Green (1965). For special editions of the two *Alice* books, see *The Annotated Alice*, ed. by Martin Gardner (1960); and *Alice*, in the "Oxford English Novels Series," ed. by Roger Lancelyn Green (1971). The manuscript of *Alice's Adventures Underground*, originally given to Alice Liddell, is now in the British Museum; so also are the surviving volumes of his *Diary*. No other major work seems to be extant in manuscript, but the four family magazines and miscellaneous juvenilia and mathematical and logical items are scattered among various collections, mainly in the United States. One of the magazines was published as *The Rectory Magazine* (1976) in facsimile.

Carrollton, city, seat (1829) of Carroll county, western Georgia, U.S., near the Little Tallapoosa River. Formerly called Troupsville, it was renamed (1829) for the Maryland patriot Charles Carroll. It developed as a trade and processing centre for surrounding fertile farmland and has a growing industrial base manufacturing textiles and wire and metal products. Carrollton is the seat of West Georgia College (1933), a branch of the University System of Georgia. Inc. 1856. Pop. (1990) 16,029.

carrot (*Daucus carota*), herbaceous, generally biennial plant of the Apiaceae family that produces an edible taproot. Among common varieties root shapes range from globular to long, with lower ends blunt to long-pointed. Besides the orange-coloured roots, white-, yellow-, and purple-fleshed varieties are known.

Carrot (*Daucus carota*)
Kenneth and Brenda Formanek—EB Inc

The carrot is native to Afghanistan and neighbouring lands. Wild carrot has become distributed as a weed in Europe, the United States, and other temperate lands. Carrots were cultivated in the Mediterranean region before the Christian Era and in China and northwestern Europe by the 13th century. They are now extensively grown throughout the temperate zones. In the 20th century, knowledge of the value of carotene (provitamin A) has increased appreciation of the carrot, a rich source of the nutrient.

The plants require cool to moderate temperatures and are not grown in summer in the warmer regions. They require deep, rich, but loosely packed soil. Modern machines sow the seeds thinly in bands to give room for plant development without need for thinning. An erect rosette of doubly compound, finely divided leaves develops above ground normally in the first season. The edible carrot and attached roots are below. After a rest period at temperatures near freezing, large, branched flower stalks arise. The ends of the main stalk and branches bear large compound umbels of tiny white or pinkish flowers. The seeds are one-seeded halves of small spiny fruits called schizocarps. Seeds as purchased for planting have the spines removed.

Fresh carrots should be firm and crisp, with smooth and unblemished skin. Bright-orange colour indicates high carotene content; smaller types are the most tender. Carrots are used in salads and as relishes and are served as cooked vegetables and in stews and soups.

Carrucci, Jacopo: see Pontormo, Jacopo da.

carrying capacity, the maximum number of animals of one or more species that can be supported by a particular habitat or area through the most unfavourable period of the year. The carrying capacity is different for each species in a habitat because of that species' particular

food, shelter, and social requirements and because of competition from other species that may have similar requirements.

Carson (of Duncairn), Edward Henry Carson, Baron (b. Feb. 9, 1854, Dublin—d. Oct. 22, 1935, Minster, Kent, Eng.), lawyer and politician known as the "uncrowned king of Ulster," who successfully led northern Irish resistance to the British government's attempts to introduce Home Rule for the whole of Ireland.

Although Carson was to become the champion of the northern province, he was born into a Protestant family in southern Ireland and was reared and educated there. Early in his Irish legal career (from 1877), he came to mistrust the Irish nationalists. As senior crown prosecutor for Dublin, he sternly enforced the Crimes Act of 1887, securing numerous convictions for violence against Irish estates owned by English absentee landlords. Appointed Irish solicitor general in 1892, he was elected to the British House of Commons in the same year, was called to the English bar in 1893, and served as British solicitor general from 1900 to 1905. During these years Carson achieved his greatest success as a barrister. In 1895 his cross-examination (in his role as queen's counsel) of Oscar Wilde largely secured the Irish writer's conviction for homosexuality.

On Feb. 27, 1910, Carson accepted the parliamentary leadership of the anti-Home Rule Irish Unionists and, forfeiting his chance to lead the British Conservative Party, devoted himself entirely to the Ulster cause. His dislike of southern Irish separatism was reinforced by his belief that the heavy industry of Belfast was necessary to the economic survival of Ireland. The Liberal government (1908–16) under H.H. Asquith, which in 1912 decided to prepare a Home Rule bill, could not overcome the effect of Carson's obstructionist speeches in Commons. The covenant of resistance to Home Rule, signed by Carson and other leaders in Belfast on Sept. 28, 1912, and afterward by thousands of Ulstermen, was followed by his establishment of a provisional government in Belfast in 1913. Early in that year he recruited a private Ulster army that openly drilled for fighting in the event that the Home Rule Bill was enacted. In preparation for a full-scale civil war, he successfully organized the landing of a large supply of weapons from Germany at Larne, County Antrim, on April 24, 1914. The British government, however, began to make concessions to the northern Irish, and in July 1914 Carson agreed to Home Rule for Ireland apart from Ulster (effected in 1921).

Appointed attorney general in Asquith's wartime coalition ministry on May 25, 1915, Carson resigned on October 19 because of his dissatisfaction with the conduct of the war. In David Lloyd George's coalition ministry (1916–22) he was first lord of the Admiralty (Dec. 10, 1916, to July 17, 1917) and then a member of the war Cabinet as minister without portfolio (to Jan. 21, 1918). Accepting a life peerage, he served from 1921 to 1929 as lord of appeal in ordinary.

The Life of Lord Carson, 3 vol. (1932–36), was written by Edward Marjoribanks and Ian Colvin. A later biography is *Carson* (1953), by H. Montgomery Hyde.

Carson, Kit, byname of CHRISTOPHER CARSON (b. Dec. 24, 1809, Madison County, Ky., U.S.—d. May 23, 1868, Ft. Lyon, Colo.), American frontiersman, trapper, soldier, and Indian agent whose contributions to westward expansion in the United States rank him among the nation's great folk heroes.

At 15 Carson ran away from his home in Missouri to join a caravan of traders bound for Santa Fe. From experienced frontiersmen he learned fur trapping and trading, a career he pursued for 15 years.

A chance encounter in 1842 with the explorer John C. Frémont made Carson an active participant in the clash of empires that eventually

Kit Carson

By courtesy of the Library of Congress, Washington, D.C.

extended the boundaries of the continental United States to its present size (Alaska excluded). He served as a guide to Frémont's government-financed explorations of the West in 1842 and 1843–44, and he was with him in California at the conclusion of the third expedition in 1846, when Frémont provoked the uprising generally known as the Bear Flag Revolt. En route to Washington, D.C., carrying dispatches from Frémont, Carson met Gen. Stephen W. Kearny, who pressed him into service as a guide for his command headed for California with presidential orders to take over the region for the United States. From then until the end of the war with Mexico (1848) Carson alternated fighting and guiding with dispatch-bearing to Washington, where his reputation for bravery, loyalty, and devotion to duty won for him many friends in high office.

Even though he was a noted Indian fighter, his fairness and his sympathy for the plight of the Indian made him an ideal choice for his duties as Indian agent at Taos in March 1854. But by 1861 he was back in the field to serve the cause of the Union in the U.S. Civil War in the Southwest, becoming Colonel Carson of the 1st New Mexico Volunteers. He was appointed superintendent of Indian affairs for Colorado Territory in January 1868, a position he held at the time of his death.

Carson's name is preserved variously throughout the Southwest, including Nevada's capital at Carson City; Ft. Carson, Colo.; and Carson Pass in California.

Carson, Rachel (Louise) (b. May 27, 1907, Springdale, Pa., U.S.—d. April 14, 1964, Silver Spring, Md.), U.S. biologist well known for her writings on environmental pollution and the natural history of the sea.

Carson received her M.A. from Johns Hopkins University in 1932 and did postgraduate work at Woods Hole Marine Biological Laboratory. A deep interest in wildlife from her childhood led Carson to a long career with the U.S. Bureau of Fisheries, later the U.S. Fish and Wildlife Service. In 1951 she published *The Sea Around Us*, which won the National Book Award. Her prophetic *Silent Spring* (1962) created a worldwide awareness of the dangers of environmental pollution. Among her other works are *Under the Sea-Wind* (1941) and *The Edge of the Sea* (1955).

Carson City, capital of Nevada, U.S., in Eagle Valley near the eastern foothills of the Sierra Nevada Range, 30 mi (48 km) south of Reno and 14 mi east of Lake Tahoe. Founded in 1858 on the site of Eagle Station (later Eagle Ranch), it was renamed for Christopher ("Kit") Carson, the frontiersman. It was made the seat of Carson county, Utah Territory, on March 1, 1861, a day before the Territory

of Nevada was created by the U.S. Congress. On Nov. 25, 1861, Carson City became the territorial capital and on November 29 was

State Capitol, Carson City, Nev.

Donald Dondoro

made county seat of the newly designated Ormsby county. When Nevada acquired statehood in 1864, Carson City became the seat of the new state government. In 1969 Carson City and Ormsby county were consolidated to form one governmental unit, the city and county of Carson City.

Mormon agriculturists settling in the area influenced the city's development, as did wagon and stage routes over the nearby Sierra Nevada passes into California. In 1859 discovery of silver in the Virginia City area, 15 miles (24 km) northeast, rapidly stimulated Carson City's economy. At nearby Empire, on the Carson River, mills treated the ore of the Comstock Lode (one of the world's richest deposits), brought down from Virginia City by the Virginia and Truckee Railroad, which maintained extensive shops at Carson City. Along with the Comstock, the railroad declined and was abandoned in 1950. To coin the immense silver output of the Comstock, the federal government established a mint at Carson City, which later became the Nevada State Museum.

Mining (copper and some silver) is still an economic factor. Livestock raising, tourism, government business, and legalized gambling are the economic mainstays. The Nevada State Capitol (1871) houses a collection of historic exhibits. Western Nevada Community College was established there in 1971. Inc. 1875. Pop. (2000) 52,457.

Carson River, river formed by headstreams in the Sierra Nevada, California, U.S. The Carson flows 125 miles (200 km) northeast into western Nevada, where it disappears into the Carson Sink. Together with the Truckee and Walker rivers, the Carson serves extensive irrigation and reclamation projects; its lower course is dammed for power and irrigation.

Carstares, William, Carstares also spelled CARSTAIRS (b. Feb. 11, 1649, Cathcart, near Glasgow, Scot.—d. Dec. 28, 1715, Edinburgh), Presbyterian minister and leader of the Scottish church at the time of the Revolution Settlement.

Carstares was ordained in exile in Holland. During the reign of Charles II he was twice arrested for subversive activities in England and Scotland. At the time of the Rye House plot, an unsuccessful attempt to overthrow Charles,

he confessed his complicity under torture in Edinburgh but was allowed to return to Holland, where he became minister to an English-speaking congregation at Leiden (1685) and chaplain to Prince William of Orange. After William's accession to the English throne (the Settlement of 1688), Carstares headed the Church of Scotland and University of Edinburgh. Later he advised Queen Anne on the treaty uniting Scotland and England (1707) and successfully maintained the independent Presbyterian nature of the Church of Scotland.

Carstens, Asmus Jacob, Asmus Jacob also spelled ERASMUS JAKOB (b. May 10, 1754, Sankt Jürgen, near Schleswig, Den.—d. May 25, 1798, Rome [Italy]), portrait and historical painter of the German Neoclassical school who did much to infuse a classical spirit into the arts of the late 18th century.

Carstens studied at Copenhagen Academy (1776–83) but was largely self-educated. He went to Italy in 1783, where he was impressed by Leonardo da Vinci's "Last Supper" and Giulio Romano's frescoes in the Palazzo del Te in Mantua. He went to Berlin in 1787 and within three years became a professor at the Academy there. In 1792 he moved to Rome on a grant from the Prussian state to study fresco painting. There he was inspired by the works of Raphael and Michelangelo and strove for a noble and monumental style depicting classical themes.

Carstens often used scenes from Greco-Roman mythology as his themes. His subjects were taken from Homer, Pindar, Dante, and Shakespeare, among others. His public exhibition in Rome in 1795 of such paintings as "Night with Her Children Sleep and Death" (1795) drew critical acclaim and gained him so many supporters that he remained there until his death.

Carstensz, Mount, also called GUNUNG CARSTENSZ (Indonesia); see Jaya, Mount.

cart, two-wheeled vehicle drawn by a draft animal, used throughout recorded history by numerous societies for the transportation of freight, agricultural produce, refuse, and people. The cart, usually drawn by a single animal, is known to have been in use by the Greeks and the Assyrians by 1800 BC (although it is generally assumed that such vehicles could have been used as early as 3500 BC as an extension of the invention of the wheel).

Carts have been made in several ways, with emphasis usually placed upon simplicity of construction. The shafts were frequently but extensions of the framework of the body, and, depending upon the nature of the load to be hauled, the body itself might simply consist of a few crossed wooden stakes or a sturdy box.

More recently, carts have been used as racing vehicles and for personal transport. Unlike the more primitive carts, these later vehicles were equipped with springs for the comfort of the rider.

Cartagena, capital of Bolívar *departamento*, northern Colombia, at the northern end of

The 17th-century fortress of San Felipe de Barajas, Cartagena, Colom.

Walter R. Aguilar—EB Inc

Cartagena Bay. The old walled sections, including the 17th-century fortress of San Felipe de Barajas, lie on a peninsula and the island of Getsemani, but the city now spreads over the islands of Manga and Manzanillo (site of the airport) and the mainland below La Popa Hill. In the old section are the ornate cathedral, the Church of San Pedro Claver (1603), the Palace of the Inquisition (1706), the main plaza, and the University of Cartagena (1827).

Founded in 1533, Cartagena de Indias gained fame after the mid-16th century when great fleets stopped annually to take on gold and other products of northern South America for convoy to Spain. The city became a centre for the Inquisition and a major slave market.

In 1811 the province of Cartagena declared its independence from Spain, and years of fighting followed. After falling into Spanish hands from 1815 to 1821, the city was recaptured by patriot forces. In the early national period, Cartagena continued as Colombia's leading port, but it was handicapped by inadequate connections with the interior. By the 1840s it had declined in population and commerce. In the 20th century it experienced renewed growth and is now Colombia's fifth largest city. Probably the most significant factor in Cartagena's revitalization was the opening of petroleum fields in the Magdalena River valley after 1917. The completion of the pipeline from Barrancabermeja to the Bahía de Cartagena in 1926, and the building of an oil refinery, helped make the city the country's chief oil port; platinum and coffee are other important exports. Manufactures include sugar, tobacco products, cosmetics, textiles, fertilizer, and leather goods. Tourism is of increasing importance. Pop. (1999 est.) 805,757.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Cartagena, port city, in the *provincia* and *comunidad autónoma* ("autonomous community") of Murcia, southeastern Spain, the site of Spain's chief Mediterranean naval base. Its harbour, the finest on the east coast, is a deep, spacious bay dominated to seaward by four hills crowned with forts and approached by a narrow entrance guarded by batteries. The outer bay is sheltered by Escombrera Island.

It was founded in the 3rd century BC on the site of an ancient Iberian settlement by the Carthaginian general Hasdrubal. After its capture by Publius Cornelius Scipio (later surnamed Africanus) in 209 BC, it flourished as the Carthago Nova of the Romans. In 425 it was pillaged by the Goths. Cartagena was a bishopric from about 400 to 1289, when the see was removed to Murcia. Under the Moors it became an independent principality, which was destroyed by Ferdinand II of Castile in 1243, restored by the Moors, and finally conquered by James I of Aragon in 1269. Its easily defended natural harbour lent itself to rebuilding, and in the 16th century Philip II made it a great naval port. It was a Republican naval base during the Spanish Civil War of 1936–39.

Parts of the old town wall remain, as does the ruined Castillo de la Concepción, built in the 12th century on Roman foundations; the city's archaeological museum contains Iberian, Greek, and Roman artifacts.

As a great commercial port, Cartagena was adversely affected during the early 20th century by the increasing importance of Barcelona, Málaga, and Alicante, all on the same coast. It exports some olive oil, dried fruits, minerals (lead, zinc, silver, iron, copper, sulfur), and esparto fibre. Fewer minerals were exported after the opening of an independent port in 1898 at Portman, a mining village on a sheltered bay 11 miles (18 km) east. Cartagena has, however, important smelting

works; its manufactures include glass and esparto fabrics. As a naval base, it has an arsenal and extensive dockyards. Pop. (1987 est.) city, 68,500; metropolitan area, 169,036.

Cartago, city, east-central Costa Rica. Lying at 4,720 feet (1,439 m) above sea level, the city is located on the fertile Central Plateau, at the foot of Irazú Volcano. Cartago was founded in 1563 and was the capital of Costa Rica until 1823. There are, however, no authentic colonial buildings since the town was attacked repeatedly by pirates during the 17th century and has also been damaged severely by earthquakes. The streets have been reconstructed along a grid pattern, and new buildings in colonial style have been erected. The Basilica

Basilica of Our Lady of the Angels, Cartago, Costa Rica
Ernst Jahm

of Our Lady of the Angels, patroness of Costa Rica, with a famous black Madonna, is a much-frequented place of pilgrimage. Nearby San José, the national capital, is accessible via the Pan-American Highway and the Costa Rica Railway. Pop. (1984) 23,928.

Cartan, Élie-Joseph (b. April 9, 1869, Dolomieu, France—d. May 6, 1951, Paris), French mathematician who greatly developed the theory of Lie groups and contributed to the theory of subalgebras.

In 1894 Cartan became a lecturer at the University of Montpellier, where he studied the structure of continuous groups introduced by the noted Norwegian mathematician Sophus Lie. He later examined theories of equivalence and their relation to the theory of integral invariants, mechanics, and the general theory of relativity. After he moved to the University of Lyon in 1896, he worked on linear associative algebra, developing general theorems based on the work of Benjamin Peirce of Harvard and exhibiting a subalgebra of the German mathematician Ferdinand Georg Frobenius. In 1912 Cartan became a professor at the Sorbonne, and a year later he discovered the spinors, complex vectors that are used to transform three-dimensional rotations into two-dimensional representations.

Although a profound theorist, Cartan was also able to explain difficult concepts to the ordinary student. Recognition of his work did not come until late in his life. He was made a member of the Academy of Sciences in France in 1931 and a fellow of the Royal Society of London in 1947. His works include *La Géométrie des espaces de Riemann* (1925; "The Geometry of Riemann Spaces") and *La Théorie des groupes continus et des espaces généralisés* (1935; "The Theory of Continuous Groups and Generalized Spaces").

Cartan, Henri (-Paul) (b. July 8, 1904, Nancy, France), French mathematician who made fundamental advances in the theory of analytic functions.

Son of the distinguished mathematician Élie Cartan, Henri Cartan began his academic career as professor of mathematics at the Lycée Caen (1928-29). He was appointed deputy professor at the University of Lille in 1929 and

two years later became professor of mathematics at the University of Strasbourg. In 1940 he joined the faculty of the University of Paris, where he remained until 1969, and from 1970 to 1975 he taught at Orsay.

In addition to his work on analytic functions, Cartan contributed to the theory of sheaves, homological theory, algebraic topology, and potential theory. His major works include *Homological Algebra* (1956) and *Elementary Theory of Analytic Functions of One or Several Complex Variables* (1963).

Carte, Richard D'Oyly (b. May 3, 1844, London, Eng.—d. April 3, 1901, London), English impresario remembered for having managed the first productions of Gilbert and Sullivan operas, for elevating his era's musical taste, and for contributing to the development of theatre technology.

Originally a composer, Carte became a music manager, representing the French composer Charles Gounod. After commissioning Gilbert and Sullivan to write *Trial by Jury* (1875), he formed the Comedy Opera Company Ltd. (1876) for the production of operettas, introducing to England works by Charles Lecocq and Jacques Offenbach. In 1881 he founded the Savoy Theatre, home of the popular Gilbert and Sullivan productions and London's first theatre to use electric lighting. In an attempt to establish serious opera, Carte built the Royal English Opera House (1887; now the Palace Theatre), for which Sullivan wrote *Ivanhoe* (1891). Despite subsequent commissions to other English composers (e.g., Sir Frederic Hymen Cowen), that enterprise collapsed. After Carte's death, the touring companies he established, known as the D'Oyly Carte Opera Company, continued to produce Gilbert and Sullivan works, with only a brief hiatus (1982-88) into the 21st century.

carte-de-visite, calling card, especially one with a photographic portrait of the bearer, which was immensely popular in the middle of the 19th century. The carte-de-visite was originated by the Parisian portrait photographer André-Adolphe-Eugène Disdéri (1819-90?). In 1854 he patented the four-lensed carte-de-visite camera, which made eight 3.25- by 2.25-inch (8.44- by 5.69-centimetre) negatives on one full-sized plate. The large print made from that plate was cut up, and the small, inexpensive portraits were separately mounted on cards measuring about 4 by 2.5 inches to serve as visitors' cards.

Uncut print from a carte-de-visite negative by André-Adolphe-Eugène Disdéri, c. 1860

George Eastman House Collection

The carte-de-visite became a fad after the French emperor Napoleon III posed for Disdéri. The carte-de-visite album became a common feature of Victorian parlours. During the American Civil War, Mathew B. Brady and other photographers did a booming business in them in Washington, D.C., and New York City. After the 1860s the fashion waned. The cartes of celebrities and royalty remain collector items.

cartel, association of independent firms or individuals for the purpose of exerting some form of restrictive or monopolistic influence on the production or sale of a commodity or group of commodities. The most common arrangements are aimed at regulating prices or output or dividing up markets. Members of a cartel maintain their separate identities and financial independence while engaging in common policies. Their common interest in exploiting the monopoly position that the combination helps to maintain is the source of the cartel's stability. Combinations of cartel-like form originated at least as early as the European Middle Ages, and some writers claim to have found evidences of cartels even in ancient Greece and Rome.

The main reason usually advanced for the establishment of cartels is for protection from "ruinous" competition, which, it is alleged, causes the entire industry's profits to be too low. Cartelization is said to provide for distributing fair shares of the total market among all competing firms. The most common practices employed by cartels in maintaining and enforcing their industry's monopoly position include the fixing of prices, the allocation of sales quotas or exclusive sales territories and productive activities among members, the guarantee of minimum profit to each member, and agreements on the conditions of sale, rebates, discounts, and terms.

Cartels result in a price to the consumer higher than the competitive price. Cartels may also maintain inefficient firms in an industry and prevent the adoption of cost-saving technological advances that would result in lower prices. Though a cartel tends to establish a high degree of price stability as long as it lasts, it is subject to conflicts of interest among its members; a breakdown of the cartel may lead to violent price fluctuations.

In Germany the cartel has been the most common form of monopolistic organization in modern times. German cartels are usually horizontal combinations of producers, firms that turn out competing goods; sometimes, however, they consist of so-called integrated enterprises, which range from the production of raw material to intermediate goods and to finished commodities; such combinations of firms constitute vertical integration. A strong impetus to form combinations came from German industry's increasing desire to dominate foreign markets in the decade before World War I. Tariff protection kept domestic prices high, enabling the firms to sell abroad at a loss.

During both world wars the German governments favoured cartels to facilitate the transition to a war economy. After World War II, cartels and other forms of restraint of trade were outlawed until the end of Allied occupation. Legislation that was adopted in 1957 forbade various forms of "restriction of competition" but exempted from control certain cartel agreements—e.g., export cartels.

International cartel agreements, normally among firms enjoying monopoly positions in their own countries, were first concluded in the period between World Wars I and II. Most such cartels, especially those in which German firms were partners, were dissolved during World War II, but some continued to exist. Later, some steps were taken in the chemical and allied fields to revive some of the old cartel agreements.

In the United States, cartels reached their maximum influence in the 1930s with examples such as the National Industrial Recovery Administration or the Agricultural Adjustment Act, which drove up prices by restricting the cultivation and distribution of certain crops. After the NRA was found unconstitutional in 1935, most government-sponsored

cartels ended, except in a few industries such as coal-mining, oil production, and agriculture.

The one exception to the rule that cartels break down when not enforced by government is the Organization of Petroleum Exporting Countries (OPEC). This cartel, which formed in the 1960s, became very effective in the 1970s, when it almost quadrupled the price of oil. Although the cartel agreements have broken down from time to time, few economists dispute that OPEC is still an effective cartel, charging, at some times, more than double what economists believe to be the competitive price of oil.

Carter FAMILY, singing group consisting of Alvin Pleasant Carter, known as A.P. Carter (b. April 15, 1891, Maces Spring, Va., U.S.—d. Nov. 7, 1960, Kentucky), his wife Sara, *née* Dougherty (b. July 21, 1898, Flatwoods, Va.—d. Jan. 8, 1979, Lodi, Calif.), and his sister-in-law Maybelle Carter, *née* Addington (b. May 10, 1909, Nickelsville, Va.—d. Oct. 23, 1978, Nashville, Tenn.), a leading force in the spread and popularization of Appalachian Mountain folk songs.

The family's recording career began in 1927 in response to an advertisement placed in a local newspaper by a talent scout for Victor records. Over the next 14 years, with two of Sara's children and three of Maybelle's (Helen, June, and Anita) also appearing, they recorded more than 300 songs for various labels, representing a significant cross section of the mountain-music repertory, including old ballads and humorous songs, sentimental pieces from the 19th and early 20th century, and many religious pieces. They later performed extensively on radio and popularized many songs that became standards of folk and country music; some of these were "Keep on the Sunny Side," "Will The Circle Be Unbroken," "Wabash Cannonball," "It Takes a Worried Man To Sing a Worried Song," and "Wildwood Flower."

After the Carter family's original group broke up in 1941, subsequent groups of one or more of the original members plus various relatives continued to perform under the Carter Family name. Maybelle ("Mother") Carter performed regularly with her daughters, and later with her son-in-law, the singer Johnny Cash. The Original Carter Family was the first group admitted to the Country Music Hall of Fame.

Carter, Elizabeth (b. Dec. 16, 1717, Deal, Kent, Eng.—d. Feb. 19, 1806, London), English poet, translator, and member of a famous group of literary "bluestockings" who gathered around Mrs. Elizabeth Montagu.

Carter was the daughter of a learned cleric who taught her Latin, Greek, and Hebrew. She was not a precocious child, but she persevered with an industry that affected her health,

Elizabeth Carter, portrait by Sir Thomas Lawrence; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

studying also French, German, Italian, Portuguese, Arabic, astronomy, ancient geography, ancient and modern history, and music, as well as the housewifery that caused Dr. Samuel Johnson to say "My old friend, Mrs. Carter, could make a pudding as well as translate Epictetus from the Greek, and work a handkerchief as well as compose a poem." Her *Poems upon Particular Occasions* were published in 1738 and *Poems on Several Occasions* in 1762. It was her translations, however, that ensured her reputation. In 1749 she undertook her most considerable work, a translation, *All the Works of Epictetus Which Are Now Extant*, published in 1758.

Carter, Elliott (Cook, Jr.) (b. Dec. 11, 1908, New York, N.Y., U.S.), American composer whose erudite style and novel principles of polyrhythm, called metrical modulation, won worldwide attention. He was twice awarded the Pulitzer Prize for music, in 1960 and 1973.

Born of a wealthy family, Carter was educated at Harvard University, where he first majored in English and later studied music under Walter Piston and Gustav Holst. His interest in music dated from his teens and was fostered by the composer Charles Ives, who was Carter's neighbour in 1924–25.

Elliott Carter, 1960

AP/Wide World Photos

Carter began composing seriously in 1933 while studying in Paris with Nadia Boulanger. His early works displayed an original diatonic style that was strongly influenced by the rhythmic and melodic patterns of Greek music and prose, reflecting Carter's interest in classical literature. Among his early works were choral and instrumental pieces and a ballet. His *First Symphony* dates from 1942, as does an especially representative work of this period, *The Defense of Corinth*, for narrator, men's chorus, and two pianos.

His *Piano Sonata* (1945–46) marked a turning point in Carter's stylistic development; in it he used a complex texture of irregularly cross-accented counterpoint within a large-scale framework. The *Cello Sonata* (1948) found the principles of metrical modulation well-established. The technique culminated in his *String Quartet No. 1* (1951). Both that quartet and the *String Quartet No. 2* (1959; Pulitzer Prize) became part of the standard repertory. The *Variations for Orchestra* (1954–55) marked another phase of Carter's development, leading to a serial approach to intervals and dynamics. The *Double Concerto* for harpsichord, piano, and two chamber orchestras (1961) won rare praise from Igor Stravinsky. The conflict generated between the two orchestral groups and the great difficulty of the concerto were mirrored in the *Piano Concerto* (1964–65). *Concerto for Orchestra* was first performed in 1970 and the *String Quartet No. 3* (Pulitzer Prize) in 1973. His *Brass Quintet* premiered in 1974, *Duo for Violin and Piano* in 1975, *A Mirror on Which to Dwell*, song cycle based on poems of Elizabeth Bishop, in 1975, and *A Symphony of Three*

Orchestras, inspired by Hart Crane's *The Bridge*, in 1977.

Carter, Howard (b. May 9, 1873, Swaffham, Norfolk, Eng.—d. March 2, 1939, London), British archaeologist who made one of the richest and most celebrated contributions to Egyptology: the discovery (1922) of the largely intact tomb of King Tutankhamen.

At the age of 17 Carter joined the British-sponsored archaeological survey of Egypt. He made (1893–99) drawings of the sculptures and inscriptions at the terraced temple of Queen Hatshepsut in ancient Thebes. He next served as inspector general of the Egyptian antiquities department. While supervising excavations in the Valley of the Tombs of the Kings in 1902, he discovered the tombs of Hatshepsut and Thutmose IV.

Around 1907 he began his association with the 5th earl of Carnarvon, a collector of antiquities who had sought out Carter to supervise excavations in the valley. On Nov. 4, 1922, Carter found the first sign of what proved to be Tutankhamen's tomb, and three days later he reached its sealed entrance. For the next 10 years Carter supervised the removal of its contents, most of which are housed in the Cairo Museum. He published *Thounnōsis IV* (1904) and *The Tomb of Tut-ankh-Amnen* (1923–33) with, respectively, P.E. Newberry and A.C. Mace. An account of the Tutankhamen excavation may be found in C.W. Ceram's *Gods, Graves, and Scholars* (2nd ed., 1967).

Carter, Jimmy, original name JAMES EARL CARTER, JR. (b. Oct. 1, 1924, Plains, Ga., U.S.), 39th president of the United States (1977–81).

The son of a peanut warehouseman and Georgia state legislator, Carter graduated from the U.S. Naval Academy at Annapolis in 1946. He served in the navy for seven years, five of them on submarines, working with Adm. Hyman G. Rickover on the nuclear submarine program. At his father's death in 1953 he resigned his commission and returned to Georgia to manage the family peanut farm operations. He won election as a Democrat to the Georgia State Senate in 1962 and was reelected in 1964. Carter won the governorship of Georgia in 1970. In his inaugural address he announced that "the time for racial discrimination is over" and opened Georgia's government offices to blacks and women. He reorganized the maze of state agencies and consolidated them into larger units with stricter budgets.

Carter announced his candidacy for the Democratic nomination for president in 1974, just before his term as governor ended. Though lacking a national political base or major backing, Carter managed through tireless and systematic campaigning to assemble a broad constituency whose votes enabled him to win the Democratic nomination in July 1976. Carter chose the liberal U.S. senator Walter F. Mondale of Minnesota as his running mate and defeated the incumbent Republican president, Gerald R. Ford, in November 1976.

During his administration, Carter tried to reinforce his image as a man of the people. He adopted an informal style of dress and speech in public appearances, held frequent press conferences, and reduced the pomp of the presidency. Carter's ambitious programs for social, administrative, and economic reform, however, met with opposition in Congress despite the Democratic majorities in both the House of Representatives and the Senate. By 1978 Carter's initial popularity had dissipated in the face of his inability to convert his ideas into legislative realities.

In foreign affairs, although Carter's championship of international human rights received prominent attention, his major achievements were on the more pragmatic level of patient diplomacy. In 1977 he obtained two treaties between the United States and Panama that

would give the latter control over the Panama Canal at the end of 1999 and would guarantee the neutrality of that waterway thereafter. On Jan. 1, 1979, Carter established full diplomatic relations between the United States and China and simultaneously broke official ties with Taiwan. In 1978 Carter brought Egyptian President Anwar el-Sādāt and Israeli Prime Minister Menachem Begin together at Camp David and secured their agreement to the Camp David Accords, which ended the state of war that had existed between the two countries since Israel's founding in 1948. The accords provided for the establishment of full diplomatic and economic relations between them on condition that Israel return the occupied Sinai Peninsula to Egypt. In 1979, also, Carter signed with Soviet leader Leonid Brezhnev in Vienna a new bilateral strategic arms limitation treaty (SALT II) that would establish parity in strategic nuclear weapons delivery systems between the two superpowers on terms that could be adequately verified. (Carter removed the treaty from consideration by the Senate in January 1980 after the Soviet Union invaded Afghanistan.)

Jimmy Carter, 1979
UPI/Bettmann Newsphotos

These substantial foreign policy successes were soon overshadowed by a serious crisis in foreign affairs and by a groundswell of popular discontent over Carter's economic policies. On Nov. 4, 1979, a mob of Iranian students stormed the U.S. embassy in Tehran and took the diplomatic staff there hostage. Their actions were soon sanctioned by Iran's revolutionary government, and a standoff developed between the United States and Iran over the issue of the captive diplomats. Carter's response was to temporize and try to negotiate the hostages' release while avoiding a direct confrontation with the Iranian government. This stance initially met with public approval, but by the time a secret U.S. military mission in April 1980 failed to rescue the hostages, Carter's inability to obtain the hostages' release had become a major political liability for him. He responded more forcibly to the Soviet Union's invasion of Afghanistan in 1979 when he placed an embargo on the shipment of American grain to that country and pressed for a U.S. boycott of the 1980 summer Olympics due to be held in Moscow.

On the home front, Carter's management of the economy was arousing widespread concern. The inflation rate had climbed higher each year since he took office, rising from 6 percent in 1976 to more than 12 percent by 1980. Unemployment remained high at 7.5 percent, and volatile interest rates reached a high of 20 percent or more twice during 1980.

Despite the apparent failure of his domestic reform and economic policies and the diplomatic crises of 1979, Carter won the Democratic presidential nomination in 1980. But public confidence in Carter's executive abilities had fallen to an irretrievable low, and in the elections held that November he was over-

whelmingly defeated by Republican nominee Ronald W. Reagan, winning only 41 percent of the popular vote.

Carter returned to his hometown and in 1982 published *Keeping Faith*, a volume of presidential memoirs. He also wrote *The Blood of Abraham: Insights into the Middle East* (1985). Carter and his wife, Rosalynn, established the Carter Presidential Center in Atlanta, Ga. The centre includes a presidential library and museum. Carter served as a sort of diplomat-without-portfolio in various conflicts in a number of countries—including Nicaragua (where he successfully promoted the return of the Miskito Indians to their homeland), Panama (where he observed and reported illegal voting procedures), and Ethiopia (where he attempted to mediate a settlement with the Eritrean People's Liberation Force). He was particularly active in this role in 1994, negotiating with North Korea to end nuclear weapons development there, with Haiti for a peaceful transfer of power, and with Bosnian Serbs and Muslims to broker a short-lived cease-fire. In 1995 he published a collection of poems titled *Always a Reckoning*. In 2002, Carter was invited to Cuba by Fidel Castro, becoming the first former U.S. president to visit that country since Castro came to power in 1959. During his visit Carter met with a number of dissidents who had been released from prison just prior to his visit. Carter pressed for greater liberty in Cuba.

In addition to his peace negotiations, Carter acted as an election observer in a large number of countries worldwide. He also worked with Habitat for Humanity International, through the Jimmy Carter Work Project. Beginning in 1997, Carter and his wife have devoted a week a year to building affordable housing for the poor. This continuing dedication to social justice and human rights led to his being awarded the 2002 Nobel Prize for Peace. The award was also a nod to Carter's role in the Camp David Accords; Carter would have been awarded the prize in 1978, along with Anwar el-Sādāt and Menachem Begin, but his nomination was not received in time by the committee.

Carteret, Sir George, BARONET (b. c. 1610, probably Jersey, Channel Islands, Eng.—d. January 1680, New Jersey [U.S.]), British Royalist politician and colonial proprietor of New Jersey.

A British naval officer and lieutenant governor of Jersey, Carteret made the island a Royalist stronghold during the English Civil Wars and privateered in the Stuart cause, thereby winning a knighthood (1644) and a baronetcy (1645). After the capture of the island by a Parliamentary force in 1651, he went into exile in France, where he served in the French navy, but he returned to England at the Restoration (1660). There he became a powerful administrator and legislator. Censured by Parliament for laxity in account keeping, he gave up the naval treasury in 1667.

In 1663 Carteret was one of the eight original proprietors to whom King Charles II granted the area of Carolina in North America. The following year he received property rights to half of New Jersey, named for his birthplace in his honour. Friction in the colony and disappointing financial returns led the other owner, John Berkeley, 1st Baron Berkeley of Stratton, to sell out to the Quakers in 1674. With them Carteret agreed upon a division of the colony in 1676; he kept East Jersey, which his heirs sold to William Penn and other Quakers two years after his death.

Cartesianism, the philosophical and scientific traditions derived from the writings of the French philosopher René Descartes.

A brief treatment of Cartesianism follows. For full treatment, see MACROPAEDIA: Cartesianism, Descartes and.

Descartes is considered to be the father of

modern philosophy in that he decisively broke with the basic philosophical assumptions of Scholastic philosophy, derived from the works of Aristotle and St. Thomas Aquinas, which had dominated European thought throughout the later medieval period. Descartes put at the centre of philosophical concern two related problems: first, whether a form of human knowledge that is immune to all skepticism is possible; and second, whether one can make sense of the nature of mind and its relationship to matter. These have remained central problems in Western philosophy and can be said to permeate systems of thought that are not normally described as Cartesian.

Cartesians have generally supported Descartes's central doctrines—namely, that reality can be divided into mind, the essence of which is thinking, and matter, the essence of which is extension in three dimensions; that the ideas of God, mind, and matter are innate and are not derived from experience; and that the correct method in arriving at philosophical truth is to doubt everything until one can find a proposition or idea that is indubitable, clear, and distinct. Most of Descartes's followers agreed also with Descartes in believing that there was at least one such proposition, namely the individual's recognition that he is thinking and that therefore he exists: *Cogito, ergo sum* ("I think, therefore I am").

Most Cartesians believed that from this single indubitable truth one could refute skepticism and build a system of philosophy and science that depended on human reason alone.

But almost immediately Cartesian philosophy was faced with a challenge to one of its central doctrines about the duality of mind and matter. If, as Descartes maintained, mind and matter are distinct, how is any interaction possible between them? One of the most important thinkers in the Cartesian tradition, Nicolas Malebranche, attempted to solve this problem by arguing that indeed mind and matter cannot interact because they are distinct. But he explained that when human beings believe that certain mental acts cause certain bodily actions, it is because on every such occasion God causes their physical actions to correspond to their mental acts and vice versa. This doctrine became known as Occasionalism.

Critics also argued that if causal interaction between the mind and the body and between mind and matter in general does not take place, then the mind cannot have direct experience of the external world. This leaves open the possibility that one might have ideas about the external world which do not correspond at all to the real external world. One solution to this problem was to assert that only the existence of an omnipotent, benign, and constantly watchful God could ensure that one's ideas about reality and reality itself were in harmony. This weakened the greatest intellectual appeal of the Cartesian system—its claim to have developed a philosophical and scientific system that was based entirely on human reason.

Other features of the Cartesian system—in particular the notion that animals are mere machines and that after death, when the connection between the mind and the body is broken, the mind, or soul, has no memory of individuals, thus making the reunion of loved ones impossible—helped to make the Cartesian system increasingly unpopular in the late 17th century. Continued Cartesian-inspired attacks on Scholastic philosophy even led to the Roman Catholic church banning the teaching of Cartesianism.

By the later 17th century the Cartesian metaphysical system had lost much of its appeal. However, the exploration of the relationship between mind and matter has remained an important legacy of Cartesianism, as has the

search for a philosophical method that involves no metaphysical or religious presuppositions. The status of Descartes's argument "I think, therefore I am" has prompted interesting discussions, such as whether this proposition, using language as it does, itself presupposes the existence of a community of speakers.

In recent years the American linguist Noam Chomsky has given new currency to Descartes's view that central ideas must be innate, arguing that only the existence of innate mental structures can explain how children quickly develop the ability to generate an infinite number of new, semantically correct sentences, most of which they have not encountered before.

Beyond these specific philosophical topics Cartesianism has remained an important, pervasive influence on Western philosophy, stressing as it does the importance of the quest for certainty based on reason alone, and the supreme virtue of mental and linguistic clarity.

Carthage, Phoenician KART-HADASHT, Latin CARTHAGO, great city of antiquity, traditionally founded on the north coast of Africa by the Phoenicians of Tyre in 814 BC. It is now a residential suburb of the city of Tunis. Its Phoenician name means New Town.

A brief treatment of ancient Carthage follows. For full treatment, see MACROPAEDIA: North Africa: *History*.

Various traditions concerning the foundation of Carthage were current among the Greeks, who called the city Karchedon; but the Roman tradition is better known because of the *Aeneid*, which tells of the city's foundation by the Tyrian princess Dido, who fled from her brother Pygmalion (the name of a historical king of Tyre). The inhabitants were known to the Romans as Poeni, a derivation from the word Phoenikes (Phoenicians), from which the adjective Punic is derived.

The date of the foundation of Carthage was probably exaggerated by the Carthaginians themselves, for it does not agree with the archaeological data. Nothing earlier than the last quarter of the 8th century BC has been discovered, a full century later than the traditional foundation date.

The site chosen for Carthage in the centre of the shore of the Gulf of Tunis was ideal: the city was built on a triangular peninsula covered with low hills and backed by the Lake of Tunis with its safe anchorage and abundant supplies of fish. The site of the city was well protected and easily defensible. On the south the peninsula is connected to the mainland by a narrow strip of land. The ancient citadel, the Byrsa, was on a low hill overlooking the sea. Some of the earliest tombs have been found there, though nothing remains of Carthage's domestic and public buildings.

The standard of cultural life enjoyed by the Carthaginians was probably far below that of the larger cities of the classical world. Punic interests were turned toward commerce. In Roman times Punic beds, cushions, and mattresses were regarded as luxuries, and Punic joinery and furniture were copied. Much of the revenue of Carthage came from its exploitation of the silver mines of North Africa and southern Spain, begun as early as 800 BC.

From the middle of the 3rd century to the middle of the 2nd century BC, Carthage was engaged in a series of wars with Rome. These wars, which are known as the Punic Wars (*q.v.*), ended in the complete defeat of Carthage by Rome. When Carthage finally fell in 146 BC, the site was plundered and burned, and all human habitation there was forbidden.

In 122 BC the Roman Senate entrusted Gaius Gracchus and Marcus Fulvius Flaccus with the foundation of a colony on the site

of Carthage. Though the venture was unsuccessful, Julius Caesar later sent a number of landless citizens there, and in 29 BC Augustus centred the administration of the Roman province of Africa at the site. Thereafter it became known as Colonia Julia Carthago, and it soon grew prosperous enough to be ranked with Alexandria and Antioch. Carthage became a favourite city of the emperors, though none resided there. Of its history during the later empire very little is known, but from the mid-3rd century the city began to decline.

From the end of the 2nd century it had its own Christian bishop, and among its luminaries were the Church Fathers Tertullian and St. Cyprian. Throughout the 4th and 5th centuries Carthage was troubled by the Donatist and Pelagian controversies.

In AD 439 the Vandal ruler Gaiseric entered almost unopposed and plundered the city. Gelimer, the last Vandal king, was defeated at nearby Decimum by a Byzantine army under Belisarius, who entered Carthage unopposed (AD 533). Carthage, after its capture by the Arabs in 705, was totally eclipsed by the new town of Tunis.

Though Roman Carthage was destroyed, much of its remains can be traced, including the outline of many fortifications and an aqueduct. The former Byrsa area was adorned with a large temple dedicated to Juno, Jupiter, and Minerva, and near it stood a temple to Asclepius. Also on the Byrsa site stood an open-air portico, from which the finest Roman sculptures at Carthage have survived. Additional remains of the Roman town include an odeum, another theatre constructed by Hadrian, an amphitheatre modeled on the Roman Colosseum, numerous baths and temples, and a circus.

The Christian buildings within the city, with the exception of a few Vandal structures, are all Byzantine. The largest basilica was rebuilt in the 6th century on the site of an earlier one. Churches probably existed during the 3rd and 4th centuries, but of these no traces remain.

Carthage, city, seat of Hancock county, western Illinois, U.S., near the Mississippi River. Laid out in 1833 and named for the ancient North African city, the community was hostile to the Mormons who had settled at nearby Nauvoo. On June 27, 1844, Joseph Smith, the founder of Mormonism, and his brother Hyrum, who were in the Carthage City Jail awaiting trial on charges of treason, were shot to death by a mob that stormed the building. This act elevated Smith to martyrdom, and the jail is preserved as a monument. The city is an agricultural trading centre and is the seat of Robert Morris (junior) College (1965). Inc. 1837. Pop. (1990) 2,657.

Carthage, city, seat of Jasper county, southwestern Missouri, U.S. It lies along Spring River, just east of Joplin. Established in 1842, it was named for ancient Carthage. During the Civil War, it was a centre of border warfare and was destroyed by Confederate guerrillas in 1863; it was rebuilt in 1866. Carthage is an agricultural-trade centre (fruits, small grains, dairy products) and is noted for its gray-marble quarries; diversified manufactures include clothing, shoes, spring wire products, and explosives. The stages of the Civil War Battle of Carthage (July 5, 1861) are indicated by historic markers. Carthage was the birthplace of Belle Starr, a woman outlaw who joined Confederate guerrilla leader William C. Quantrill's bushwhackers. Inc. city, 1873. Pop. (1990) 10,747.

Carthage, Exarchate of, semiautonomous African province of the Byzantine Empire, centred in the city of Carthage, in North Africa. It was established in the late 6th century by the Byzantine emperor Maurice (reigned 582–602) as a military enclave in Byzantine territory occupied largely by African Berbers.

The exarch (governor), appointed by the emperor, was endowed with unlimited military and civil power but was expected to represent and enforce imperial policies. Though a military governor, he did not immediately replace all the civil officials; they continued to function much as they had before but now acted under the exarch's orders.

Such an office presented the emperor with a potential rival. In 610 the ruthless domestic practices and weak foreign policy of the emperor Phocas (reigned 602–610) were challenged by the Exarch of Carthage. An African fleet commanded by the exarch's son, Heraclius, sailed to Constantinople. Receiving the support of the masses, he overthrew Phocas and ascended the throne to form a new dynasty.

The Exarchate of Carthage successfully repulsed Arab attacks in the early 7th century, but it succumbed in 697–698. It has been viewed as the beginning of the Byzantine theme (province or district) organization, utilized from the 7th century as a means of provincial administration.

Carthaginian Wars: see Punic Wars.

Carthusian, member of ORDER OF CARTHUSIANS (O.Cart.), an order of monks founded by St. Bruno of Cologne in 1084 in the valley of Chartreuse, north of Grenoble, Fr. The Carthusians, who played an important role in the monastic-reform movement of the 11th and 12th centuries, combine the solitary life of hermits with a common life within the walls of a monastery. The monks live in individual cells, where they pray, study, eat, and sleep, gathering in the church only for the night office, morning mass, and afternoon vespers. They eat together on Sundays and at great feasts, when they also have a period of conversation; and once a week they take a long walk together. The monks wear hair shirts and practice total abstinence from meat, and, on Fridays and other fast days, they take only bread and water. The lay brothers' life is also strictly ordered but is lived in community. At the Grande Chartreuse, as the motherhouse is known, the lay brothers distill the liqueur that bears the name of the motherhouse and of which the profits are distributed to neighbouring religious causes and charities. Carthusian nuns, with a few monasteries in France and Italy, are also strictly cloistered and contemplative. The Carthusians spread slowly, but, by 1521, the order numbered 195 houses in every country of Catholic Europe. Vocations to Carthusian solitude are rare; it is the one form of communal religious life that has never required and never experienced reform.

Cartier, Sir George Étienne, BARONET (b. Sept. 6, 1814, St. Antoine, Lower Canada [now Quebec]—d. May 20, 1873, London), statesman, Canadian prime minister jointly with Sir John Macdonald (1858–62), and promoter of federation and the improvement of Anglo-French relations in Canada.

Cartier practiced as a lawyer until 1837, when he took part in the rebellion that sent

George Étienne Cartier, 1867
By courtesy of the Public Archives of Canada

him into several months of exile in the United States. Elected as a Liberal to the Canadian Legislative Assembly in 1848, he was appointed provincial secretary in 1855 and two years later attorney general for Canada East (formerly Lower Canada).

His alliance with Macdonald, in which Cartier represented Canada East, developed the Liberal-Conservative Party in Canada. He promoted many useful measures, including the abolition of seigneurial tenure (estates held by feudal tenure) in Canada East and the codification of civil law. He was involved with the building of the Grand Trunk Railway through eastern Canada and the resolve to build the Canadian Pacific Railway. Despite great opposition, he carried his native province into federation by 1867, and he was created a baronet of the United Kingdom the following year.

As minister of militia and defense in Macdonald's first Confederation Cabinet, Cartier reformed the nation's military land forces, but a political disagreement with the Roman Catholic church brought his defeat in the 1872 election. Another seat was found for him, but he died before he could serve.

Cartier, Jacques (b. 1491, Saint-Malo, Brittany, France—d. Sept. 1, 1557, near Saint-Malo), French mariner, whose explorations of the North American coast and the St. Lawrence River (1534, 1535, 1541–42) laid the basis for later French claims to Canada. He appears also to have voyaged to Brazil.

When King Francis I of France decided in 1534 to send an expedition to explore the northern lands in the hope of discovering gold, spices, and a passage to Asia, Cartier received the commission.

Cartier sailed from Saint-Malo on April 20, 1534, with two ships and 61 men; he explored the Gulf of St. Lawrence as far as Anticosti Island, then seized two Indians at Gaspé and sailed back to France. His report piqued the curiosity of Francis I sufficiently for him to send Cartier back the following year, with three ships and 110 men, to explore further. Guided by the two Indians he had brought back, he sailed up the St. Lawrence as far as Quebec and established a base near an Iroquois village. In September he proceeded with a small party as far as the island of Montreal, where navigation was barred by rapids. He was warmly welcomed by the resident Iroquois, but he spent only a few hours among them before returning to winter at his base. He had, however, learned from the Indians that two rivers led farther west to lands where gold, silver, copper, and spices abounded.

The severity of the winter came as a terrible shock, Quebec being farther south than Paris and no Europeans since the Vikings having wintered that far north on the American continent. Scurvy claimed 25 of Cartier's men. To make matters worse, the explorers earned the enmity of the Iroquois. Thus, in May, as soon as the river was free of ice, they treacherously seized some of the Iroquois chiefs and sailed for France. Cartier was able to report only that great riches lay farther in the interior and that a great river, said to be 800 leagues (about 2,000 miles [3,200 kilometres]) long, possibly led to Asia.

War in Europe prevented Francis I from sending another expedition until 1541. This time, to secure French title against the counterclaims of Spain, he commissioned a nobleman, Jean-François de La Rocque de Roberval, to establish a colony in the lands discovered by Cartier, who was appointed Roberval's subaltern. Cartier sailed first, arriving at Quebec on August 23; Roberval was delayed until the following year. Cartier again visited Montreal, but as before he remained only a few hours and failed to go even the few miles necessary to get beyond the rapids. The subsequent maps based on the knowledge he

provided fail to indicate that he had reached a large island at the confluence of the Ottawa and St. Lawrence rivers.

The winter at his new base above Quebec proved as severe as the earlier one. Cartier appears to have been unable to maintain discipline among his men, and their actions again aroused the hostility of the local Indians. But what were thought to be gold and diamonds were found in abundance. In the spring, not waiting for Roberval to arrive with the main body of colonists, Cartier abandoned the base and sailed for France. En route he stopped at Newfoundland, where he encountered Roberval, who ordered him back to Quebec. Cartier, however, stole away during the night and continued back to France. There, his gold and diamonds were found to be dross. Roberval enjoyed no better success. After one winter he abandoned the plan to found a colony and returned to France. The disappointment at these meagre results was very great. Not for more than half a century did France again show interest in these new lands.

Cartier received no new commissions from the crown. He apparently spent his remaining years attending to his business affairs at his estate near Saint-Malo. His claim to fame rests on his exploration of the St. Lawrence River to the height of navigation. Yet his failure to proceed any farther (when it would have been easy to do so), his treacherous dealings with the Iroquois, and his leaving Roberval in the lurch detract somewhat from his stature.

(W.J.E.)

BIBLIOGRAPHY. The journals of Cartier's voyages, in original and translation, were edited by H.P. Biggar, *The Voyages of Jacques Cartier* (1924), as was *A Collection of Documents Relating to Jacques Cartier and the Sieur de Roberval* (1930). Bernard G. Hoffman, *Cabot to Cartier* (1961), critically examines the source material. The best account of Cartier's voyages is in Marcel Trudel, *Histoire de la Nouvelle-France: Les vaines tentatives 1524-1603* (1963). Briefer accounts, in English, are contained in J.B. Brebner, *The Explorers of North America* (1933); and W.J. Eccles, *The Canadian Frontier, 1534-1760* (1969).

Cartier-Bresson, Henri (b. Aug. 22, 1908, Chanteloup, France—d. Aug. 3, 2004, Céreste), French photographer whose humane, spontaneous photographs helped establish

Cartier-Bresson
Jean Marquis—Magnum

photojournalism as an art form. His theory that photography can capture the meaning beneath outward appearance in instants of extraordinary clarity is perhaps best expressed in his book *Images à la sauvette* (1952; *The Decisive Moment*).

Cartier-Bresson was born and attended

school in a village not far from Paris. In 1927–28 he studied in Paris with André Lhote, an artist and critic associated with the Cubist movement. Lhote implanted in him a lifelong interest in painting, a crucial factor in the education of his vision. In 1929 Cartier-Bresson went to Cambridge, where he studied literature and painting.

As a boy, Cartier-Bresson had been initiated into the mysteries of the simple "Brownie" snapshot camera. But his first serious concern with the medium occurred in about 1930, after seeing the work of two major 20th-century photographers, Eugène Atget and Man Ray. Making use of a small allowance, he travelled in Africa in 1931, where he lived in the bush, recording his experiences with a miniature camera. There, he contracted blackwater fever, necessitating his return to France. The portability of a small camera and the ease with which one could record instantaneous impressions must have struck a sympathetic chord, and in 1933 he purchased his first 35-millimetre Leica. The use of this type of camera was particularly relevant to Cartier-Bresson. It lent itself not only to spontaneity but to anonymity as well. So much did Cartier-Bresson wish to remain a silent, and even unseen, witness, that he covered the bright chromium parts of his camera with black tape to render it less visible, and he sometimes hid the camera under a handkerchief. The man was similarly reticent about his life and work.

In more than 40 years as a photographer, Cartier-Bresson wandered continually around the world. But there was nothing compulsive about his travels, and he expressed a desire to move slowly, to "live on proper terms" in each country, to take his time, so that he became totally immersed in the environment.

In 1937, the year of his marriage to Ratna Mohini, Cartier-Bresson produced a documentary film, his first, on medical aid in the Spanish Civil War. The date also marked his first reportage photographs made for newspapers and magazines. His enthusiasm for filmmaking was further gratified when, from 1936 to 1939, he worked as an assistant to the film director Jean Renoir in the production of *Une Partie de campagne* ("Picnic") and *La Règle du jeu* (*The Rules of the Game*). As a photographer he felt indebted to the great films he saw as a youth. They taught him, he said, to choose precisely the expressive moment, the telling viewpoint. The importance he gave to sequential images in still photography may be attributed to his preoccupation with film.

In 1940, during World War II, Cartier-Bresson was taken prisoner by the Germans. He escaped in 1943 and the following year participated in a French underground photographic unit assigned to record the German occupation and retreat. In 1945 he made a film for the U.S. Office of War Information, *Le Retour*, which dealt with the return to France of released prisoners of war and deportees.

Though Cartier-Bresson's photographs had been exhibited in 1933 in the prestigious Julien Levy Gallery in New York City, a more important tribute was paid to him in 1947, when a one-man exhibition was held in that city's Museum of Modern Art. In that same year, Cartier-Bresson, in partnership with the U.S. photographer Robert Capa and others, founded the cooperative photo agency known as Magnum Photos. The organization offered periodicals global coverage by some of the most talented photojournalists of the time. Under the aegis of Magnum, Cartier-Bresson concentrated more than ever on reportage photography. The following three years found him in India, China, Indonesia, and Egypt. This material and more, taken in the 1950s in Europe, formed the subjects of several books published between 1952 and 1956. Such

publications helped considerably to establish Cartier-Bresson's reputation as a master of his craft. One of them, and perhaps the best-known, *Images à la sauvette*, contains what is probably Cartier-Bresson's most comprehensive and important statement on the meaning, technique, and utility of photography. The title refers to a central idea in his work—the decisive moment—the elusive instant when, with brilliant clarity, the appearance of the subject reveals in its essence the significance of the event of which it is a part, the most telling organization of forms. His later books included *Cartier-Bresson's France* (1971), *The Face of Asia* (1972), and *About Russia* (1974).

He was singularly honoured by his own country in 1955, when a retrospective exhibition of 400 of his photographs was held in the Museum of Decorative Arts, Paris, and was then displayed in Europe, the United States, and Japan before the photographs were finally deposited in the Bibliothèque Nationale in Paris. In 1963 he photographed in Cuba; in 1963–64, in Mexico; and in 1965, India. The French filmmaker Louis Malle recalled that, during the student revolt in Paris, in May 1968, Cartier-Bresson was there with his 35-millimetre camera, but, despite the explosive activities, he took photographs at the rate of about four per hour.

In later years Cartier-Bresson diverted most of his interest to making motion pictures—including *Impressions of California* (1969) and *Southern Exposures* (1971). He believed that still photography and its use in pictorial magazines was, to a large extent, being superseded by television. On principle, he always avoided developing his own prints, convinced that the technical exigencies of photography were a harmful distraction. Similarly, he directed the shooting of films and did not wield the camera himself. With this medium, however, he was no longer able to work unobtrusively by himself.

His Leica—his notebook, as he called it—accompanied him wherever he went, and, consistent with his training as a painter, he always carried a small sketch pad. There was for Cartier-Bresson a kind of social implication in the camera. To his mind, photography provided a means, in an increasingly synthetic epoch, for preserving the real and humane world.

(A.Sc.)

BIBLIOGRAPHY. Collections of Cartier-Bresson's work may be found in the Bibliothèque Nationale, Paris; the Museum of Modern Art, New York City; and the George Eastman House, Rochester, N.Y. A useful bibliography and several essays are included in Lincoln Kirstein and Beaumont Newhall, *The Photographs of Henri Cartier-Bresson* (1947); in more recent editions the bibliography has been deleted. A selected bibliography appears in Nathan Lyons (ed.), *Photographers on Photography* (1966), which includes the complete text of Cartier-Bresson's essay from *Decisive Moment* (1952). No complete biography of Cartier-Bresson exists. There is a brief account of one of his U.S. tours in John Malcolm Brinnin, *Sextet* (1981). Beaumont Newhall, "The Instant Vision of Henri Cartier-Bresson," *Camera*, 34:485–489 (1955), is a valuable discussion of the photographer's equipment and manner of working. Cartier-Bresson's work is available in *The World of Henri Cartier-Bresson* (1968); and *Henri Cartier-Bresson: Photographer* (1992), among many other books.

cartilage, dense connective tissue forming the skeleton of mammalian embryos before bone formation begins and persisting in parts of the human skeleton into adulthood. Cartilage is the only component of the skeletons of certain primitive vertebrates, including lampreys and sharks. It is composed of a dense network of collagen fibres embedded in a firm, gelatinous ground substance that has the consistency of plastic; this structure gives the tissue tensile

strength, enabling it to bear weight while retaining greater flexibility than bone. Cartilage cells, called chondrocytes, occur at scattered sites through the cartilage and receive nutrition by diffusion through the gel; cartilage contains no blood vessels, unlike bone.

Three main types of cartilage can be distinguished. Hyaline cartilage is the most widespread and is the type that makes up the embryonic skeleton. It persists in human adults at the ends of bones in free-moving joints, at the ends of the ribs, and in the nose, larynx, trachea, and bronchi. It is a glossy blue-white in appearance and very resilient. Fibrocartilage is the tough, very strong tissue found predominantly in the intervertebral disks; it is similar to other fibrous tissues but contains cartilage ground substance. Yellow, or elastic, cartilage is more pliable than the other two forms because it contains elastic fibres in addition to collagen. In humans it makes up the external ear, the auditory tube of the middle ear, and the epiglottis.

A major role of cartilage in humans is to form a model for later growth of the bony skeleton. Only the clavicle, or collarbone, and some parts of the skull are not preformed in cartilage. In the embryo, the fibrous part of the cartilage gradually calcifies, and chondrocytes are replaced by bone cells, or osteocytes. After birth a thin plate of cartilage, called the epiphyseal plate, persists at the ends of growing bones, finally becoming ossified itself only when the bone behind it has completed its growth. At the growing edge of the plate, chondrocytes continue to grow and divide, while on the trailing edge they are replaced by osteocytes as new bone is laid down. The cartilage plate thus remains of a constant thickness while the bone grows behind it. Once this plate disappears, no further bone growth is possible. *See also* bone.

Cartimandua (fl. mid-1st century AD), queen of the Brigantes, a large tribe in northern Britain, whose rule depended upon support from the invading Roman armies.

After concluding a treaty with the emperor Claudius early in his conquest of Britain, which began in AD 43, Cartimandua was faced with a series of revolts by anti-Roman elements among her subjects. In 48, Roman forces intervened for the first time to help her quell these disturbances. Three years later the queen's forces arrested the leader of the British resistance, Caratacus, who had fled to Brigantium to rally support for his cause, and turned him over to the Romans. In so doing she assured continuation of Roman support. From 52 to 57, when her husband and coruler, Venutius, twice attempted to overthrow her by stirring up anti-Roman sentiment, the Roman legions put down the uprisings. Venutius and Cartimandua were reconciled and reigned together until 69, when she divorced him for his armour bearer, Vellocatus. For the third time Venutius rebelled and this time drove her from the throne. The Romans, preoccupied by the chaotic year of the four emperors, could do nothing until 71, when the new emperor Vespasian defeated the Brigantes under Venutius and annexed their territory. Silver coins minted during the reign of Cartimandua have survived.

Cartland, Dame Barbara, in full MARY BARBARA HAMILTON CARTLAND, married name BARBARA MCCORQUODALE (b. July 9, 1901, Edgbaston, Birmingham, Eng.—d. May 21, 2000, Hatfield, Hertfordshire), English author of more than 700 books, mostly formulaic novels of romantic love set in the 19th century.

After the death of her father in World War I, Cartland moved with her family to London. There she began contributing to the *Daily Express* newspaper, receiving instruction in writing from its proprietor, Lord Beaverbrook. Cartland's first novel, *Jigsaw* (1925), was a

popular success. She traveled widely and conducted historical research in order to write her novels, which usually feature beautiful, virginal young women and handsome, rakish young men. Her output of books grew steadily, averaging 23 a year from the mid-1970s; altogether, her works had sold more than one billion copies in some 35 languages by 2000. Her nonfiction includes five autobiographies and books of advice on health food, vitamins, and beauty. She also wrote film scripts for several of her novels and some 30 plays. In 1991 she was made Dame Commander of the Order of the British Empire.

cartographic projection: *see* projection.

cartography, the art and science of graphically representing a geographical area, usually on a flat surface such as a map or chart; it may involve the superimposition of political, cultural, or other nongeographical divisions onto the representation of a geographical area.

A brief treatment of cartography follows. For full treatment, *see* MACROPAEDIA: Mapping and Surveying.

Cartography is an ancient discipline that dates from the prehistoric depiction of hunting and fishing territories. The Babylonians mapped the world in a flattened, disk-shaped form, but Ptolemy established the basis for subsequent efforts in the 2nd century AD with an eight-volume work on geography that showed a spherical Earth. Maps produced during the Middle Ages followed Ptolemy's guide, but they used Jerusalem as the central feature and placed East at the top. These representations are often called T-maps because they show only three continents (Europe, Asia, and Africa), separated by the "T" formed by the Mediterranean Sea and the Nile River. More accurate geographical representation began in the 14th century when portolan (seamen's) charts were compiled for navigation.

The discovery of the New World led to the need for new techniques in cartography, particularly for the systematic representation on a flat surface of the features of a curved surface (*see* projection; Mercator projection). The 17th and 18th centuries saw a vast outpouring of printed maps of ever-increasing accuracy and sophistication. Noteworthy among the scientific methods introduced later was the use of the telescope for determining the length of a degree of longitude. Modern cartography largely involves the use of aerial photographs as a base for any desired map or chart; the procedures for translating photographic data into maps are governed by the principles of photogrammetry (*q.v.*) and yield a degree of accuracy previously unattainable. Satellite photography has made possible the mapping of features of the Moon and of several planets and their satellites.

cartoon, originally, and still, a full-size sketch or drawing used as a pattern for a tapestry, painting, mosaic, or other graphic art form, but also, since the early 1840s, a pictorial parody utilizing caricature, satire, and usually humour. Cartoons are used today primarily for conveying political commentary and editorial opinion in newspapers and for social comedy and visual wit in magazines.

A brief account of cartoons follows. For full treatment, *see* MACROPAEDIA: Caricature, Cartoon, and Comic Strip; for animated-motion-picture cartoons, *see* Motion Pictures: Animation.

While the caricaturist deals primarily with personal and political satire, the cartoonist treats types and groups in comedies of manners. Although William Hogarth had a few predecessors, it was his social satires and depictions of human foibles that later cartoons were judged against. Honoré Daumier anticipated the 20th-century cartoon's ballooned speech by indicating in texts accom-

panying his cartoons the characters' unspoken thoughts. Hogarth's engravings and Daumier's lithographs were fairly complete documentaries on the London and Paris of their times.

Thomas Rowlandson lampooned the ludicrous behaviour of a whole series of social types, including "Dr. Syntax," which may well be the grandfather of the later comic strips. Rowlandson was followed by George Cruikshank, a whole dynasty of *Punch* artists who humorously commented on the passing world. Edward Lear, Thomas Nast, Charles Dana Gibson, and "Spy" (Leslie Ward) and "Ape" (Carlo Pellegrini), the two main cartoonists of *Vanity Fair* magazine.

In the 20th century the one-line joke, or single-panel gag, and the pictorial joke without words matured and a huge diversity of drawing styles proliferated. The influence of *The New Yorker* magazine spread to other publications worldwide. The new cartoonists included James Thurber, Charles Addams, Saul Steinberg, Peter Arno, and William Hamilton of the United States and Gerard Hoffnung, Fougasse, Anton, and Emmet Rowland of England.

A Pulitzer Prize for editorial cartooning was established in 1922, and a Sigma Delta Chi Award for editorial cartooning was awarded annually after 1942; such cartoonists as Edmund Burck, Herblock, Bill Mauldin, and Rube Goldberg won both. Carl Giles was honoured with the Order of the British Empire in 1959 for his achievements in editorial cartooning.

cartouche, in architecture, ornamentation in scroll form, applied especially to elaborate

Cartouche from the Mellish Monument, Blyth Church, Nottinghamshire, England, c. 1733

frames around tablets or coats of arms; by extension, the word is applied to any oval shape or even to a decorative shield, whether scrolled or not. The term is also used for an oval frame enclosing the hieroglyphs of the name of an Egyptian sovereign, as well as for the amulet of similar design worn in ancient Egypt as a protection against the loss of one's name (*i.e.*, one's identity).

cartridge, in weaponry, unit of small-arms ammunition, composed of a metal (usually brass) case, a propellant charge, a projectile or bullet, and a primer. The first cartridges, appearing in the second half of the 16th century, consisted merely of charges of powder wrapped in paper; the ball was loaded separately. During the next century, methods of including the ball with the powder were devised. In muzzle-loading a musket, the soldier bit off the end of the paper cartridge, poured a small amount of the powder into the firing

pan, poured the rest down the barrel, and rammed the ball and paper down after it.

The breech-loading rifle and various multi-shot weapons of the 19th century made possible loading the entire cartridge as a unit; many varieties were developed, using paper, linen, animal tissue, collodion, metal, rubber, and other materials. All required an external spark to ignite the propellant. In 1847 a Paris gunsmith, B. Houllier, patented the first cartridge, capable of being fired by the blow of the gun's hammer. In one type, a pin was driven into the cartridge by the hammer action; in the other, a primer charge of fulminate of mercury was exploded in the cartridge rim. Later improvements changed the point of impact from the rim to the centre of the cartridge, where a percussion cap was inserted. The cartridge with a percussion cap, or cup, centred on the base of the cartridge—centre-fire—predominated in all larger calibres, but rimfire cartridges remain popular in small-bore, low-powered ammunition, *e.g.*, .22 calibre. Smokeless nitrocellulose powder replaced black powder as the propellant in the late 19th century.

Also in the 19th century, the round ball was replaced by the elongated, or cylindroconoidal, Minié ball, as it was commonly called, with a cavity in the base that expanded on explosion of the charge to engage the rifling threads in the gun barrel. Shotgun cartridges are made of paper or plastic instead of brass.

Cartwright, Alexander Joy (b. April 17, 1820, New York City—d. July 12, 1892, Honolulu), chief codifier of the baseball rules from which the present rules were developed.

A surveyor by profession, Cartwright was one of the founders of the Knickerbocker Base Ball Club, an organization of amateur players in New York City. He was chairman of a club committee that prepared a set of baseball rules, which were adopted in September 1845 and apparently were first used in a game between the Knickerbockers and the New York Nine at Hoboken, N.J., June 19, 1846.

Those 1845 rules were taken in part from Robin Carter's *Book of Sports* (1834), but were original in some important respects. A major innovation legitimized tagging out a base runner rather than hitting him with a thrown ball in order to retire him; this made possible the introduction of a hard ball. Cartwright is generally credited with fixing the distance between bases at 90 feet.

Cartwright, Edmund (b. April 24, 1743, Marnham, Nottinghamshire, Eng.—d. Oct. 30, 1823, Hastings, Sussex), English inventor

Edmund Cartwright, engraving by James Thomson

By courtesy of the Science Museum, London

of the first wool-combing machine and of the predecessor of the modern power loom.

Cartwright began his career as a clergyman, becoming, in 1779, rector of Goadby Marwood, Leicestershire; in 1786 he was a prebendary in Lincoln (Lincolnshire) cathedral. He probably would have spent his life as an obscure country clergyman had his attention not been turned to Sir Richard Ark-

wright's cotton-spinning mills at Cromford, Derbyshire, which he saw on a visit in 1784. Inspired to construct a similar machine for weaving, he invented a crude power loom, first patented in 1785. That same year he set up a weaving and spinning factory in Doncaster, Yorkshire, but had to surrender it to creditors in 1793. In 1789 he had patented a wool-combing machine; although it lowered manufacturing costs, it did not benefit Cartwright financially. In 1809, however, the House of Commons voted Cartwright £10,000 in recognition of benefits conferred on the nation through his power loom. His other inventions included a cordelier (machine for making rope; 1792) and a steam engine that used alcohol instead of water.

Cartwright, John, byname MAJOR CARTWRIGHT (b. Sept. 17, 1740, Marnham, Nottinghamshire, Eng.—d. Sept. 23, 1824, London), advocate of radical reform of the British Parliament and of various constitutional changes that were later incorporated into the People's Charter (1838), the basic document of the working class movement known as Chartism. His younger brother Edmund was the inventor of the power loom.

John Cartwright joined the Royal Navy about 1758, fought in the Seven Years' War (1756–63), and was promoted to first lieutenant in 1766. In ill health, he retired from the Navy shortly before the revolt (1775) of the North American colonies; he was one of England's earliest supporters of the colonists and in 1774 had published his first plea on behalf of the colonists, entitled *American Independence the Glory and Interest of Great Britain*. In 1775, when the Nottinghamshire Militia was first raised, he was appointed major, and in this capacity he served for 17 years. He was at last superseded because of his celebration of the French Revolution. In 1776 appeared his first work on reform in Parliament, entitled, *Take Your Choice*—a second edition appearing in 1777 under the new title of *The Legislative Rights of the Commonalty Vindicated*. The task of his life was thenceforth chiefly the attainment of universal suffrage and annual Parliaments. In 1778 he conceived the project of a political association, which took shape in 1780 as the Society for Constitutional Information. From this society sprang the more famous Corresponding Society. Major Cartwright was one of the witnesses at the high treason trial of his friends Horne Tooke, John Thelwall, and Thomas Hardy in 1794 and was himself indicted for conspiracy in 1819 and condemned to pay a fine of £100.

Cartwright, Peter (b. Sept. 1, 1785, Amherst County, Va., U.S.—d. Sept. 25, 1872, near Pleasant Plains, Ill.), Methodist circuit rider of the American frontier.

His father, a veteran of the Revolutionary War, took his family to Kentucky in 1790.

Peter Cartwright, detail from an engraving by F.E. Jones

By courtesy of the Commission on Archives and History, the United Methodist Church

There Cartwright had little opportunity for schooling but was exposed to the rude surroundings of the frontier, becoming a gambler at cards and horse racing. This way of life came to an abrupt end when he was converted during the Great Western Revival in 1801. He was received into the Methodist Episcopal Church in June and was soon licensed as an exhorter. In autumn 1802 he was commissioned to form a new circuit of preaching points in an unchurched wilderness around the mouth of the Cumberland River. He was ordained deacon in 1806 and elder in 1808. An able and vigorous speaker, Cartwright preached thousands of times in his more than 60 years as a frontier minister, defending Methodism and vehemently denouncing all other denominations.

Although not an abolitionist, Cartwright hated slavery; to be on free soil he moved in 1824 to Sangamon county, Ill. There he entered politics to oppose slavery and served several terms in the lower house of the Illinois general assembly. Cartwright recounted his colourful life in his *Autobiography* (1856), which became a leading source for material on the life of the western circuit rider.

Cartwright, Sir Richard John (b. Dec. 4, 1835, Kingston, Upper Canada—d. Sept. 24, 1912, Kingston, Ont., Can.), statesman and finance minister of Canada's Liberal Party; he supported free trade between the United States and Canada, in opposition to the trade protectionism of the Conservatives.

Sir Richard Cartwright, 1908
By courtesy of the Public Archives of Canada

Already a successful businessman, Cartwright was elected to the Parliament of the united province of Canada as an independent Conservative in 1863. After the Dominion of Canada was created in 1867, Cartwright disagreed with the financial policy of the Conservative Party leader, Sir John A. Macdonald, and went over to the Liberals.

From 1873 to 1878 he served as finance minister in Alexander Mackenzie's administration. As chief financial spokesman during the Liberal opposition (1878–96), he advocated unrestricted reciprocity with the United States. He was knighted in 1879. In 1896 he was minister of trade and commerce in Sir Wilfrid Laurier's administration, and in 1898–99 he represented Canada in the Anglo-American joint high commission at Quebec.

He retired to the Senate in 1904, keeping a portfolio in the Cabinet and serving as premier during Laurier's absence. In 1909–11 he was government leader in the Senate.

Caruaru, city, eastern Pernambuco *estado* ("state"), northeastern Brazil, on the Ipojuca River at 1,804 feet (550 m) above sea level. Caruaru originated as a weekly market centre; it was elevated to city status in 1857. Agriculture, livestock, and food processing are the principal sources of income, and there is some light manufacturing. The city has many fairs and religious festivals. It is accessible by train or automobile from Recife, the state capital,

Municipal Palace and gardens, Caruaru, Braz.
Plessner International

to the east, and is a major crossroads for the region. Pop. (2000 prelim.) 231,989.

Carúpano, city, northern Sucre *estado* ("state"), northeastern Venezuela. On the Caribbean Sea, near the centre of the twin peninsulas Araya and Paria, Carúpano is the commercial nucleus and principal port of an agricultural area, the principal export of which is cacao. Many fertile valleys in the highlands around Carúpano and throughout Sucre (representing a high percentage of the state's land area) are under cultivation. The city has grown slowly, as has all of Sucre; there is much out-migration to the national capital, Caracas, and to other states. Carúpano is accessible by highway and air as well as by sea. Pop. (1990) 92,333.

Carus, in full MARCUS AURELIUS CARUS (d. 283), Roman emperor 282–283.

Carus was probably from either Gaul or Illyricum and had served as prefect of the guard to the emperor Probus (276–282), whom he succeeded. Like his predecessors, Carus adopted the name Marcus Aurelius as a part of his imperial title. After a brief Danube campaign he led his troops against the Sāsānians, penetrating beyond the Tigris, where he died suddenly and mysteriously, allegedly struck by lightning. His sons Numerian and Carinus succeeded him.

Carus, Titus Lucretius: *see* Lucretius.

Caruso, Enrico, original name ERICO CARUSO (b. Feb. 27, 1873, Naples, Italy—d. Aug. 2, 1921, Naples), the most admired Ital-

Caruso as Radames in *Aida* by Giuseppe Verdi
Culver Pictures

ian operatic tenor of the early 20th century and one of the first musicians to document his voice on gramophone recordings.

Caruso was of a poor family and was the 18th of 20 children. Although he was a musical child who sang Neapolitan folk songs everywhere and joined his parish choir at the age of nine, he received no formal music training until his study with Guglielmo Vergine at age 18. Within three years, in 1894, he made his operatic debut, in Mario Morelli's *L'Amico Francesco* in Naples at the Teatro Nuovo. Four years later, after adding a number of impressive roles to his repertoire, he was asked to create the role of Loris in the premiere of Umberto Giordano's *Fedora* in Milan. He was a sensation and soon had engagements in Moscow, St. Petersburg (Russia), and Buenos Aires. He made his La Scala debut with *La Bohème* (1900). In 1901, after being unfavourably received in his performance in *L'elisir d'amore* in Naples, he vowed never again to sing in Naples, and he kept his word.

Caruso then created the chief tenor parts in *Adriana Lecouvreur*, *Germania*, and *La fanciulla del West*, and for the La Scala company the tenor roles in *Le Maschere* and *L'elisir d'amore*. World recognition came in the spring of 1902 after he sang in *La Bohème* at Monte Carlo and in *Rigoletto* at London's Covent Garden. He made his American debut in *Rigoletto* at the opening night of the Metropolitan Opera in New York City on Nov. 23, 1903, and continued to open each season there for the next 17 years, presenting 36 roles in all. His last public appearance—his 607th performance with the Metropolitan—was as Eléazar in *La Juive* (Dec. 24, 1920).

Caruso became the most celebrated and highest paid of his contemporaries worldwide. He made recordings of about 200 operatic excerpts and songs; many of them are still being published. His voice was sensuous, lyrical, and vigorous in dramatic outbursts and became progressively darker in timbre in his later years. Its appealing tenor qualities were unusually rich in lower registers and abounded in warmth, vitality, and smoothness.

Carvajal y Mendoza, Luisa de (b. Jan. 2, 1568, Jaraicejo, Extremadura, Spain—d. Jan. 2, 1614, London, Eng.), missionary who, moved by the execution of the Jesuit Henry Walpole in 1595, decided to devote herself to the cause of the faith in England.

With her share of the family fortune, Luisa founded a college for English Jesuits at Louvain, in the Spanish Netherlands (now Belgium), which was transferred in 1612 to Watten near Saint-Omer, where it remained until the suppression of the order. In 1605 she arrived in England and established herself under the protection of the Spanish ambassador, from whose house she carried on her activities. The same year she made herself conspicuous by her attentions to the Gunpowder Plot prisoners, accused of conspiracy to blow up King James I of England and Parliament. She was arrested in 1608, but the protection of the Spanish ambassador and the desire of the king to stand well with Spain secured her release. She died before attempts to banish her from England could prove successful.

Cārvāka, also called LOKĀYATA (Sanskrit: "Worldly Ones"), a quasi-philosophical Indian school of materialists who rejected the notion of an afterworld, the authority of the sacred scriptures, the Vedas, and the immortality of the self. Of the recognized means of knowledge (*pramāṇa*), the Cārvāka recognized only direct perception (*anubhava*). They advocated a policy of total opportunism and are often described in literature as addressing princes, whom they urged to act exclusively in their

own self-interest, thus providing the intellectual climate in which a text such as Kautilya's *Artha-sāstra* ("Handbook of Profit") could be written.

Although Cārvāka doctrine had disappeared by the end of the medieval period, its onetime importance is confirmed by the lengthy attempts to refute it found in both Buddhist and orthodox Hindu philosophical texts, which also constitute the main sources for knowledge of the doctrine.

Carvalho, Sebastião de (Portuguese leader); see Pombal, Sebastião de Carvalho, marquês de.

carvel construction, type of ship construction characteristic in Mediterranean waters during the Middle Ages, as contrasted with clinker construction in northern waters. In carvel construction the planks were fitted edge to edge against a previously built framework; hulls so constructed were smooth and well

Cutaway section of a boat uncovered at North Ferriby, Humberside, Eng., showing an early example of carvel construction

streamlined, but the work required more precision and skilled labour, and the hulls were more prone to weakness and leakage in heavy seas.

Carver, George Washington (b. 1861?, near Diamond Grove, Mo., U.S.—d. Jan. 5, 1943, Tuskegee, Ala.), American agricultural chemist, agronomist, and experimenter whose development of new products derived from peanuts (groundnuts), sweet potatoes, and soybeans helped revolutionize the agricultural economy of the South. For most of his career he taught and conducted research at the Tuskegee Institute in Tuskegee, Ala.

Carver was the son of a slave woman owned by Moses Carver. During the Civil War, slave

George Washington Carver

By courtesy of the Tuskegee Institute, Alabama photograph, P.H. Polk

owners found it difficult to hold slaves in the border state of Missouri, and Moses Carver therefore sent his slaves, including the young child and his mother, to Arkansas. After the war, Moses Carver learned that all his former slaves had disappeared except for a child named George. Frail and sick, the motherless child was returned to his former master's home and nursed back to health. The boy

had a delicate sense of colour and form and learned to draw; later in life he devoted considerable time to painting flowers, plants, and landscapes. Though the Carvers told him he was no longer a slave, he remained on their plantation until he was about 10 or 12 years old, when he left to acquire an education. He spent some time wandering about, working with his hands and developing his keen interest in plants and animals.

By both books and experience, George acquired a fragmentary education while doing whatever work came to hand in order to subsist. He supported himself by varied occupations that included general household worker, hotel cook, laundryman, farm labourer, and homesteader. In his late 20s he managed to obtain a high school education in Minneapolis, Kansas, while working as a farmhand. After a university in Kansas refused to admit him because he was black, Carver matriculated at Simpson College, Indianola, Iowa, where he studied piano and art, subsequently transferring to Iowa State Agricultural College (Ames, Iowa), where he received a bachelor's degree in agricultural science in 1894 and a master of science degree in 1896.

Carver left Iowa for Alabama in the fall of 1896 to direct the newly organized department of agriculture at the Tuskegee Institute, a school headed by the noted black American educator Booker T. Washington. At Tuskegee Washington was trying to improve the lot of black Americans through education and the acquisition of useful skills rather than through political agitation; he stressed conciliation, compromise, and economic development as the paths for black advancement in American society. Despite many offers elsewhere, Carver would remain at Tuskegee for the rest of his life.

After becoming the institute's director of agricultural research in 1896, Carver devoted his time to research projects aimed at helping Southern agriculture, demonstrating ways in which farmers could improve their economic situation. He conducted experiments in soil management and crop production and directed an experimental farm. At this time agriculture in the Deep South was in serious trouble because the unremitting single-crop cultivation of cotton had left the soil of many fields exhausted and worthless, and erosion had then taken its toll on areas that could no longer sustain any plant cover. As a remedy, Carver urged Southern farmers to plant peanuts and soybeans, which, since they belong to the legume family, could restore nitrogen to the soil while also providing the protein so badly needed in the diet of many Southerners. Carver found that Alabama's soils were particularly well-suited to growing peanuts and sweet potatoes, but when the state's farmers began cultivating these crops instead of cotton, they found little demand for them on the market. In response to this problem, Carver set about enlarging the commercial possibilities of the peanut and sweet potato through a long and ingenious program of laboratory research. He ultimately developed 300 derivative products from peanuts—among them cheese, milk, coffee, flour, ink, dyes, plastics, wood stains, soap, linoleum, medicinal oils, and cosmetics—and 118 from sweet potatoes, including flour, vinegar, molasses, rubber, ink, a synthetic rubber, and postage stamp glue.

In 1914, at a time when the boll weevil had almost ruined cotton growers, Carver revealed his experiments to the public, and increasing numbers of the South's farmers began to turn to peanuts, sweet potatoes, and their derivatives for income. Much exhausted land was renewed, and the South became a major new supplier of agricultural products. When Carver arrived at Tuskegee in 1896, the peanut had not even been recognized as a crop, but within the next half century it became one of the

six leading crops throughout the United States and, in the South, the second cash crop (after cotton) by 1940. In 1942 the U.S. government allotted 5,000,000 acres of peanuts to farmers. Carver's efforts had finally helped liberate the South from its excessive dependence on cotton.

Among Carver's many honours were his election to Britain's Society for the Encouragement of Arts, Manufactures, and Commerce (London) in 1916 and his receipt of the Spingarn Medal in 1923. Late in his career he declined an invitation to work for Thomas A. Edison at a salary of more than \$100,000 a year. Presidents Calvin Coolidge and Franklin D. Roosevelt visited him, and his friends included Henry Ford and Mohandas K. Gandhi. Foreign governments requested his counsel on agricultural matters: Joseph Stalin, for example, in 1931 invited him to superintend cotton plantations in southern Russia and to make a tour of the Soviet Union, but Carver refused.

In 1940 Carver donated his life savings to the establishment of the Carver Research Foundation at Tuskegee for continuing research in agriculture. During World War II he worked to replace the textile dyes formerly imported from Europe, and in all he produced dyes of 500 different shades.

Many scientists thought of Carver more as a concoctionist than as a contributor to scientific knowledge. Many of his fellow blacks were critical of what they regarded as his subservience. Certainly, this small, mild, soft-spoken, innately modest man, eccentric in dress and mannerism, seemed unbelievably heedless of the conventional pleasures and rewards of this life. But these qualities endeared Carver to many whites, who were almost invariably charmed by his humble demeanour and his quiet work in self-imposed segregation at Tuskegee. As a result of his accommodation to the mores of the South, whites came to regard him with a sort of patronizing adulation.

Carver thus increasingly came to stand for much of white America as a kind of saintly and comfortable symbol of the intellectual achievements of black Americans. Carver was evidently uninterested in the role his image played in the racial politics of the time. His great desire in later life was simply to serve humanity; and his work, which began for the sake of the poorest of the black sharecroppers, paved the way for a better life for the entire South. His efforts brought about a significant advance in agricultural training in an era when agriculture was the largest single occupation of Americans, and he extended Tuskegee's influence throughout the South by encouraging improved farm methods, crop diversification, and soil conservation.

Carver, John (b. c. 1576, Nottinghamshire or Derbyshire, Eng.—d. Apr. 15, 1621, Plymouth, Mass.), first governor of the Pilgrim settlement at Plymouth in New England.

Originally a prosperous businessman when the Separatists decided to emigrate to North America, Carver obtained financial backing for the trip and chartered the *Mayflower*. He was elected governor on Nov. 21, 1620, after the signing of the Mayflower Compact. His major accomplishment was the establishment of a treaty of alliance between the Indian chief Massasoit and James I of England.

Carver, Jonathan (b. April 13, 1710, Weymouth, Mass. [U.S.]—d. Jan. 31, 1780, London, Eng.), early explorer of North America and author of one of the most widely read travel and adventure books in that period.

Carver was promoted to lieutenant (1759) and then to captain (1760) while serving in a Massachusetts regiment during the French and Indian War. In 1766 he was sent by Major Robert Rogers on a journey of exploration westward from Rogers' base at Fort Michilimackinac (now Mackinac, Mich.). Carver traveled west through the Great Lakes region to the Mississippi River and then up that river

Jonathan Carver, engraving
By courtesy of the Library of Congress, Washington, D.C.

to the country of the Sioux Indians. Alone, he spent the winter of 1766–67 at a Sioux village on the Minnesota River. Returning to Fort Michilimackinac in the spring, he met Captain James Tute in command of a party that had been sent out by Rogers to explore a route to the Pacific Ocean. Tute brought orders for Carver to join the party as draftsman and third in command. They proceeded up the Mississippi and skirted the shores of Lake Superior to the Grand Portage. Failing to receive supplies, the party abandoned the expedition and returned to Fort Michilimackinac (August 1768).

Rogers had hired Carver without authorization, and as a result Carver was never paid for his services. Carver left for England in 1769 to have his journal published, but the project met with many delays. His journal was finally published in 1778 in London as *Travels Through the Interior Parts of North America in the Years 1766, 1767, 1768*; it was an immediate success and eventually went through more than 30 editions. The book gives a vivid picture of the rich lands and Indian inhabitants of the upper Mississippi River valley. Carver, however, did not live to enjoy any financial reward from it. He died a broken old man and was buried in a potter's field.

Carver, Raymond (Clevie) (b. May 25, 1938, Clatskanie, Ore., U.S.—d. Aug. 2, 1988, Port Angeles, Wash.), American short-story writer and poet whose realistic writings about the working poor mirrored his own life.

The son of a sawmill worker, Carver married a year after finishing high school and supported his wife and two children by working as a janitor, gas-station attendant, and delivery boy. He became seriously interested in a writing career after taking a creative-writing course at Chico State College in 1958. His short stories began to appear in magazines while he studied at Humboldt State College in Arcata, Calif. (B.A., 1963). Carver's first success as a writer came in 1967 with the story "Will You Please Be Quiet, Please?," and he began writing full-time after losing his job as a textbook editor in 1970. The highly successful short-story collection *Will You Please Be Quiet, Please?* (1976) established his reputation.

Despite his success, Carver began drinking heavily in 1967 and was repeatedly hospitalized for alcoholism in the 1970s, while continuing to turn out short stories. After

conquering his drinking problem in the late 1970s, he taught for several years at the University of California, Santa Cruz, and in 1983 he won a literary award whose generous annual stipend freed him to concentrate on his writing full-time. His later collections were *What We Talk About When We Talk About Love* (1981), *Cathedral* (1984), and *Where I'm Calling From* (1988). He died of lung cancer at age 50.

In his short stories Carver chronicled the everyday lives and problems of the working poor in the Pacific Northwest. His blue-collar characters are crushed by broken marriages, financial problems, and failed careers, but they are unable to understand or even articulate their own anguish. Carver's stripped-down, minimalist prose style is remarkable for its honesty and power. He is credited with helping revitalize the genre of the English-language short story in the late 20th century.

Carver, Robert (b. c. 1490, Scotland?—d. 1547?), outstanding Scottish composer whose extant works include five masses and two motets. One of the motets, for 19 voices, was found in a large choir book compiled in the first half of the 16th century at Scone Abbey, Perthshire, and now preserved in the National Library of Scotland. References in the volume suggest that Carver took holy orders at the age of 16 and remained at that Augustinian abbey until 1546 or later. Nothing is heard of him after that time.

Carver chair, American spool chair with a rush seat and turned (shaped on a lathe) legs that rise above the seat level to frame the back and to support the armrests. The back normally contained three vertical spindles and was topped with decorative finials.

Carver armchair, ash, American, 1660–90; in the Art Institute of Chicago
By courtesy of The Art Institute of Chicago

Carver chairs were named after John Carver (c. 1576–1621), founder and first governor of the Plymouth colony in America. The term Carver is also applied to an armchair in a set of dining chairs; it is normally placed at the head of the table.

Cary, Alice; and Cary, Phoebe (respectively b. April 26, 1820, near Cincinnati, Ohio, U.S.—d. Feb. 12, 1871, New York, N.Y.; b. Sept. 4, 1824, near Cincinnati, Ohio, U.S.—d. July 31, 1871, Newport, R.I.). American poets whose work was both moralistic and idealistic.

Self-educated, the Cary sisters always wrote in unbroken companionship. Their poems were first collected in a volume entitled *Poems of Alice and Phoebe Cary* (1849). Alice, much the more voluminous writer of the two, also wrote prose sketches, novels, and poems, the best of which treat the surroundings and friends of her girlhood. Her lyrical poem "Pic-

tures of Memory" was praised by Edgar Allan Poe. Phoebe published two volumes of poems (1854, 1868) but is best known as the author of the hymn "Nearer Home," beginning "One sweetly solemn thought."

Cary, Henry Francis (b. Dec. 6, 1772, Gibraltar—d. Aug. 14, 1844, London, Eng.), English biographer and translator, best known for his blank verse translation of *The Divine Comedy* of Dante.

Educated at the University of Oxford, Cary took Anglican orders in 1796 and was later assistant librarian in the British Museum. He published biographies of English and French poets and translated the ancient Greek writers Aristophanes and Pindar. Although Cary's translation of Dante hardly reproduces the original's great strength, it manages to retain some of its vividness. *The Inferno* appeared in 1805–06; the whole work, under the title *The Vision, or Hell, Purgatory, and Paradise, of Dante*, in 1814. It was long the standard English translation of Dante's masterpiece.

Cary, Joyce, in full ARTHUR JOYCE LUNEL CARY (b. Dec. 7, 1888, Londonderry, Ire.—d. March 29, 1957, Oxford, Eng.), English novelist who developed a trilogy form in which each volume is narrated by one of three protagonists.

Cary was born into an old Anglo-Irish family, and at age 16 he studied painting in Edinburgh and then in Paris. From 1909 to 1912 he was at Trinity College, Oxford, where he read law. Having joined the colonial service in 1914, he served in the Nigeria Regiment during World War I. He was wounded while fighting in the Cameroons and returned to civil duty in Nigeria in 1917 as a district officer. West Africa became the locale of his early novels.

Resolved to become a writer, Cary settled in Oxford in 1920. Although that year he published 10 short stories in the *Saturday Evening Post*, an American magazine, he decided he knew too little about philosophy, ethics, and history to continue writing in good conscience. Study occupied the next several years, and it was only in 1932 that his first novel, *Aissa Saved*, appeared. The story of an African girl converted to Christianity but still retaining pagan elements in her faith, it was followed by three more African novels—*An American Visitor* (1933), *The African Witch* (1936), and *Mister Johnson* (1939)—and a novel about the decline of the British Empire, *Castle Corner* (1938). Childhood was the theme of his next two novels: his own in *A House of Children* (1941) and that of a cockney wartime evacuee in the country in *Charley Is My Darling* (1940).

Cary's trilogy on art begins with the first-person narration of a woman, Sara Monday, in *Herself Surprised* (1941) and follows with that of two men in her life, the lawyer Tom Wilcher in *To Be a Pilgrim* (1942) and the artist Gulley Jimson in *The Horse's Mouth* (1944), his best-known novel. Monday is portrayed as a warm-hearted, generous woman who is victimized both by the conservative upper-class Wilcher and by the talented but disreputable painter Jimson. The latter character is a social rebel and visionary artist whose humorous philosophy and picaresque adventures in *The Horse's Mouth* helped make him one of the best-known characters in 20th-century fiction.

Similarly, Cary's other trilogy is seen from the vantage of a politician's wife in *A Prisoner of Grace* (1952), the politician himself in *Except the Lord* (1953), and the wife's second husband in *Not Honour More* (1955). He planned a third trilogy on religion but was afflicted with muscular atrophy and knew he could not live to complete it. Hence he treated the theme in a single novel, *The Captive and the Free* (1959). His short stories were collected in *Spring Song* (1960).

Cary, Lucius: see Falkland, Lucius Cary, 2nd Viscount of.

caryatid, in classical architecture, draped female figure used instead of a column as a support. In marble architecture they first appeared in pairs in three small buildings (treasuries) at Delphi (550–530 bc), and their origin can be traced back to mirror handles of nude figures carved from ivory in Phoenicia and draped figures cast from bronze in archaic Greece. According to a story related by the 1st-century-BC Roman architectural writer Vitruvius, caryatids represented the women of Caryae, who were doomed to hard labour because the town sided with the Persians in 480 bc during their second invasion of Greece.

The most celebrated example is the caryatid porch of the Erechtheum with six figures (420–415 bc), on the Acropolis of Athens. They were later directly copied, in alternation with columns, in the Roman emperor Hadrian's Villa at Tivoli. Other examples include the figure at the Villa Albani at Rome and two colossal figures in the smaller propylon at Eleusis. They also appeared in the upper stories of Marcus Vipsanius Agrippa's Pantheon and in the colonnade surrounding the Forum of Augustus at Rome, as well as in the Incantada Salonika (Thessaloniki, Greece).

Caryatids are sometimes called *korai* ("maidens"). Similar figures, bearing baskets on their heads, are called canephores (from *kanēphoroi*, "basket carriers"); they represent the maidens

families and some 10,000 species, distributed throughout the world. Although most of the species are annual or perennial herbs, various families have shrubs, vines, and trees. Herbaceous members include ornamental flowers, weeds, and vegetables.

A brief treatment of Caryophyllales follows. For full treatment, see MACROPAEDIA: Angiosperms.

The majority of the food-producing plants of Caryophyllales belong to the goosefoot family (Chenopodiaceae), including spinach (*Spinacea oleracea*), the sugar beet (*Beta vulgaris*), and Swiss chard (*Beta vulgaris* variety *ciela*). Lamb's-quarters (*Chenopodium album*), a cosmopolitan weed, is useful as a potherb when young. Another edible member of the order is poke (*Phytolacca americana*).

Many weedy genera make up the pigweed family (Amaranthaceae). *Amaranthus retroflexus*, the re-rooted, noxious pigweed, has spread northward from the tropics of the Americas and Africa into most agricultural areas of the world. Many persons are allergic to its pollen.

Ornamental plants belong to several families in Caryophyllales. The family Nyctaginaceae is known for the four-o'clock (*Mirabilis jalapa*), which flowers late in the day, and *Bougainvillea*. Portulacaceae includes the rose moss (*Portulaca grandiflora*), widely grown as a garden annual, and spring-beauty (*Claytonia virginica*), a wildflower of eastern North

the thousands of species constituting these two families. In some, male and female parts appear in different flowers, generally on the same plant.

Most members of the Caryophyllales develop a perianth consisting of sepals only. Another attribute of this order is a one-chambered, superior ovary. The developmental patterns of stems and leaves, resemblances of tissues and cells at the microscopic level, and synthesis of unique cell products are used to ascertain relationships.

In most flowering plants, colours ranging from nearly red to nearly blue are dependent on the presence of chemical compounds called anthocyanins; colours ranging from yellow to reddish orange are dependent on compounds called anthoxanthins. A distinct but parallel group of pigments, known as betalains (betacyanins and betaxanthins) occurs only in a large number of Caryophyllales. Because the betalains are apparently restricted to this order, their presence has assumed some taxonomic significance.

Caryophyllidae, subclass of dicotyledonous flowering plants, the vast majority of whose members are in the family Caryophyllales (*q.v.*).

caryopsis, also called GRAIN, specialized type of dry, one-seeded fruit (achene) characteristic of grasses, in which the ovary wall is united with the seed coat, making it difficult to separate the two except by special milling processes. All the cereal grains except buckwheat have caryopses.

Cas-gwent (Wales): see Chepstow.

Casa, Giovanni Della (b. June 28, 1503, La Casa, Mugello, Tuscany [Italy]—d. Nov. 14, 1556, Montepulciano, Siena), Italian bishop, poet, and translator who is remembered chiefly for his popular and widely translated treatise on manners, *Galateo*.

After growing up in Mugello, Della Casa studied in Bologna, Florence, Padua, and Rome. In 1544 he was named archbishop of Benevento but was sent as papal nuncio to Venice, and in 1555 Pope Paul IV made him secretary of state. Besides some youthful satiric verse in the manner of Francesco Berni, Della Casa produced lyric poems in a majestic style and some political works, such as *Orazioni politiche* (1707; "Political Discourses"), in which he expressed his sorrow for the calamities of Italy.

The work that brought Della Casa immediate renown, however, was his sane and witty treatise *Galateo*. Written between 1550 and 1555, first published with his *Rime* in 1558, and first translated into English by Robert Peterson in 1576, *Galateo* differs from an earlier etiquette manual, Baldassare Castiglione's *Il cortegiano* ("The Courtier"), in being more concerned with the details of correct behaviour in polite society than with courtly etiquette. Like *Il cortegiano*, Della Casa's manual became widely read throughout Europe.

Casa da Guiné, also called CASA DE GUINÉ E MINA, byname CASA DA INDIA: see India, House of.

Casa de Contratación, byname CASA DE LAS INDIAS (Spanish trading house): see Contratación, Casa de.

Casa Grande National Monument, pre-Columbian ruins in south-central Arizona, U.S., in the Gila Valley, immediately north of Coolidge. Authorized as Casa Grande Ruins Reservation in 1889 and proclaimed as such in 1892, the site was designated a national monument in 1918. The ruins, discovered in 1694 by Eusebio Kino, a Jesuit missionary, are dominated by the extraordinary Casa

The caryatid porch of the Erechtheum, the Acropolis, Athens, designed by Mnesicles, 5th century bc

A F Kersting

who carried sacred objects used at feasts of the gods. The male counterparts of caryatids are referred to as atlantes (*see* atlas).

Caryophyllaceae, the pink family of flowering plants (order Caryophyllales), comprising some 89 genera and 2,070 species of herbaceous plants, mainly of north temperate distribution. The members are diverse in appearance and habitat; most of them have swollen leaf and stem joints.

Among the important genera are *Stellaria*; *Cerastium*; *Arenaria* (including sandwort); *Silene* and *Lychnis*; *Gypsophila*; and *Saponaria* (including soapwort). The most valued horticulturally is *Dianthus*, which includes the carnation, commonly cultivated by florists and also grown in Europe for use in perfumes; sweet William, an old-fashioned garden flower; and the cottage, or grass, pink. *See also* baby's breath; campion; carnation; chickweed; pink; sweet William.

Caryophyllales, also called CENTROSPERMAE, the pink order of flowering plants, belonging to the class called dicotyledon (characterized by two seed leaves). It consists of 12

America. The pink family (Caryophyllaceae) has many genera of ornamentals. Members of the cactus family (Cactaceae) are cultivated throughout the world for their unusual forms and sometimes striking blossoms, and various species are grown for food. (Some authorities place this family in a separate order, Cactales.)

Although a few families in this order reproduce by means of rhizomes (*i.e.*, vegetatively), the major means of reproduction is sexual. The production and dispersal of seeds is very efficient. Inflorescences (flower clusters) of various structural types consist of small, short-stalked, compactly arranged flowers.

In the Amaranthaceae and Chenopodiaceae, sepals are five in number, petals are lacking, and stamens (male) may number up to five. The pistil (female) consists of two carpels as shown by the two terminal, pollen-receptive stigmas and two styles. The swollen, basal ovary is one-chambered and contains a single ovule. After pollination and fertilization, the ovule becomes the seed and the ovary the fruit, which is very small; it ripens dry to become a closed nutlet or an achene. Variations in number of flower parts occur among

Grande ("Big House"), a four-story building constructed of unreinforced clay and topped by an adobe watchtower. Built by Salado Indians in the early 14th century, it is the only pre-Columbian building of its type in existence. Nearby are partially excavated village sites established many centuries earlier by Hohokam Indians who practiced farming, as attested by remains of an irrigation system. The monument occupies 473 acres (191 hectares) and has a museum in its administration building that displays local artifacts.

Casablanca, Arabic *AD-DĀR AL-BAYḌĀ'*, or *DAR EL-BĒIDA*, principal port of Morocco, on the North African Atlantic seaboard.

The origin of the town is not known. A Berber village called Anfa stood on the present-day site in the 12th century; it became a pirates' base for harrying Christian ships and was destroyed by the Portuguese in 1468. The Portuguese returned to the area in 1515 and built a new town called Casa Branca ("White House"). It was abandoned in 1755 after a devastating earthquake, but the 'Alawī sultan Sidi Muhammad ibn 'Abd Allāh rebuilt the town in the late 18th century. Spanish merchants, who named it Casablanca, and other European traders began to settle there. The French after a time outnumbered other European settlers, and the name *Maison Blanche* ("White House") became as common as Casablanca.

The town was occupied by the French in 1907, and during the French protectorate (1912-56) Casablanca became the chief port of Morocco. Since then, the growth and development of the city have been continuous and rapid. During World War II the city was the seat of a British-U.S. summit conference in 1943. In 1961 a conference at Casablanca, presided over by King Muhammad V of Morocco, founded the Casablanca group of African states.

The man-made port of Casablanca is protected from the sea by a breakwater and handles most of Morocco's foreign trade. It is also a port of call for European ships; Boulevard Hansali, which leads to the port, is lined with shops for tourists. Inland from the docks and the harbour is the old medina, the original Arab town. Still enclosed in parts by its original rampart walls, it is a maze of narrow streets and whitewashed brick or stone houses. In a semicircle outside the walls of the medina is the town built by the French. Avenues radiating from Muhammad V Square are intersected by ring roads that reach to the coast on either side of the harbour. Muhammad V Square, near the gateway of the old medina, and United Nations Square are the business and administrative centres of the town, where banks, hotels, and large modern shops are located. Farther south, overlooking the gardens of the Park of the Arab League, is the white Cathedral of the Sacré Coeur. West of the park and stretching toward the coast are the gardens and villas of residential districts, such as Anfa. Large numbers of poor Muslims live in shantytowns (*bidonvilles*) on the outskirts of the city.

Buses are the principal means of public transport. Roads connect Casablanca with other major cities. There is also a railway line that runs northeastward into Algeria and Tunisia. The Casablanca-Anfa airport, to the southwest, and the Casablanca-Nouaceur airport, to the east of the city, provide international services.

The rapid commercial progress of Casablanca, especially the growth of its port, has established it as the economic capital of Morocco. It accounts for more than half of the bank transactions and industrial production of Morocco. Casablanca's industries include textiles, electronics, leather works, food canning,

and the production of beer, spirits, and soft drinks. Fishing is important in coastal waters, where a fairly wide continental shelf provides a good fishing ground. The catch includes soles, red mullet, turbot, sea eels, crabs, and shrimps.

Casablanca has Arab and French schools at different educational levels. There are also various cultural and utilitarian institutes, such as the Goethe-Institut, the Municipal College of Fine Arts, the Municipal Library, a prehistory society, an institute of fishing, and a horticultural society.

As Morocco's principal centre for recreation, Casablanca has a number of pleasant beaches, parks, and attractive promenades along the seafront. Pop. (1982) 923,620.

Casablanca Conference (Jan. 12-23, 1943), meeting during World War II at Casablanca between President Franklin D. Roosevelt and Prime Minister Winston Churchill and their respective military chiefs and aides, who planned future global military strategy for the Western Allies. Though invited, Joseph Stalin declined to attend.

The work of the conference was primarily military—deciding on the invasion of Sicily (after completion of the North African campaign), apportioning forces for the Pacific theatre and outlining major lines of attack in the Far East, and agreeing on the concentrated bombing of Germany. However, Roosevelt and Churchill also found time to discuss nuclear bomb research, to consider the competing claims for the leadership of the French effort against the Axis, and, most important of all, to demand an "unconditional surrender" from Germany, Italy, and Japan.

Both the announcement and the policy of unconditional surrender came in for severe criticism after the war, when it was contended that opposition groups in Germany might have overthrown Adolf Hitler and negotiated an earlier peace if they had not been discouraged by fear of Allied vindictiveness. Churchill's reply was that any statement of terms acceptable at that time to Allied leaders and to their peoples, such as the partition of Germany, its complete demilitarization, and reparations in kind and in forced labour, would have been more discouraging still.

Casadesus, Robert (b. April 7, 1899, Paris—d. Sept. 19, 1972, Paris), French pianist and composer best known for his playing of the French repertoire.

He was a member of a distinguished family of French musicians. Casadesus studied with Louis Diémer at the Paris Conservatory where he won several prizes, including the Grand Prix Diémer. Beginning in 1922, he toured extensively in Europe, South America, the United States, and Canada, making his U.S. debut under Arturo Toscanini in 1935. He taught at the American Conservatory at Fontainebleau and in the United States during World War II.

He recorded the complete piano music of Maurice Ravel. In addition to the works of French composers, Casadesus frequently performed music by Wolfgang Amadeus Mozart, Ludwig van Beethoven, and Robert Schumann. His playing was marked by extreme clarity and a Gallic sense of balance. A prolific composer, he wrote works considered adventurous but balanced.

Casal, Julián del (b. Nov. 7, 1863, Havana—d. Oct. 21, 1893, Havana), poet who was one of the most important forerunners of the Modernist movement in Latin America.

After a short period of formal education, Casal was forced to leave school because of failing family fortunes. His first volume of poetry, *Hojas al viento* (1890; "Leaves in the Wind"); clearly shows the influence of the French Parnassian poets, especially Baudelaire. Throughout his poetry, Casal expressed an al-

most compulsive preference for the artificial and man-made over the natural. A chronic invalid, he died of tuberculosis while preparing his third book, *Bustos y rimas* (1893; "Busts and Rhymes"), which was published shortly after his death.

Casale Monferrato, town, Alessandria province, Piemonte (Piedmont) region, northwestern Italy, on the Po River in the Monferrato Hills east of Turin. It was founded in the 8th century on the site of ancient Bodincomagus. In the 10th century the town belonged to the marquessate of Monferrato, becoming its capital in 1435. It passed to the Gonzaga family in 1536 and was long the subject of dispute between France and Spain. Its citadel (1590) changed hands frequently before being dismantled in 1695 and passing to Savoy in 1707. The seat of a bishopric, Casale Monferrato's notable landmarks include the cathedral of S. Evasio (1107); the 15th-century church of S. Domenico, with a Renaissance portal; the 17th-century castle; and many 18th-century palaces. Lime, cement, and artificial stone are produced, as are farm machinery, electrical appliances, and tartaric acid. Wine is exported. Pop. (1984 est.) mun., 41,161.

Casals, Pablo, Catalan PAU CASALS (b. Dec. 29, 1876, Vendrell, Spain—d. Oct. 22, 1973, Río Piedras, Puerto Rico), Spanish-born cellist and conductor, known for his virtuosic technique, skilled interpretation, and consummate musicianship.

Casals, 1957

UPI—EB Inc

Casals made his debut in Barcelona in 1891 after early training in composition, cello, and piano. After further study in Madrid and Brussels he returned to Barcelona in 1896 as principal cellist at the Gran Teatro del Liceo. By this time he had established his innovative technique; by making his left-hand positions more flexible and using a freer bowing technique, he created an individual style marked by seeming effortlessness and a singing tone. Casals toured internationally between 1898 and 1917 and formed a celebrated trio with Alfred Cortot (piano) and Jacques Thibaud (violin). Having won an international reputation as a cellist, Casals helped found in 1919 the École Normale de Musique in Paris and also established and conducted the Orquestra Pau Casals in Barcelona.

An outspoken opponent of Fascism, he was forced to move in 1936 to Prades in Catalan

France. He refused to return to Spain after the Spanish Civil War (1936–39) and announced his retirement from public performance in 1946 to protest worldwide recognition of the Franco regime in Spain; in 1950, however, he returned to recording and conducting, choosing spoken over silent protest. In 1956 he moved to Puerto Rico, from which place he continued his personal musical crusade for peace until his death.

Casals was a romantic who eschewed the drier, literal interpretations of modernism. His love for the works of J.S. Bach formed the core of his sensibilities. He revitalized appreciation of Bach's cello music, especially with his masterful rendition of the six unaccompanied suites for cello.

Casamance, region of Senegal that lies south of The Gambia along the Casamance River. The region has ample rainfall, abundant in the south, and the lower course of the Casamance River is covered by dense vegetation; mangroves, oil palms, and raffia palms predominate. Rice, cotton, and corn (maize) are cultivated.

Once the territory of the king, or *mansa*, of Kasa, who was a leading trader with the Portuguese, the region was subsequently inhabited by migrants from the Mali empire, the Diola (Jola), the Malinke, and other groups. Casamance was the last part of what is now Senegal to be conquered (beginning in 1903) by Europeans, and small pockets of resistance were active until after World War I. Isolated from the larger northern portion of the country, Casamance retained a distinctive identity; many of its inhabitants, for example, retained animist beliefs while the northern Senegalese adopted Islām. An outlawed separatist group, the Movement of the Democratic Forces of Casamance, continued to operate in the region during the early 1990s.

Casamance River, river in western Africa, rising in southern Senegal and flowing west through the Casamance region, which lies between The Gambia (north) and Guinea-Bissau (south). The river receives various small tributaries and empties into the Atlantic Ocean after a course of 190 miles (300 km). Except for the tidal, salty 75-mile (120-kilometre) portion that is affected by the ocean, the river flows through broad, flat floodplains with luxuriant vegetation. There is a permanent flow as far upstream as Fafakourou (25 miles [40 km] northeast of Kolda). The Casamance makes a poor waterway, however, and even small boats can only proceed as far as Sédhiou (about 80 miles [130 km] inland).

Casanare, *departamento*, north-central Colombia. It is located in the eastern Llanos (Plains) and is bounded on the west by the Cordillera Oriental, on the north by the Casanare River, and on the south and east by the Meta River. Casanare was an autonomous province during the Colombian wars of independence and was a self-governing national territory in the late 19th century. Until 1974, when it became an *intendencia* ("intendency"), Casanare was formally a part of the department of Boyacá. The *intendencia* became a *departamento* in 1991. Casanare consists of mostly grassland within the Llanos. It is low-lying, tropical in climate (with alternate wet and dry seasons), and has an average elevation of only 330–1,300 feet (100–400 m). The principal economic activities are cattle raising and subsistence agriculture. Roads were practically nonexistent in the region before the discovery (1978) and foreign extraction (1983) of local petroleum pools. El Yopal is the capital. Area 17,236 square miles (44,640 square km). Pop. (1997 est.) 226,896.

Casanova, Giovanni Giacomo, byname JEAN-JACQUES, CHEVALIER DE SEINGALT (b. April 2, 1725, Venice [Italy]—d. June 4, 1798, Dux, Bohemia [now Duchcov, Czech Re-

public]), ecclesiastic, writer, soldier, spy, and diplomatist, chiefly remembered as the prince of Italian adventurers and as the man who made the name Casanova synonymous with "libertine." His autobiography, which perhaps exaggerates some of his escapades, is a splendid description of 18th-century society in the capitals of Europe.

The son of an actor, Casanova was expelled as a young man from the seminary of St. Cyprian for scandalous conduct and launched on a colourful, dissolute career. After a time in the service of a Roman Catholic cardinal, he was a violinist in Venice, joined the Masonic Order (1750) in Lyon, then traveled to Paris, Dresden, Prague, and Vienna. Back in Venice in 1755, Casanova was denounced as a magician and sentenced to five years in the Piombi, prisons under the roof of the Doges' Palace. On Oct. 31, 1756, he achieved a spectacular escape and made his way to Paris, where he introduced the lottery in 1757 and made a financial reputation and a name for himself among the aristocracy. Wherever he went, Casanova relied on personal charm to win influence and on gambling and intrigue to support himself.

Fleeing from his creditors in Paris in 1760, he assumed the name Chevalier de Seingalt (which he retained for the rest of his life) and traveled to southern Germany, Switzerland (where he met Voltaire), Savoy, southern

France, Florence (whence he was expelled), and Rome. He also spent some time in London. In Berlin (1764) Frederick II offered him a post. Casanova moved on to Riga, St. Petersburg, and Warsaw. A scandal followed by a duel forced him to flee, and he eventually sought refuge in Spain. Permitted to return to Venetian territory between 1774 and 1782, he acted as a spy for the Venetian inquisitors of state. He spent his final years (1785–98) in Bohemia as librarian for the Count von Waldstein in the château of Dux.

As versatile in his writing as he was in his career, Casanova wrote occasional verse, criticism, a translation of the *Iliad* (1775), and a satirical pamphlet on the Venetian patriciate, especially the powerful Grimani family. His most important work, however, is his vivid autobiography, first published after his death as *Mémoires de J. Casanova de Seingalt*, 12 vol. (1826–38). (A definitive edition, based on the original manuscripts, was published in 1960–62 with the title *Histoire de ma vie [History of My Life]*.) This work provides an account of Casanova's dissolute life and established his reputation as an archetypal seducer of women.

Casas, Bartolomé de Las (Spanish historian): see Las Casas, Bartolomé de.

Casas Grandes, town on the Casas Grandes River, in the northwestern corner of Chihuahua *estado* ("state"), northern Mexico. When it was settled by the Spaniards in 1661

or 1662, the area belonged to the Suma Indians. The town's name, Spanish for "great houses," refers to the extensive, multistoried ruins of a pre-Columbian town nearby, which was probably founded in 1050 and burned around 1340, after which the abandoned val-

Ruins of pre-Columbian town, Casas Grandes, Mex. Walter Aguilar

ley lands were occupied by the Suma, who migrated in from the east. Ruins of this type are common in the valleys of the Casas Grandes and its tributaries. The area is now a national monument under the jurisdiction of the National Institute of Anthropology and History. Cotton, cereals, and livestock are raised in the area. Pop. (2000 prelim.) 10,027.

Casaubon, Isaac (b. Feb. 18, 1559, Geneva [Switzerland]—d. July 1, 1614, London, Eng.), French classical scholar and theologian who was one of the leading scholars of the era.

Casaubon was born to French Huguenot refugees. Three years after his birth, the family returned to France and settled at Crest in Dauphiné. Casaubon was educated by his father until at age 19 he was sent to the Academy of Geneva, where in 1581 he became professor of Greek. He remained at the academy until 1596, making the acquaintances that eventually led to his long correspondence (beginning in 1594) with another leading classical scholar, Joseph Justus Scaliger.

From 1596 to 1599 Casaubon taught at the University of Montpellier. It was during this tenure, while he was engaged upon what is considered to be his masterwork—his edition of and commentary on the works of the ancient Greek grammarian Athenaeus—that he developed his unique style of illustrative commentary, at once apposite and profuse.

In 1600 Casaubon was called to Paris, where he became involved in a religious controversy between Roman Catholic and Protestant theologians that was to haunt him for the remainder of his life. Casaubon remained in Paris until 1610. He was assigned a pension by King Henry IV and succeeded to the salaried post of sublibrarian of the royal library.

In 1610, after the king's assassination, Casaubon was invited to England, where he was naturalized in 1611. Though he retained his appointments in France, he never returned there.

In addition to translations with commentaries on the works of Theophrastus, Suetonius, Polybius, and others, Casaubon wrote a two-volume diary, the *Ephemerides* (published 1850).

cascade, waterfall, especially a series of small falls, consisting of water descending over rocks or boulders. It may be natural or it may be artificial. The cascade has often been used as a feature of formal gardens.

A garden cascade properly employs a natural supply of water and a sloping site; but the site is usually adapted artificially to take advantage of the stream, and sometimes a cascade that strives to appear natural is dependent on a head of water artificially created by pumps.

Natural cascades can be the chief reason for

a garden's existence in a particular place, as at Tivoli in central Italy, where the fall of the

Cascade in the form of a water stairway, Palazzo Farnese, Caprarola, Italy
Edwin Smith

Aniene River was made into the garden of the Villa d'Este. Cascades can be used in architectural gardens in the form of water stairways, as at the Palazzo Farnese at Caprarola, Italy.

Cascade Range, segment of the Pacific mountain system (*q.v.*) of western North America. The Cascades extend northward for more than 700 miles (1,100 km) from Lassen Peak, in northern California, U.S., through Oregon and Washington to the Fraser River in southern British Columbia, Can. Many peaks exceed 10,000 feet (3,000 m), including Mount Hood (11,235 feet [3,424 m], highest point in Oregon) and Mount Rainier (14,410 feet [4,392 m], highest in Washington and in the Cascade Range). Most of the summits are extinct volcanoes, but Lassen Peak (10,457 feet [3,187 m]) and several others have erupted in the recent past. Mount Baker (10,778 feet [3,285 m]) steamed heavily in 1975, and Mount St. Helens (8,365 feet [2,550 m]) erupted in 1980 and again in 1981. The mountains lie 100 to 150 miles (160 to 240 km) inland from the Pacific Ocean and east of the broad depressions known as the Puget Sound Lowland and the Willamette Valley, which separate the moist coastal region from the arid interior. They are continued by the Coast Mountains of British Columbia to the north and the Sierra Nevada to the south.

Marked by glaciation (which has formed many lakes) and stream dissection, the mountains are a headstream region for the Willamette River. Except for the peaks lying above the timberline, the entire range is heavily wooded and is within conservation areas and national forests. The western slope, fed by up to 100 inches (2,500 mm) of precipitation yearly, has dense stands of Douglas fir trees. North Cascades, Mount Rainier, Crater Lake, and Lassen Volcanic national parks, as well as Lava Beds National Monument and Manning Provincial Park (Canada), offer unusual natural formations and magnificent scenery. Tourism, outdoor recreation, and water for hydroelectric power, irrigation, and industry are the main activities and assets of the range.

The English navigators George Vancouver and William R. Broughton saw the Cascades in 1792. The American explorers Meriwether Lewis and William Clark, on their expedition to the northwest in 1806, passed through the range in the 4,000-foot- (1,219-metre-) deep

Columbia River Gorge on the Washington-Oregon border. The range was named for the great cascades found near the gorge.

Cascade Tunnel, one of the longest railroad tunnels in the United States, located in central Washington about 60 miles (100 km) east of Seattle. It carries a line of the Burlington Northern railroad through the Cascade Range between Berne (on the east) and Scenic. It is 41,078 feet (7.8 miles [12.5 km]) long. Constructed from 1925 to 1929, it replaced a shorter tunnel a few miles to the north.

Cascais, also spelled **CASCAES**, town, Lisboa *distrito* ("district"), western Portugal. It lies on Cascais Bay, 17 miles (28 km) west of central Lisbon. The town, created (1364) by Pedro I, is now a fishing port and resort on the Portuguese Riviera. Its Chapel of Nossa Senhora da Vitória contains an image of St. Anthony that accompanied a local infantry regiment during the Peninsular War (1808-14) against the French. The 17th-century citadel is a residence of the Portuguese president. Prehistoric burial caves are nearby. Pop. (1991 prelim.) 19,482.

Cascina, town, Pisa *provincia*, Toscana (Tuscany) *regione*, central Italy. Local mineral springs are used to treat rheumatism. The town's Church of Santa Maria, built in Pisan style, dates from the 12th century. Cascina was a historic battleground in the Pisans' resistance against the Florentines, who sacked the town in 1364; remnants of its ancient ramparts are preserved. Furniture manufacture is an economically important industry, and there is a cabinetmaking school in the town. Pop. (1993 est.) mun., 36,562.

casebearer, any larva of the cosmopolitan moth family Coleophoridae (order Lepidoptera) of insects. The larvae are light brown with dark heads; they attack apple, birch, cherry, and willow trees, feeding first as leaf

Larval case of baccharis casebearer moth (*Coleophora vicidiflorella*)

William E. Ferguson

miners and then as casebearers. Their cases, which serve as camouflage and protection, are attached perpendicularly to branches, fruits, leaves, or twigs; the larvae protrude from them to feed. The cases, in which the larvae overwinter, are made from leaves, twigs, silk, and excrement. Typical case shapes vary from that of a cigar to that of a pistol. Most adults are pale brown or gray with a wingspan of less than 12 mm (0.5 inch). The narrow, pointed wings have a long fringe of hair.

casebearing beetle, any small, robust, cylindrical insect belonging to one of several subfamilies in the leaf beetle family Chrysomelidae—*e.g.*, Clytrinae, Cryptocephalinae, Chalamisinae, and Lamprosomatinae. The female covers each egg with a layer of excrement; after the larvae hatch, they retain this covering as camouflage and add to it.

When disturbed, the adults pull in their legs; because of their coloring and shape, they resemble caterpillar droppings and are ignored by predators. The European species *Clythra quadripunctata* and the North American *Coscinoptera dominicana* live in ant nests.

casein painting, painting executed with colours ground in a solution of casein, a phos-

phoprotein of milk precipitated by heating with an acid or by lactic acid in souring. In the form of homemade curd made from soured skim milk, it has been a traditional adhesive and binder for more than eight centuries. Refined, pure, powdered casein, which can be dissolved with ammonia, has been used for easel and mural paintings since the latter 19th and early 20th centuries, and, more recently, ready-made casein paints in tubes have come into very wide use. An advantage of casein

painting is that it can create effects that approach those of oil painting. It permits the use of bristle brushes and a moderate impasto, like oil painting, but not the fusion of tones. It is preferred by some because of speedy drying and matte effects. When dry, the paint becomes water resistant to a considerable degree. Casein paintings may be varnished to further resemble oil paintings, and they are frequently glazed or overpainted with oil colours. Because casein is too brittle for canvas, it must be applied to rigid boards or panels.

Casella, Alfredo (b. July 25, 1883, Turin, Italy—d. March 5, 1947, Rome), composer, pianist, conductor, and teacher whose cosmopolitan outlook permeated 20th-century Italian music.

Casella studied in Paris, where he remained until 1914. After touring as a pianist he returned to Italy in 1915. In 1917 he founded the National Society of Music, soon renamed the Italian Society of Modern Music, and he also helped to revive interest in early Italian music. He also published valuable editions of the keyboard works of J.S. Bach, W.A. Mozart, Ludwig van Beethoven, and Frédéric Chopin.

His early symphonies (1905-09) show some influence of Richard Strauss and Gustav Mahler and his later chamber and orchestral works that of Maurice Ravel and Igor Stravinsky. He established a more personal style in the ballet *La Giara* (1924; *The Jar*) and in the orchestral works *Scarlattiana* (1926) and *Paganiniana* (1942). Other notable works were *Italia* for orchestra (1910), the *Partita* for piano and orchestra (1925), and the *Missa solennis* (1944).

Casement, Sir Roger, in full SIR ROGER DAVID CASEMENT (b. Sept. 1, 1864, Kingstown [now Dún Laoghaire], County Dublin, Ire.—d. Aug. 3, 1916, London, Eng.), distinguished British public servant who was executed for

treason and became one of the principal Irish martyrs in the revolt against British rule in Ireland.

Casement was a British consul in Portuguese East Africa (Mozambique; 1895–98), Angola (1898–1900), Congo Free State (1901–04), and Brazil (1906–11). He gained international fame for revealing atrocious cruelty in the exploitation of native labour by white traders in the Congo and the Putumayo River region, Peru; his Congo report (published 1904) led to a major reorganization of Belgian rule in the Congo (1908), and his Putumayo report (1912) earned him a knighthood.

Ill health forced Casement to retire to Ireland in 1912. Although he came from an Ulster Protestant family, he had always sympathized with the predominantly Roman Catholic Irish nationalists. Late in 1913 he helped form the Irish National Volunteers, and in July 1914 he traveled to New York City to seek American aid for that anti-British force. After World War I broke out in August, Casement hoped that Germany might assist the Irish independence movement as a blow against Great Britain. On arriving in Berlin in November 1914, he found that the German government was unwilling to risk an expedition to Ireland and that most Irish prisoners of war would refuse to join a brigade that he intended to recruit for service against England.

Later, Casement failed to obtain the loan of German army officers to lead the Irish rising planned for Easter 1916. In a vain effort to prevent the revolt, he sailed for Ireland on April 12 in a German submarine. Put ashore near Tralee, County Kerry, he was arrested on April 24 and taken to London, where, on June 29, he was convicted of treason and sentenced to death. An appeal was dismissed, and he was hanged at Pentonville Prison despite attempts by influential Englishmen to secure a reprieve in view of his past services to the British government. During this time, diaries reputedly written by Casement and containing detailed descriptions of homosexual practices were circulated privately among British officials. After years of dispute over their authenticity, the diaries were made available to scholars by the British home secretary in July 1959. It was generally considered that the passages in question were in Casement's handwriting.

In 1965 Casement's remains were returned to Ireland and, after a state funeral, reinterred in Dublin.

BIBLIOGRAPHY. Brian Inglis, *Roger Casement* (1973); B.L. Reid, *The Lives of Roger Casement* (1976); Roger Sawyer, *Casement, the Flawed Hero* (1984).

casement window, earliest form of movable window, wood or metal framed, with hinges or pivots at the upright side of the vertically hung sash, so that it opens outward or inward along its entire length in the manner of a door. One frame, separately movable, of such a window is called a casement sash.

The British and German custom was to have the windows opening outward. A medieval English example exists at the Falstaff Inn, Canterbury, Kent, Eng., with casement windows below fixed windows, or lights, all composed of small leaded panes. The French casement commonly has two meeting leaves that open inward, requiring careful craftsmanship to prevent weather from penetrating them. These French casements were adapted in the United States chiefly as ways to give access onto balconies and porches, and in this doorlike form they are known as French windows, French doors, or casement doors.

Caserta, city, capital of Caserta *provincia*, Campania *regione*, southern Italy, north of Naples. The old town (Caserta Vecchia), founded by the Lombards in the 8th century, lies on hills 3 miles (5 km) north-northeast of the modern city, which was a village known as Torre belonging to the Caetani family of

Sermoneta until the construction there of the Bourbon Royal Palace in the 18th century. San Leucio, 2 miles (3 km) north, is a village founded by Ferdinand IV, king of Naples, in 1789; it has large silk factories. In the Italian Risorgimento (movement for political unity), the Battle of the Volturno (1860), in which the nationalist leader Giuseppe Garibaldi defeated

The Bourbon Royal Palace, Caserta, Italy

SCALA—Art Resource

the Neapolitan forces, was fought around Caserta. In World War II the royal palace served for a time as the headquarters of the Allied command, and the surrender of the German army in Italy was signed there on April 29, 1945. The palace (1752–74), with a richly decorated interior including a sumptuous chapel and theatre, stands in an extensive park with famous gardens.

On the main railway lines from Naples to Foggia and Rome, Caserta is an agricultural trade centre with food-processing and glass-making industries. Pop. (2001) 75,208.

Casey, William J., in full WILLIAM JOSEPH CASEY (b. March 13, 1913, Elmhurst, Queens, N.Y., U.S.—d. May 6, 1987, Glen Cove, N.Y.), powerful and controversial director of the U.S. Central Intelligence Agency (CIA) from 1981 to 1987 during the Ronald Reagan administration.

Casey graduated from Fordham University (B.S., 1934), studied at the Catholic University of America, Washington, D.C., and took a law degree from St. John's University, Jamaica, N.Y. (1937). After working for the private Research Institute of America, Washington, D.C., he served in Europe (1941–46) with the Office of Strategic Services (forerunner of the CIA), directing continental spies from London. After the war he lectured on tax law at New York University (1948–62), wrote legal and business books, and invested wisely enough to amass a fortune. He was also a partner in a New York law firm (1957–71), along with Republican Party leader Leonard Hall. After working on Richard M. Nixon's presidential campaign in 1968, Casey successively became chairman of the Securities and Exchange Commission (1971–73), under secretary of state for economic affairs (1973–74), president and chairman of the Export-Import Bank (1974–75), and member of the Foreign Intelligence Advisory Board (1976).

While affiliated with the law firm Rogers & Wells (1976–81), Casey became Reagan's presidential campaign manager and was subsequently awarded the directorship of the CIA in 1981. Under his leadership, covert action increased in such places as Afghanistan, Central America, and Angola, and the agency stepped up its support for various anticommunist insurgent organizations. He was viewed as a pivotal figure in the CIA's secret involvement in the Iran-Contra Affair, in which U.S. weapons were sold to Iran and money from the sale funneled to Nicaraguan rebels, in possible violation of U.S. law. Just before he was to testify in Congress on the matter in December 1986, he suffered seizures and then underwent brain surgery; he died from nervous-system lymphoma without ever testifying.

Cash, Johnny, byname of J.R. CASH (b. Feb. 26, 1932, Kingsland, Ark., U.S.—d. Sept. 12, 2003, Nashville, Tenn.), singer and songwriter whose work broadened the scope of American country and western music.

Cash, who learned to play guitar during military service in the early 1950s, began performing with the Tennessee Two (later Tennessee Three) and landed an audition with Sam Phillips of Sun Records, who signed him in 1955. Such songs as "Cry, Cry, Cry," "Hey, Porter," "I Walk the Line," and "Folsom Prison Blues" helped make Cash the top recording artist in the country and western field by 1957. His music was noted for its stripped-down sound and focus on the working poor and social and political issues. Cash, who usually wore black clothes and had a rebellious persona, became known as the "Man in Black."

In the 1960s Cash's popularity began to wane as he battled drug addiction problems, which would recur throughout his life. At the urging of June Carter (b. 1929—d. 2003) of the Carter Family (*q.v.*), with whom he had worked since 1961, he eventually sought treatment; the couple married in 1968. In the late 1960s Cash found a wider audience with his *Johnny Cash at Folsom Prison* album (1968), live appearances in New York and London, and television show (1969–71). The 1980s brought dwindling sales and public interest, but Cash experienced an unexpected resurgence after signing in 1994 with American Records, on which he released a series of albums, including *American Recordings* (1994), that won him a new generation of fans. The recipient of numerous honours, Cash earned 11 Grammy Awards and was inducted into the Country Music Hall of Fame (1980) and the Rock and Roll Hall of Fame (1992). His autobiographies *Man in Black* and *Cash* (cowritten with Patrick Carr) appeared in 1975 and 1997, respectively.

cash register, business machine that usually has a money drawer and is designed to record sales transactions. The typical cash register of the mid-20th century, through a system of keys, levers, and gears often electrically driven, indicated the amount of a transaction at the top of the register where it could be seen by both customer and salesperson; it also kept separate totals of sales by various classifications, printed and issued a receipt on cash sales or overprinted a record of the transaction on a docket for charge sales, and kept an audit strip within the register. Some types of machines automatically made change. Frequently, special counters in the register showed the number of customers and the number of transactions of different kinds.

Within a few years the combined electronic revolution and the increasing ubiquity of the digital computer in business operations had caused major manufacturers to convert from the mechanical cash register to an electroni-

cally operated device that performed the same functions, often driven by and sometimes feeding information into a computer, enabling instant credit checks, recording of transactions, and inventory control entries. Computer-driven cash registers often are equipped with an optical scanning device or a light pen that can read printed or coded price information and product description, recording it and printing it on the customer's receipt.

Cashel, Irish CAISEAL, town and urban district, County Tipperary, Ireland. It is dominated by the Rock of Cashel (358 feet [109 m]), a limestone outcrop on the summit of which is a group of ruins that include remains

Ancient round tower and Celtic cross atop the Rock of Cashel, County Tipperary
Colour Library International

of the town's defenses, St. Patrick's Cathedral (adjoined by a round tower and Cormac's Chapel), the bishop's castle, and an ancient cross. The rock was the stronghold of the kings of Munster from the 4th century. St. Patrick visited Cashel in about 450, baptized King Aenghus, and made Cashel into a bishopric. In 1101 the rock was granted to the church by King Murtagh O'Brien. Cormac's Chapel was built between 1127 and 1134, and the cathedral was founded in 1169 and then replaced by the present building in the 13th century. Cashel also has a Georgian cathedral (1784), the seat of the Protestant bishop. Pop. (1986) 2,458.

cashew, edible seed or nut of the species *Anacardium occidentale* (family Anacardiaceae), a tropical and subtropical evergreen shrub or tree. Where the soil is fertile and the humidity high, the plant may grow to 12 m (40 feet) in height. The tree is chiefly important for the

Cashew apples and nuts (*Anacardium occidentale*)
WH Hodge

nuts it produces, but it produces wood used for shipping crates, boats, charcoal, etc., and a gum similar to gum arabic. The species is related to the American poison ivy and poison sumac and must be handled with care by susceptible individuals.

The nut, shaped like a large, thick bean, is sometimes more than 2.5 cm (1 inch) long and forms in an unusual way. It appears as though one of its ends had been forcibly sunk into the calyx end of a pear-shaped, swollen stem, called the cashew apple, which is about three times as large as the nut and reddish or yellow. The cashew apple is used locally in beverages, jams, and jellies. The nut has two walls, or shells, the outer smooth and glasslike over the surface, thin and somewhat elastic but stout, and olive green until maturity, when it becomes strawberry roan. The inner shell is harder and must be cracked like the shells of other nuts. A brown oil between the shells blisters human skin and is used as a lubricant and an insecticide and in the production of plastics. The cashew, rich and distinctively flavoured, is a characteristic ingredient of numerous chicken and vegetarian dishes of southern India.

The fruits are picked by hand, and the nuts are first detached, then sun dried. In some localities the dried nuts are roasted by being placed among burning logs, where the heat causes the outer shells to burst open and release the oil. The oil quickly catches fire, giving off fumes injurious to the eyes and skin. In improved methods of roasting, the poisonous properties are dispelled in roasting cylinders. Later, the inner shells are broken open by hand and the kernels heated to remove the skins.

The cashew is native to tropical Central and South America. Portuguese missionaries took it to East Africa and India during the 15th century, where it became abundant at low altitudes near the seacoast.

cashmere, animal-hair fibre forming the downy undercoat of the Kashmir goat and belonging to the group of textile fibres called specialty hair fibres. Although the word cashmere is sometimes incorrectly applied to extremely soft wools, only the product of the Kashmir goat is true cashmere.

The fibre, known as pashm or pashmina in some parts of Asia, became known for its use in beautiful shawls and other handmade items produced in Kashmir, India. In the early 19th century cashmere shawls reached their greatest popularity, and the shawls of England, France, and the town of Paisley, Scot., were made to imitate the original Kashmir shawls.

The cashmere goat has a protective outer coat of coarse fibre that is 4 to 20 cm (1.5 to 8 inches) in length. The downy undercoat is made up of the fine, soft fibre commonly called cashmere, which ranges from 2.5 to 9 cm (1 to 3.5 inches) long. Most of this down fibre is plucked or combed out by hand during the molting season. Iranian cashmere, however, is obtained by shearing. The annual yield per animal ranges from a few grams to about 0.5 kilogram. A sweater requires the fleece of 4 to 6 goats; an overcoat uses the production of 30 to 40. Some fibre, called pulled cashmere, is taken from the skins of slaughtered animals.

The fleece is cleaned to remove such impurities as grease and vegetable matter. Coarse hairs are removed by various mechanical dehairing processes that are frequently kept secret by their developers. Processing reduces the final yield by about 50 percent. The amount of coarse hair remaining greatly affects price, with fibre having the lowest hair content commanding the highest price. High-quality cashmere-coating fabrics usually contain less than 5 percent of the coarse hair; fine-quality sweaters contain less than 1 percent. The scales forming the outer layer, or epidermis, of the fine fibre are less distinct than those of wool although more definite than in mohair; the cortical layer is striated and contains varying amounts of pigment that produce the fibre colour; and there is no distinct medulla (central canal). The fibres have

diameters finer than those of the best wools. The Kashmir goats of China and Mongolia yield fibre with diameters ranging from 14.5 to 16.5 micrometres; that of Iranian goats is 17.5 to 19.5 micrometres. Colour, usually gray or tan, varies from white to black.

Fabric made of cashmere is warm and comfortable to the wearer, and it has excellent draping qualities and soft texture. The fibre, which absorbs and retains moisture much like wool, is somewhat weaker than fine wool and considerably weaker than mohair. It is highly susceptible to damage by strong alkalis and high temperatures. Dark fibres are bleached to obtain light shades, although the process may reduce strength and softness. Cashmere fabrics are subject to abrasion in wearing; pilling, or bunching together of surface fibres, is a problem in knitwear.

Cashmere is used mainly for fine coat, dress, and suit fabrics and for high-quality knitwear and hosiery. It is sometimes blended with other fibres. The strong, coarse hair separated from the down is used locally for grain bags, ropes, blankets, and tent curtains. Because world production is so small and gathering and processing are costly, cashmere is a luxury fibre. Demand and, consequently, price are affected by fashion trends. New man-made fibres with similar texture and fineness, produced at much lower cost, have become a source of competition.

The major producers of cashmere are China, Mongolia, and Iran. Cashmere is also produced on the Indian subcontinent and in Afghanistan and Turkey. The United States, the United Kingdom, and Japan are leading consumers.

cashoo (plant extract): *see* catechu.

Casimir, also spelled CAZIMIR, KASIMIR, or KAZIMIR, Polish KAZIMIERZ, name of Polish dukes and kings grouped below chronologically and indicated by the symbol ●.

● **Casimir I**, byname CASIMIR THE RESTORER, OF THE MONK, Polish KAZIMIERZ ODNOWICIEL, or MNICH (b. July 25, 1016—d. at latest Nov. 28, 1058), duke of Poland who reannexed the formerly Polish provinces of Silesia, Mazovia, and Pomerania (all now in Poland), which had been lost during his father's reign, and restored the Polish central government.

Only surviving son of Duke Mieszko II and Richeza (Ryksa) of Palatine Lorraine, Casimir I, who had taken monastic orders, received papal dispensation and ascended the throne after his father's death (1034). In 1037 he was deposed; maneuvers of the magnates against his supremacy coincided with a popular revolt against the landowners and with an anti-Christian uprising by pagan tribes. Exiled to Germany, he won military aid from the German kings Conrad II and Henry III and by 1040 had regained his throne. He married the Russian princess Dobronega and, supported by her brother, the grand prince Yaroslav the Great of Kiev, regained the provinces of Mazovia and Pomerania in 1047. He took Silesia (1050) from the Bohemians, though he had to pay annual tribute to the Bohemian princes as compensation.

Casimir reestablished the Polish central government, revived the Roman Catholic church, and suppressed the pagan tribes that had helped to depose him. As ruler of Poland, however, he was never crowned king, and German suzerainty over Poland was, in fact, reestablished during his reign.

● **Casimir II**, byname CASIMIR THE JUST, Polish KAZIMIERZ SPRAWIEDLIWY (b. 1138—d. May 5, 1194), duke of Kraków and of Sandomierz from 1177 to 1194. A member of the Piast dynasty, he drove his brother Mieszko III from the throne and spent much of his reign fighting him. Mieszko actually regained power briefly in 1190–91, retaking Kraków. Casimir became Poland's most powerful ruler

and, at the Congress of Lenczyca (1180) was so recognized by the nobility and clergy, who, in exchange for privileges, vested hereditary rights in his descendants. He was succeeded by his son Leszek I, who spent years in battle against other claimants.

• **Casimir III**, byname **CASIMIR THE GREAT**, Polish **KAZIMIERZ WIELKI** (b. April 30, 1310, Kujavia, Pol.—d. Nov. 5, 1370), king of Poland from 1333 to 1370, called “the Great” because he was deemed a peaceful ruler,

Casimir III, sarcophagus figure, after 1370; in Wawel Cathedral, Kraków

By courtesy of Państwowe Zbiory Sztuki na Wawelu, Kraków

a “peasant king,” and a skillful diplomat. Through astute diplomacy he annexed lands from western Russia and eastern Germany. Domestically he unified the government, codified its unwritten law, endowed new towns with the self-government of the Magdeburg Law, and founded Poland’s first university.

Casimir was the second king of the reunited and resuscitated Poland that for nearly two centuries had been split up into numerous small principalities. His father, Wladyslaw I, who had succeeded in reuniting Great Poland and Little Poland, renewed the long-forgotten kingship with his coronation in Kraków in 1320. Casimir continued the work of his father, adding two large and important regions (Red Russia and Masovia) to the country and making it a solid and respected partner among the other 14th-century powers in central Europe. In addition, he provided the country with a well-organized government, and thus so strengthened feelings of popular unity that after his death (although he left no legal heir) there were no attempts at restoring the former duchies and principalities. His mother was Jadwiga, daughter of Boleslaw the Pious (Pobożny) of Great Poland. After the death of his elder brother in 1312, Casimir was regarded as heir and was prepared for the kingship by Jaroslaw, later archbishop of Gniezno and Casimir’s counsellor. Of his three sisters, one, Elizabeth, who in 1320 married King Charles Robert of Hungary, figured prominently in his foreign and dynastic policy.

Dynastic alliances. In 1325 Casimir married Aldona-Ona, the pagan daughter of Gediminas (Giedymin), duke of Lithuania. Baptized before the wedding, Aldona brought with her thousands of Polish prisoners of war (one chronicle tells of 24,000) as a sign of reconciliation between Poland and the then still heathen Lithuania. The marriage seems to have been unhappy, and the Queen died in 1339 leaving no sons. Two years later Casimir married a German princess, Adelheid of Hesse, but this marriage proved barren, and Adelheid was sent home in 1356. A third marriage in 1365 with the Silesian princess Hedwig of Glogau-Sagan still brought no legal heir. The question of a successor was, therefore, one of Casimir’s main problems. He finally designated as his heir his nephew, Louis of Hun-

gary. Since Louis had no sons either, Casimir named as his second choice Casimir of western Pomerania, a son of his eldest daughter. The act strengthened the position of the nobility, whose consent had to be obtained by the granting of privileges.

The marriages of his daughters and grandchildren further strengthened Casimir’s foreign support. His second daughter was married to Louis of Brandenburg (1345); the third was betrothed to Wenzel, son of the Holy Roman emperor Charles IV (1369), and the Emperor himself married first a grandniece and, later, a granddaughter of Casimir. The King thus had relatives in several important contemporary dynasties: the Wittelsbachs, the Anjous, the Luxemburgs, and the Lithuanians (later known as the Jagiellons). Casimir also had many mistresses, about whom little is known; the most famous of them, the beautiful Jewess, Esther, may have been invented by the chroniclers to explain the King’s notable friendliness toward the Jews.

Foreign policy. Casimir’s foreign policy reflected his own character: prudent, cool, obstinate, and self-controlled. He preferred diplomacy to war, though he did not entirely refrain from the latter, as shown by a series of forced occupations of foreign territory, notably Red Russia, in 1340 and 1349. At the beginning of Casimir’s reign Poland was beset by several difficulties: the King of Bohemia claimed the Polish crown; the German knights of the Teutonic Order disputed East Pomerania; and the country lacked powerful allies. By a series of treaties concluded with Hungary, Bohemia, and the Teutonic Order between 1335 and 1348, Casimir obtained a strong ally in Hungary and dropped his claims to Silesia and East Pomerania (claims that would in any case have been difficult to realize). The Bohemian king, in exchange, dropped his claims to Poland; and the Order withdrew from the territories of Kujavia and Dobrzyn, which it had occupied. Having his western frontier secure, Casimir was now able to occupy the former duchies of Halič and Vladimir (Red Russia) and to unite them step-by-step (though never completely) to Poland. As a result of this carefully planned policy, the Masovian princes, long anxious to preserve their independence, declared themselves Casimir’s vassals (1351–53); even in the West some German nobles preferred Casimir’s to Brandenburg’s lordship.

By 1370 Casimir, under different titles, had increased his territory to about 90,000 square miles (233,000 square kilometres) from about 50,000 at his accession. More important than these territorial gains, some of which were lost after Casimir’s death, was the growth of the King’s prestige throughout Europe. A congress held in Kraków in 1364 was attended by the kings of Hungary, Bohemia, Denmark, and Cyprus, as well as a great number of other princes. Casimir, who 30 years previously had been a humble petitioner at the Congress of Visegrád in Hungary, was now asked to arbitrate a quarrel between the Emperor and Louis of Hungary.

Domestic achievements. Domestically, Casimir encouraged economic activity and attempted to unite the country under one prince, one law, and one currency. He founded several new towns—two of them named Kazimierz after himself—and gave them, together with already existing towns, the so-called Magdeburg Law, the privilege of self-government. Casimir built more than 50 castles, fostered church building, and embellished the royal castle at Kraków. A special court was established in Kraków to arbitrate in all quarrels and to administer the law codified in the *Liber juris Teutonici* (“Book of Teutonic Law”). The former privileges of the Jews were confirmed and improved. Though Casimir was able to inaugurate his principle of one law in Little Poland and Great Poland, Masovia and Red Russia kept their own nonwritten

law. Wishing to educate native lawyers and administrators, he founded the University of Kraków in 1364, which, however, flourished for only a few years before his death in a hunting accident in 1370.

Since little is known of Casimir’s sympathies, personal interests, thoughts, and feelings, he must be judged on his deeds, which characterize him as an especially good, wise, and, to a degree, even modern ruler. He was a sober administrator but not a hero; a man who earned the respect of his contemporaries and posterity but was, perhaps, too cool, too aloof, and too faultless to obtain great sympathy.

(G.K.S.R.)

• **Casimir IV**, byname **CASIMIR JAGIELONIAN**, Polish **KAZIMIERZ JAGIELLOŃCZYK** (b. Nov. 30, 1427—d. June 7, 1492), grand duke of Lithuania (1440–92) and king of Poland (1447–92), who, by patient but tena-

Casimir IV, sarcophagus figure by Veit Stoss; in Wawel Cathedral, Kraków

By courtesy of Państwowe Zbiory Sztuki na Wawelu, Kraków

cious policy, sought to preserve the political union between Poland and Lithuania and to recover the lost lands of old Poland. The great triumph of his reign was the final subjugation of the Teutonic Knights (1466).

Casimir was the second son of Wladyslaw II Jagiello and his fourth wife, Zofia Holszańska. His father was already over 75 at Casimir’s birth, and his brother Wladyslaw III, three years his senior, was expected to become king before his majority. Casimir was thus the second in succession to the throne, and, after Wladyslaw had succeeded his father in 1434, he became the legal heir. Strangely, little was done for his education; he was never taught Latin, nor was he trained for the responsibilities of office, despite the fact he was the only brother of the sovereign. Yet the necessity of taking office was thrust upon him in 1440, when the grand duke of Lithuania, Sigismund, was murdered. The boy was sent to Wilna to act as governor for his brother, but he was proclaimed grand duke in a coup d’etat by the leading boyars (nobles), who evidently hoped to use him as a convenient tool.

The coup practically severed the ties between Lithuania and Poland, but these were restored after Wladyslaw III’s death in the Battle of Varna against the Turks (Nov. 10, 1444). The Poles, having to elect a new king, had no other candidate but Casimir. The young man, despite his lack of experience, knew how to wield his new power. He acted to preserve the hereditary rule of the dynasty in Lithuania with no connection with Poland other than the common monarchy, and, when he was finally crowned king of Poland (June 25, 1447), he had succeeded in affirming his right to live in Lithuania and choose his counsellors freely. Considering his deeds and policy

(no personal utterances of his are recorded), it may be inferred that he regarded himself more as the head of a dynasty than as the elected king of Poland. His policy, therefore, was partly family policy, and in cases of conflict between dynasty and state the former had priority. His marriage to Elizabeth of Habsburg in 1454 had clear political aims; as the daughter of Albert II of Habsburg, Elizabeth had claims to Bohemia and Hungary. In fact, this first connection between the Habsburgs and the Jagiellons was a happy one; because of her six sons and seven daughters (born between 1456 and 1483), Elizabeth was called the "mother of Jagiellons." Casimir did everything he could to provide his children with advantageous marriages. In this he was more than successful: his eldest son, Wladyslaw, became king of Bohemia (1471) and of Hungary (1490); three others were his successors on the thrones of Lithuania and Poland; one became an archbishop and, later, a cardinal. Five of his daughters were married to German princes, as a result of which the Polish name Casimir became a familiar one among German dynasties. When he died he left a dynasty renowned among the courts of Europe.

In foreign policy, Casimir had few far-reaching plans or great ambitions. He neither organized a crusade against the Turks as his brother had done, nor did he build up an efficient defense system against the aggressions of the grand duchy of Moscow. He failed also to support Moscow's enemies and contented himself with the favourable treaty of 1449, which, however, did little to prepare Lithuania for the attacks that were to begin in 1486. Thus, a number of Russian princes, vassals of Lithuania, went over to the Muscovite grand duke after 1486 because they had obtained no protection from Casimir.

Similarly, in Poland the king showed little initiative in foreign policy. When the Prussians, however, revolted in 1454 against their overlord, the Teutonic Order, and placed themselves under the protection of Casimir, he was aware that this was a unique opportunity to destroy the power of the order. In October 1453 the cities and gentry of Prussia, in a dispute with the order (which had been excommunicated by the pope and put under the ban of the Holy Roman Empire), placed themselves under Casimir's overlordship. Subsequently, in February 1454, they renounced their allegiance to the order. They then captured 57 towns and castles, and on March 6, 1454, Casimir incorporated all of Prussia with Poland, with a guarantee of autonomy and of freedom from taxation. When, as a result, war broke out and Polish troops were severely defeated by the order near Konitz (Sept. 18, 1454), it was mainly Casimir's perseverance and stubbornness that led eventually to success after a bloody victory at Puck (Sept. 17, 1462). The papacy finally intervened, and by the second Treaty of Toruń (Thorn; Oct. 19, 1466), all of western Prussia, called "Royal Prussia," was ceded to Poland, while the remainder of Prussia was held by the Teutonic Order as a fief of the Polish crown. Though the order thus retained a part of its former territory and "Royal Prussia" was not formally incorporated but only united with the Polish kingdom while preserving its own diet and administration, this treaty was Casimir's most important foreign policy success.

In domestic affairs Casimir was relatively passive but anxious to preserve the prerogatives of the crown, notably his right to nominate bishops. In the question of territories in dispute between his two states (Volhynia and Podolia) he favoured Lithuania. During the war against the Teutonic Order he was forced to grant the Polish nobility substantial concessions by the Privilege (statute) of Nieszawa

(November 1454); these, however, became important only after his death, and royal power was not greatly diminished during his lifetime.

Casimir was neither a splendid ruler nor a good and wise administrator, but a mistrusting, cautious, and sober head of a large family who regarded Lithuania as his personal estate. His reign was remembered as being both successful and peaceful. (G.K.S.R./Ed.)

Casimir-Périer, Jean, in full JEAN-PAUL-PIERRE CASIMIR-PÉRIER (b. Nov. 8, 1847, Paris, France—d. March 11, 1907, Paris), French politician and wealthy businessman who served brief and undistinguished terms as a premier and as the fifth president of the Third Republic.

The son of a former minister of the interior, he served as a captain during the Franco-German War (1870–71). In 1876 he was elected to the Chamber of Deputies as a Left Republican from Aube *département*, serving as the chamber's vice president (1890–92) and president (1893). On Dec. 4, 1893, he formed his own cabinet, which fell within six months because of his inability to cope with anarchist terrorism and the vexing church-state issue.

Casimir-Périer returned to the presidency of the chamber (June 1894) and in the wake of the assassination of Sadi Carnot was elected (June 27, 1894) president of the Third Republic. Unable to control his premier, Charles-Alexandre Dupuy, and faced with the mounting fury of the Dreyfus Affair, he quickly became a target for the political left. His most vigorous assailant, the journalist Gérauld-Richard, was convicted of slander, but then the Socialist leader Jean Jaurès picked up the cudgel. Gérauld-Richard's release by the Chamber of Deputies proved so embarrassing that, after only six months in office, Casimir-Périer resigned, abandoning politics to become chairman of the vast Anzin mining enterprise, of which he was one of the largest shareholders.

casino, originally, a public hall for music and dancing; by the second half of the 19th century, the term meant essentially a collection of gaming or gambling rooms.

The classic example of a casino, and for long the world's best-known one, is the casino at Monte-Carlo, which was opened in 1861. The casino has long been a major source of income for the principality of Monaco.

The 20th-century casino, which may also be called a gambling, or gaming, house or club, is a place where gamblers can risk their money against a common gambler, called the banker, or the house. Casinos have almost a uniform character throughout the world. In Europe and South America, they are permitted at many or most holiday resorts and not elsewhere. In the United Kingdom, licensed and super-

vised gambling clubs, mainly in London, have operated since 1960. Club membership is required and easily obtainable. Casinos are also regulated by the government in France, which boasts the majority of European casinos, including those at Cannes, Nice, Divonne-les-Bains, and Deauville-les-Bains. Other famous European casinos are found at Estoril, Port.; Corfu, Greece; and Baden-Baden and Bad Homburg von der Höhe, Ger. In the United States, legal casinos were long operated only in Las Vegas and other locations in Nevada, where various forms of commercialized gambling were permitted. The economy of Las Vegas is almost entirely dependent on the large, luxurious casinos that have operated there since the late 1940s. Casino gambling was introduced in Atlantic City, N.J., in 1878, and from the 1980s casinos also began appearing on various American Indian reservations, which are not subject to state antigambling statutes. Other legal casinos are located on riverboats; in Deadwood, S.D.; and by special license in Puerto Rico. A general expansion of casino gambling was underway in the United States by the last decade of the 20th century. In South America, there are casinos in Argentina, Colombia, and Ecuador. The casino at Havana, Cuba, was closed after the revolution in 1959.

The casino typically accepts all bets made by its patrons within a limit established so that a patron cannot win more than the casino can afford to pay. Every game offered gives the casino a mathematical expectancy of winning, and it is unlikely that a casino might lose money on its games, even for one day. Because of this virtual assurance of gross profit, casinos regularly offer big bettors extravagant inducements in the form of free spectacular entertainment, transportation, and elegant living quarters. Even lesser bettors are offered reduced-fare transportation, hotel rooms, free drinks and cigarettes while gambling, and other inducements. Such promotional expenses may exceed profits and cause a net loss over the year.

Of the games played regularly at casinos, roulette is found throughout the world, being a principal gambling game in France, where the casinos reduce their advantage to less than 1 percent to entice big bettors. In the Americas, roulette appeals more to small bettors, and the casinos take a larger percentage. Crap shooting attracts the big bettors in American casinos, most of which demand an advantage no greater than 1.4 percent, some only 1 percent or less. Slot machines and (from the 1980s) video poker machines are the economic mainstay of American casinos, the income resulting from high volume, rapid play at sums ranging from five cents to one dollar, and the ability to adjust machines for any desired profit.

Of casino card games, baccarat, in its popular form *chemin de fer*, is the principal gambling game in the United Kingdom and those European continental casinos most often patronized by the British, such as those at Deauville, Biarritz, and on the Riviera. Blackjack is a fixture in American casinos and *trente-et-quarante* in the French. Other card games are seldom played in casino gambling, although most American casinos have a poker table.

Casino, also spelled **CASSINO**, card game for two to four players, best played with two. A 52-card deck is used. In the two-handed game the dealer gives his opponent two cards, deals two face up on the table, and gives two to himself. He repeats this, giving himself, his opponent, and the table a total of four cards each. No further cards are dealt to the table.

The goal is to take in cards from the table. A card from the hand may take all others of the same rank on the table; called *pairing*, it is the only way face (court) cards can be taken. A

Casino at Monte-Carlo, Monaco, designed by Charles Garnier, 1879

J. Allan Cash

card the numerical value of which equals that of two cards on the table (a 10, and 6 and 4) can take in those cards; this is called combining. A 10, for example, can take any 10 face up, as well as a 6, 3, and ace (1). Cards may also be won by building; a card is played to the table to form an announced combination that can be captured by another hand card on the next turn. The opponent may take the build if he has the necessary card. When a player is unable or unwilling to take in, he places a card from his hand on the table face up; this is called trailing. After the first four cards are played, the dealer deals four more to his opponent and himself, successively, until all cards are dealt.

After all the cards in the deck have been dealt, each player totals the points in his hand. The suits of the cards have no point significance, except to capture spades and two special cards: big casino—the 10 of diamonds—and little casino—the 2 of spades; only the number of cards held at the exhaustion of the deck counts. Points are scored as follows: the hand having the most cards, 3; the most spades, 1; big casino, 2; little casino, 1; and each ace, 1. Game is usually 11 or 21.

Three-handed Casino follows the same rules as two-handed. In partnership Casino, four play in two partnerships.

Casiquiare, also spelled *CASSIQUIARE*, navigable waterway in southern Venezuela. It branches off from the Orinoco River downstream from La Esmeralda and meanders generally southwestward for approximately 140 miles (225 km), joining the Guainía River to form the Negro River, a major affluent of the Amazon, across from Sardina, Colombia.

Casket Letters, the eight letters and a series of irregular sonnets asserted by James Douglas, 4th Earl of Morton, to have been found by his servants in a silver casket in the possession of a retainer of James Hepburn, 4th Earl of Bothwell, on June 20, 1567, six days after the surrender of Mary, Queen of Scots, to her rebels at Carberry Hill. If they are genuine—particularly Letter II, or the Glasgow letter—they prove Mary's full complicity with Bothwell in the murder of her husband, Henry Stewart, Lord Darnley, in the preceding February.

The contents of the casket were produced at Westminster, on Dec. 14, 1568, before a body of English commissioners appointed by Queen Elizabeth I to investigate the charges brought by Mary, then a prisoner in England, against the rebel Scottish lords and by them against her. The originals were in French, but translations had already been made into Scottish Gaelic, and further translations were made into English. After the conference, the casket and its original contents were brought back to Scotland and entrusted to Morton's care; a few years after the execution of Morton in 1581, they disappeared—possibly at the hands of Mary's son, James VI.

Whether the letters were authentic or forged preoccupied historians for centuries, with no conclusive results. Even if the letters were completely spurious, however, other circumstantial evidence may be sufficient to indicate Mary's guilt.

Čáslavská, Věra (b. May 3, 1942, Prague, Czech. [now in Czech Republic]), Czech gymnast who won a total of 35 medals, including 22 gold medals, at the Olympic Games and in world and European championships in the 1950s and '60s.

Čáslavská began her athletic career as a figure skater, but at the age of 15 she turned to gymnastics, first appearing in international competition at the 1958 world championships, where she won a silver medal in the team event. She won the European title on the balance beam in the 1959 world championships and finished a close second to the Soviet gymnast Larissa

Latynina at the 1962 world championships. Čáslavská placed first overall in gymnastics at the 1964 Olympics at Tokyo, also taking gold medals in the beam and the vault. In the 1965 and 1967 world championships she won every gymnastic event. At the 1966 world championships she contributed to the Czech team's victory over the Soviets, winning the gold in the combined exercises. She closed her career spectacularly in the 1968 Olympic Games at Mexico City, winning four gold medals—in the individual combined exercises and for the uneven bars, the floor exercises, and the vault—and three silver medals—as a member of her team for the combined exercises and for the beam and the floor exercises. After the games she married the Czech middle-distance runner Josef Odložil.

Caslon, William (b. 1692, Cradley, Worcestershire, Eng.—d. Jan. 23, 1766, Bethnal Green, London), English typefounder who, between 1720 and 1726, designed the typeface that bears his name. His work helped to modernize the book, making it a separate creation rather than a printed imitation of the old hand-produced book.

Caslon began his career as an apprentice to an engraver of gunlocks and barrels. In 1716 he opened his own engraving shop in London and soon began to make tools for bookbinders and silver chasers. When his work came to the attention of the printer John Watts, Caslon was given the task of cutting type punches for various presses in London. In 1720 he designed an "English Arabic" typeface used in a psalter and a New Testament. Two years later he cut excellent roman, italic, and Hebrew typefaces for the printer William Bowyer; the roman typeface, which was first used in 1726, later came to be called Caslon. The success of Caslon's new typefaces in England was almost instantaneous, and, as a result, he received loans and sufficient trade to enable him to set up a complete typefoundry. From 1720 to 1780, few books were printed in England that did not use type from his foundry.

Caslon's first specimen sheet was issued in 1734 and exhibited his roman and italic types in 14 different sizes. His types eventually spread all over Europe and the American colonies, where one of his fonts was used to print the Declaration of Independence. Caslon's typefaces combined delicate modeling with a typically Anglo-Saxon vigour.

After 1735 Caslon's eldest son, William (1720–88), joined him and by about 1742 had become a partner. Though the son lacked his father's great abilities, he maintained the reputation of the firm and, with the aid of his wife, Elizabeth, managed it skillfully. After William's death in 1788, the original Caslon & Son foundry was divided among his heirs.

Casnewydd (Wales): see Newport.

Caso y Andrade, Alfonso (b. Feb. 1, 1896, Mexico City, Mex.—d. Nov. 30, 1970, Mexico City), Mexican archaeologist and government official who explored the early Oaxacan cultures and is best remembered for his excavation of Tomb Seven at Monte Albán, the earliest-known North American necropolis.

Caso y Andrade studied at the University of Mexico and subsequently served on its faculty from 1918 to 1940. He headed the department of archaeology at the National Museum in 1930–33 and was director of the museum itself in 1933–34.

From 1931 to 1943 Caso directed excavations at the site of the ancient Zapotec city of Monte Albán, in Oaxaca state. His discovery and analysis of the burial offerings at Tomb Seven proved that Monte Albán had been occupied by the Mixtec people after they had displaced the Zapotecs in the locality some time before the Spanish conquest. Caso gathered evidence pointing to five major phases in Monte Albán's history dating back to the

8th century BC, and he was able to establish a rough chronology of that history through correlations with other sites. His other celebrated accomplishment was the deciphering of the Mixtec Codices.

Caso held various posts in the government from 1946, including that of director (1949–70) of the National Institute for Indian Affairs.

Casper, city, seat (1890) of Natrona county, east-central Wyoming, U.S., on the North Platte River. It originated around Fort Caspar at the site of a pioneer crossing on the Oregon Trail and the Pony Express route. The fort, now restored, was named for Lieutenant Caspar Collins, slain by Indians while trying to rescue a stranded wagon train. Founded in 1888 as a tent town prior to the arrival of the Chicago and North Western Railway, Casper was the misspelling of the railroad clerk who filed the plat. In the 1890s the Salt Creek Oil Field, just north, gave the town its start in the oil business. The oil fields include Teapot Dome, centre of the scandal that rocked the administration of President Warren G. Harding in 1922.

Casper's economy is based on the production of oil and natural gas and the manufacture of oil-field equipment, augmented by mining (uranium, coal, bentonite) and cattle and sheep raising. The city is the trading centre for a large hinterland and is the seat of Casper College (1945). Casper Mountain Park and Medicine Bow National Forest are to the southeast. The Central Wyoming Fair and Rodeo is held in August. Memorabilia of frontier days are displayed at the Old Fort Caspar Museum. Inc. town, 1889; city, 1917. Pop. (1991 est.) city, 47,402; Casper MSA, 62,089.

Caspersson, Torbjörn Oskar (b. Oct. 15, 1910, Motala, Swed.), Swedish cytologist and geneticist who initiated the use of the ultraviolet microscope to determine the nucleic acid content of cellular structures such as the nucleus and nucleolus.

Caspersson received his M.D. from the University of Stockholm in 1936, served from 1944 to 1977 as medical director of the Nobel Institute for Medical Cell Research and the Wallenberg Laboratory for Experimental Cell Research in Stockholm, and from 1977 was professor and head of the medical cell research and genetics department of the Faculty of Medicine of the Royal Karolinska Medical-Surgical Institute in Stockholm.

In *Cell Growth and Cell Function* (1950) Caspersson summarized much of his research by theorizing that nucleic acids must be present for protein synthesis to occur. He was the first to perform cytochemical studies on the giant chromosomes found in insect larvae. He also investigated the role of the nucleolus in protein synthesis and examined the relationship between heterochromatin quantity (the amount of a chromosome with few or no genes) and the rate of growth of cancer cells.

Caspian Depression, Russian *PRIKASPIYSKAYA NIZMENNOST*, flat lowland, Kazakhstan and Russia, much of it below sea level at the north end of the Caspian Sea. It is one of the largest such areas in Central Asia, occupying about 77,220 square miles (200,000 square km). Both the Ural and Volga rivers flow through the depression into the Caspian. Rainfall is sparse, from 6 to 8 inches (150 to 200 mm) in the south to about 12 inches in the north. Only isolated oases are intensively cultivated; there is some sheep grazing. The region includes the important Emba River oil fields; large amounts of salt are also extracted.

Caspian Sea, Russian *KASPIYSKOYE MORE*, Persian *DARYAYE KHEZER*, world's largest in-

land sea, lying east of the Caucasus Mountains at Europe's southeasternmost extremity and dominating the huge, flat expanses of western Central Asia.

A brief treatment of the Caspian Sea follows. For full treatment, see MACROPAEDIA: Asia.

The elongated basin of the Caspian Sea sprawls for nearly 750 miles (1,200 km) from north to south, although its average width is only 200 miles (320 km). Its area is approximately 149,200 square miles (386,400 square km). About 20 percent of the sea's shoreline, in the south, borders Iran at the foot of the Elburz Mountains; the remainder of the shoreline, once controlled by the former Soviet Union, is divided among Azerbaijan, Russia, Kazakhstan, and Turkmenistan. The three major rivers flowing into the Caspian are the Volga, Ural, and Terek, all of which enter the sea from the north; their combined annual flow accounts for approximately 88 percent of all river water entering the sea.

The Caspian possesses as many as 50 islands, most of them quite small. Its basin is generally divided into the north, middle, and south Caspian, based largely on seabed relief. The flat, sedimentary plain of the north Caspian is the shallowest portion of the sea, with an average depth of 13 to 20 feet (4 to 6 m). The middle Caspian forms an irregular depression with an abrupt western slope and a gentler eastern gradient. A depression reaching a maximum depth of 3,363 feet (1,025 m) dominates the south Caspian.

The northern Caspian Sea lies in a moderately continental climatic zone, while all of the middle and most of the south Caspian lies in the moderately hot belt. Evaporation from the sea surface is very high, reaching as much as 40 inches (1,000 mm) per year.

Long-term fluctuations in the area and depth of the Caspian have been recorded over the centuries, the lower levels being the result of climatic change affecting river inflow and causing increased evaporation. These conditions were compounded in the 20th century by reservoir construction on the Volga River and by river-water consumption and diversion for irrigation and industry. The Caspian's level fell consistently from the late 1920s to the late '70s, after which it rose rapidly, possibly owing to changing weather patterns that increased precipitation in the region. The rising sea flooded many areas that had been populated during the years of its decline.

The Caspian long has been famous for its large catch of sturgeon, but overfishing, worsening pollution, and the damming of feeder rivers have substantially reduced their numbers. Oil and natural gas have become the region's most important resources since World War II. The Caspian is also of great importance in the transportation networks of the region. Its chief ports are Baku, Azerbaijan; Makhachkala and Astrakhan, Russia; Aqtau (formerly Shevchenko), Kazakhstan; Türkmenbashi (formerly Krasnovodsk), Turkmenistan; and Bandar-e Anzali, Iran.

Cass, Lewis (b. Oct. 9, 1782, Exeter, N.H., U.S.—d. June 17, 1866, Detroit, Mich.), U.S. Army officer and public official who was active in Democratic politics in the mid-19th century. He was defeated for the presidency in 1848.

During the War of 1812 Cass rose from the rank of colonel of volunteers to brigadier general in the regular army. He was governor of Michigan Territory from 1813 to 1831. As secretary of war in President Andrew Jackson's cabinet (1831–36), he directed the conduct of the Black Hawk and Seminole wars. For the next six years he served as minister to France.

As a member of the U.S. Senate (1845–48, 1849–57), Cass became a leader of the 1846

bloc demanding the "reannexation" of all the Oregon country south of latitude 54°40' N or war with England. He supported President James K. Polk's administration during the Mexican War (1846–48) and opposed the Wilmot Proviso, an antislavery proposal applying to land acquired from Mexico.

Cass, daguerreotype

By courtesy of the Chicago Historical Society

In the 1848 presidential campaign, Cass was the Democratic nominee but was defeated by the Whig candidate, Zachary Taylor. He served as secretary of state (1857–60) under President James Buchanan, but he retired from the post when the president refused to take a firmer stance against the secession of the Southern states.

cassabanana, also called CURUBA (*Sicana odorifera*), perennial vine of the gourd family (Cucurbitaceae), native to the New World tropics and cultivated as an ornamental plant and for its sweet-smelling, edible fruit. The cassabanana vine is fleshy and tall, with many tendrils. Both male and female flowers are yellow and borne on the same plant, but the male flowers are smaller. The oblong or cylindrical orange-red fruit may be 60 cm (about 24 inches) long. In temperate areas the cassabanana can be cultivated as an annual plant but may not bear flowers or fruit.

Cassander (b. c. 358 BC—d. 297 BC), son of the Macedonian regent Antipater and king of Macedonia from 305 to 297.

Cassander was one of the *diadochoi* ("successors"), the Macedonian generals who fought over the empire of Alexander the Great after his death in 323. After Antipater's death in 319, Cassander refused to acknowledge the new regent, Polyperchon. With the aid of Antigonos I Monophthalmus, ruler of Phrygia, Cassander seized Macedonia and most of Greece, including Athens (319–317). When Antigonos returned from the eastern provinces intending to reunite Alexander's empire under his own sovereignty, Cassander joined forces with Ptolemy I, Seleucus, and Lysimachus (rulers of Egypt, Babylon, and Thrace, respectively) to oppose him. Between 315 and 303 the two sides clashed frequently. Cassander lost Athens in 307 and his other possessions south of Thessaly in 303–302, but the defeat of Antigonos at the Battle of Ipsus in Phrygia (301) secured Cassander's control of Macedonia.

Even though he had already murdered Alexander IV and Roxana, the son and the widow of Alexander the Great, Cassander did not take the royal title until 305. His ruthlessness toward Alexander's family was partly dictated by political considerations, but his personal hatred for the dead king was evidenced by his rebuilding of Thebes, which had been leveled by Alexander as punishment for the Theban rebellion.

Cassandra, in Greek mythology, the daughter of Priam, the last king of Troy, and his wife Hecuba. Cassandra was loved by the god Apollo, who promised her the power of prophecy if she would comply with his desires. Cassandra accepted the proposal, received the

gift, and then refused the god her favours. Apollo revenged himself by ordaining that her prophecies should never be believed. She accurately predicted such events as the fall of Troy and the death of Agamemnon, but her warnings went unheeded. In the distribution of the spoils after the capture of Troy, Cassandra fell to Agamemnon and was later murdered with him. She was worshiped, as Alexandra, with Apollo. See also Agamemnon.

cassandra (shrub): see leatherleaf.

Cassandre, pseudonym of ADOLPHE-JEAN-MARIE MOURON (b. Jan. 24, 1901, Kharkov, Ukraine, Russian Empire [now Kharkiv, Ukraine]—d. June 19, 1968, Paris, France), graphic artist, stage designer, and painter whose poster designs greatly influenced advertising art in the first half of the 20th century.

After studying art at the Académie Julian in Paris, Cassandre gained a reputation with such posters as "Étoile du Nord" (1927) and "Dubo Dubon Dubonnet" (1932). The Dubonnet posters were among the earliest designed specifically to be seen from fast-moving vehicles, and they introduced the idea of the serial poster, a group of posters to be seen in rapid succession to convey a complete idea.

In 1926 Cassandre cofounded the advertising agency Alliance Graphique and soon turned his attention to experimental typography. In 1929 he designed Bifur, a new typeface. Later, he designed two other typefaces, Acier Noir (1935) and Piegnot (1937). In 1939 he abandoned poster art and henceforth devoted himself to designing stage sets and to painting.

cassation, in music, 18th-century genre for orchestra or small ensemble that was written in several short movements. It was akin to the 18th-century serenade and divertimento and, like these, was often intended for performance outdoors. Among suggested origins of the term are the Italian *cassa*, "drum" (Mozart's cassations K. 63 and 99 open with march movements), and the Austrian dialectal *gassatin gehen*, "to go into the street."

Cassation, Cour de (French judiciary): see Cour de Cassation.

Cassatt, Mary (b. May 22, 1844, Allegheny City, Pa., U.S.—d. June 14, 1926, Château de Beaufresne, near Paris, France), American

"Women Admiring a Child," pastel by Mary Cassatt, 1897; in the Detroit Institute of Arts

© The Detroit Institute of Arts, gift of Edward Candler Walker

painter and printmaker who exhibited with the Impressionists.

Much of Cassatt's early life was spent in Europe with her wealthy family. She attended the Pennsylvania Academy of the Fine Arts (1861–65) and worked briefly with Charles Joshua Chaplin in Paris, but she preferred working in her own way and copying old masters.

Although she was never actually a pupil of Edgar Degas, he was a close friend, and Cassatt was much influenced by him. He admired her entry in the Salon of 1874, and at his invitation she joined the Impressionists and afterward showed her works at their exhibitions.

Degas's influence is apparent in Cassatt's mastery of drawing and in her unposed, asymmetrical compositions. Like him, she was innovative and inventive in exploiting the medium of pastels, in which she executed some of her best works.

Initially, Cassatt was a figure painter whose subjects were groups of women drinking tea or on outings with friends. After the great exhibition of Japanese prints held in Paris in 1890, she brought out her series of 10 coloured prints; e.g., "Woman Bathing" and "The Coiffure," in which the influence of the Japanese masters Utamaro and Toyokuni is apparent. In these etchings, combining aquatint, dry point, and soft ground, she brought her printmaking technique to perfection. Her emphasis shifted from form to line and pattern. Soon after 1900 her eyesight began to fail, and by 1914 she had ceased working. The principal motif of her mature and perhaps most familiar period is mothers caring for small children; e.g., "The Bath" ("La Toilette," c. 1892; Art Institute of Chicago).

Cassatt urged her wealthy American friends and relatives to buy Impressionist paintings, and in this way, more than through her own works, she exerted a lasting influence on American taste. She was largely responsible for selecting the works that make up the H.O. Havemeyer Collection in the Metropolitan Museum of Art, New York City.

cassava, also called MANIOC, MANDIOC, or YUCA (*Manihot esculenta*), tuberous edible plant of the spurge family (Euphorbiaceae) from the American tropics. It is cultivated throughout the tropical world for its tuberous roots, from which cassava flour, breads, tapioca, a laundry starch, and even an alcoholic beverage are derived. Cassava probably was first cultivated by the Maya in Yucatán.

A cyanide-producing sugar derivative occurs in varying amounts in most varieties. Primitive peoples developed a complex refining system to remove the poison by grating, pressing, and heating the tubers. The poison (hydrocyanic acid) has been used for darts and arrows.

An extremely variable species, cassava probably is a hybrid. It is a perennial with conspicuous, almost palmate (fan-shaped) leaves resembling those of the castor bean but more deeply parted into five to nine lobes. The fleshy roots are reminiscent of dahlia tubers. Different varieties range from low herbs through many-branched, 1-metre- (3-foot)-tall shrubs to slender, unbranched 5-m trees. Some are adapted to dry areas of alkaline soil and others to acid mudbanks along rivers.

All the approximately 160 species of the genus *Manihot* are sun-loving natives of tropical America. Ceará rubber is produced from *M. glaziovii*, from northeastern Brazil. Food items such as the gelatinous fufu of West Africa and the bami mush of Jamaica come from cassava. Additional cassava products include an alcoholic beverage made by Indians in South America, the powdery casabe cakes of Yucatán, and tapioca, the only cassava product on northern markets.

Casse, Pierre-Emmanuel-Albert, Baron Du: see Du Casse, Pierre-Emmanuel-Albert, Baron.

Cassegrain reflector, in astronomical telescopes, an arrangement of mirrors to focus incoming light at a point close to the main light-gathering mirror. The design was proposed in 1672 by N. Cassegrain, a French scientist of whom virtually nothing else is known.

In the Cassegrain reflector, parallel rays of light entering the telescope are reflected from a large concave mirror toward the focal point of that mirror, which is called the prime focus of the telescope. Before reaching the prime focus, the light rays are reflected again by a

small convex mirror that brings them to a focus near a small hole in the centre of the main mirror.

The value of the Cassegrain reflector was not fully appreciated until a century later, when the English optician Jesse Ramsden found that this design reduces blurring of the image caused by the sphericity of the lenses or mirrors. This blurring (spherical aberration) may be entirely corrected by making the large, concave mirror paraboloidal and the small, convex mirror hyperboloidal. The Cassegrain reflector has been employed in radio transmitters and receivers.

Cassel (Germany): see Kassel.

Cassel, (Karl) Gustav (b. Oct. 20, 1866, Stockholm—d. Jan. 14, 1945, Djursholm?, Swed.), Swedish economist who gained international prominence through his work on world monetary problems at the Brussels Conference in 1920 and on the League of Nations Finance Committee in 1921.

Cassel, portrait by Arne Cassel, 1940; in the Nationalmuseum, Stockholm
By courtesy of the Svenska Portrattarkivet, Stockholm

Cassel was educated at the universities of Uppsala and Stockholm and became professor of economics at the latter (1904–33). In his theoretical studies, he rejected the marginal utility value theory of English and Austrian economists.

He served as Swedish delegate to several meetings of the International Chamber of Commerce and in 1933 was sent by the Swedish government to the World Economic Conference in London.

Cassel porcelain, Cassel also spelled KASSEL, porcelain produced by a factory at Cassel, Hesse, under the patronage of the Landgrave of Hesse. The factory fired hard-paste porcelain in 1766, though complete tea or coffee services were not produced until 1769. Most surviving examples are painted in underglaze

Cassel porcelain saltcellar in the form of a kneeling figure, c. 1775; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London, photograph, EB Inc

blue. The factory is particularly noted for modelled classical groups, animal groups, the seasons, and similar figure work. It closed in 1788.

Casselian Stage: see Chattian Stage.

Cassella Farbewerke Mainkur Aktiengesellschaft (German: Cassella Dyeworks Mainkur Limited-liability Company), German chemical corporation founded in 1789 by Leopold Cassella (1766–1847) in Frankfurt and today a subsidiary of Hoechst Aktiengesellschaft (q.v.).

From 1789 to 1870 the company dealt only in the import and selling of coloured woods and natural dyestuffs; in the latter year it took up the manufacture of dyestuffs. Although the company underwent a series of name changes, it was known as Leopold Cassella & Co. when, in 1904, it merged with Farbewerke Hoeschst (Hoechst Dyeworks). In 1925, when Hoechst joined the new chemical cartel, IG Farben (q.v.), Cassella reasserted its independence and was not absorbed by the cartel until 1937. After World War II, in the dissolution of IG Farben, Cassella again became independent (under its current name)—but only briefly, for by 1970 Hoechst AG had purchased a controlling interest in Cassella.

Cassella products include dyes; auxiliary materials for the textile, paper, and leather industries; raw materials for paints; synthetic resins for laminated plastic sheeting; and pharmaceuticals.

Casserius, Julius, Italian GIULIO CASSERIO (b. 1552?, Piacenza, Italy—d. 1616, Padua), anatomist who gave the first detailed descriptions of the organs of speech and hearing. His texts are notable for their descriptive accuracy and detailed investigation into human and comparative anatomy.

Casserius, detail of an engraving
Alinari—Art Resource/EB Inc

Casserius was a servant of Hieronymus Fabricius ab Aquapendente, professor of anatomy and surgery at the University of Padua. Instructed in anatomical dissection by Fabricius and by Hieronymus Mercurialis, he gained such skill that he became the substitute for Fabricius in anatomical instruction in 1604 and after 1609 held the chair of surgery. He was one of William Harvey's instructors.

Casserius' anatomical works include *De vocis auditusque organis historia anatomica* (1601; "Anatomical Treatise on the Organs of Speech and Hearing") and *Tabulae anatomicae* ("Anatomical Tables"), published posthumously in 1627.

cassette, also called TAPE CASSETTE, in audio and video recording, flat, rectangular container made of plastic or lightweight metal that holds magnetic tape for audio or video record-

ing and replay. A tape cassette is designed so that it can be inserted in a recorder and used immediately; it eliminates the need to thread a portion of the tape manually before starting the recorder. In a cassette the tape begins on a feed reel at one side and moves along guides through the record-playback mechanism, after which it passes on to the take-up reel on the opposite side.

Audiocassette tape is only 0.15 inch (3.8 millimetres) wide but can carry four to eight tracks. Videocassette tape used in home video recorders is 1/2 inch (12.7 millimetres) wide; the type employed by television broadcasters measures 2 inches (5 centimetres) in width.

Audiocassettes, which were introduced for home use in the 1960s, may be provided with prerecorded materials or with blank tape so that users can record whatever they wish. Videocassettes, which became available to consumers in the early 1970s, may also contain prerecorded materials, such as reproductions of popular motion pictures, or blank tape for recording television programs and for producing home movies. A lightproof magazine for photographic film or plates is also styled a cassette.

cassia, also called **CHINESE CINNAMON**, spice consisting of the aromatic bark of the *Cinnamomum cassia* plant of the family Lauraceae. Similar to true cinnamon, cassia bark has a more pungent, less delicate flavour and is thicker than cinnamon bark. It contains from 1 to 2 percent oil of cassia, a volatile oil, the principal component of which is cinnamic aldehyde. Cassia bark is used as a flavouring in cooking and particularly in liqueurs and chocolate. Southern Europeans prefer it to cinnamon, but, in North America, ground cinnamon is sold without distinction as to the species from which the bark is obtained.

Cassia bark is peeled from stems and branches and set aside to dry. Some varieties are scraped. While drying, the bark curls into quills. The colour varies from light reddish brown for the thin, scraped bark to gray for the thick, unscraped bark. Ground cassia is reddish brown in colour. Cassia from China is less aromatic than that from Vietnam and Indonesia. Cassia from all three countries has a sweet, aromatic, and pungent flavour. Vietnamese, or Saigon, cassia is particularly highly esteemed.

Cassia buds, the dried, unripe fruits of *Cinnamomum cassia* and *Cinnamomum loureirii*, have a cinnamon-like aroma and a warm, sweet, pungent taste akin to that of cassia bark. The whole buds are added to foods for flavouring. The brown, immature fruit is snugly held in a cuplike, hard, wrinkled, grayish-brown calyx (the whole commonly called a bud) varying in size but ordinarily 0.4 inch (11 millimetres) long, including the calyx tube; the upper part of the bud may be about 0.25 in. in diameter.

Confusion sometimes arises with another group of plants because *Cassia* is the generic name of an extensive genus of leguminous plants, which, in addition to various other medicinal products, is the source of senna (*q.v.*) leaves.

Cassian, Saint John, Latin JOHANNES CASSIANUS, also called JOHANNES EREMITA, or JOHANNES MASSILIENSIS (b. 360, the Dobruja, Scythia—d. 435, Marseille; Eastern feast day February 29; feast day in Marseille July 23), ascetic, monk, theologian, and founder and first abbot of the famous abbey of Saint-Victor at Marseille. His writings, which have influenced all Western monasticism, themselves reflect much of the teaching of the hermits of Egypt, the Desert Fathers. Cassian's theology stemmed from, and was subordinate to, his concept of monasticism. He became a leading

exponent, in its early phase, of Semi-Pelagianism (*q.v.*), a heresy that flourished in southern France during the 5th century.

Probably of Roman birth, Cassian became a monk at Bethlehem and later visited and was trained by the hermits and monks of Egypt. About 399 he went to Constantinople, where he was ordained deacon by the patriarch, St. John Chrysostom. A few years later, after John had been illegally deposed, Cassian went to Rome to plead John's cause with the Pope and while there was ordained priest (405). Nothing is then known of his life until 415, when he founded a nunnery at Marseille, and also the abbey of Saint-Victor, of which he remained abbot until his death.

Cassian's most influential work is his *Institutes of the Monastic Life* (420–429); this, and his *Collations of the Fathers* (or *Conferences of the Egyptian Monks*), written as dialogues of the Desert Fathers, were influential in the further development of Western monasticism. His theological dissertation *On the Incarnation of the Lord*, written against the heretic Nestorius at the request of Pope Leo I, is an inferior work.

Cassidy, Butch, byname of ROBERT LEROY PARKER (b. April 13, 1866, Beaver, Utah, U.S.—d. 1909?, Concordia Tin Mines, near San Vicente, Bolivia?), American outlaw and foremost member of the Wild Bunch (*q.v.*), a collection of bank and train robbers who ranged through the western United States in the 1880s and '90s.

Robert Parker took his alias from Mike Cassidy, an older outlaw from whom he learned cattle rustling and gunslinging (1884–87). Thereafter—except for two years of chiefly cowboying (1891–92) and two years (1894–96) in Wyoming State Prison—he was teamed up with a succession of outlaws. His favourite friend and confederate was Elzy Lay, with whom, alone or in a gang, he helped rob a number of trains, banks, and paymasters and rustled horses and, less often, cattle. The year after Elzy was arrested and imprisoned (1899), Cassidy teamed up with Harry Longabaugh, the Sundance Kid. By then, sheriff posses and Pinkerton detectives were capturing or closing in on members of the Wild Bunch, and Cassidy and Sundance (with Sundance's girlfriend, Etta Place) escaped first to New York City and then to South America (1901). (Etta Place returned home in 1907.) From 1902 to 1906 they owned and ran a ranch in Chubut province, Argentina, but thereafter they returned to outlawry. Drifting from country to country, they robbed banks, trains, and mine stations until 1909, when, according to Pinkerton agents, they were trapped by a group of mounted soldiers near San Vicente, Bolivia, where Sundance was mortally shot and Cassidy shot himself. Another story puts their death in Mercedes, Uruguay, in December 1911, cut down by soldiers during a bank robbery. Still other stories have Cassidy (either alone or with Sundance) returning to the United States, drifting about from Mexico to Alaska, and dying in obscurity in 1937 in the Northwest or in Nevada (possibly Spokane, Wash., or Johnny, Nev.).

Cassin, René (-Samuel) (b. Oct. 5, 1887, Bayonne, Fr.—d. Feb. 20, 1976, Paris), French jurist, president of the European Court of Human Rights, and principal author of the UN Declaration of the Rights of Man; he won the 1968 Nobel Prize for Peace.

The son of a Jewish merchant, Cassin studied law before entering the French Army in World War I. During the war he sustained a severe abdominal wound, the effects of which troubled him for the rest of his life. He later became a professor of international law in Paris and then, from 1924 to 1938, served as a French delegate to the League of Nations assemblies and disarmament conferences in Geneva. After the fall of France in June 1940,

he joined Gen. Charles de Gaulle in London and served as a key member of the Free French government in exile.

After World War II Cassin became president of the Council of State (Conseil d'État), France's highest administrative court, and held other high legal and administrative offices in France. Internationally, he helped found the United Nations Educational, Scientific and Cultural Organization (UNESCO) in 1944 and was a French delegate to UNESCO from 1945 to 1952. A French representative to the United Nations from 1946 to 1968, he was president of the UN Commission on the Rights of Man (1947–48) and helped to draft the Declaration of the Rights of Man. From 1965 to 1968 he was president of the European Court of Human Rights. Cassin received the Nobel Prize for Peace on Dec. 20, 1968, the 20th anniversary of the ratification of the UN Declaration. He was also a Zionist and campaigner for Jewish rights and was president of the Alliance Israélite in France.

Cassini, (Jacques-)Dominique, comte de (count of), also called CASSINI IV (b. June 30, 1748, Paris—d. Oct. 18, 1845, Thury, Fr.) French geodesist and astronomer, who completed his father's map of France, which was later used as the basis for the *Atlas National* (1791). The son of César-François Cassini de Thury, he succeeded him as director of the Observatoire de Paris in 1784, but the French Revolution interrupted his plans for restoring and reequipping the observatory. He briefly cooperated with the revolutionary government, but his monarchist sympathies prevailed, and he was denounced and arrested. After some months in prison he withdrew to Thury in 1794. Later, Napoleon I made him a senator and count.

Cassini, Gian Domenico (Italian), French JEAN-DOMINIQUE CASSINI (b. June 8, 1625, Perinaldo, Republic of Genoa—d. Sept. 14, 1712, Paris), Italian-born French astronomer who, among others, discovered Cassini's division, the dark gap between the rings A and B of Saturn; he also discovered four of Saturn's moons. In addition, he was the first to record observations of the zodiacal light.

Cassini's early studies were principally observations of the Sun, but after he obtained more powerful telescopes, he turned his attention to the planets. Observing the shadows of Jupiter's satellites as they passed between that planet and the Sun, he was able to measure Jupiter's rotational period. In 1666, after similar observations of Mars, he found the value of 24 hours 40 minutes for Mars's rotational period; it is now given as 24 hours 37 minutes 22.6 seconds. Two years later he compiled a table of the positions of Jupiter's satellites that was used in 1675 by the Danish astronomer Ole Rømer to establish that the speed of light is finite. In addition, he wrote several memoirs on flood control, and he experimented extensively in applied hydraulics.

Hearing of Cassini's discoveries and work, King Louis XIV of France invited him to Paris in 1669 to join the recently formed Académie Royale des Sciences. Cassini assumed the directorship of the Observatoire de Paris after it was completed in 1671, and two years later he became a French citizen.

Continuing the studies begun in Italy, Cassini discovered the Saturnian satellites Iapetus (1671), Rhea (1672), Tethys (1684), and Dione (1684). Between 1671 and 1679 he made observations of the Moon, compiling a large map, which he presented to the Académie. In 1675 he discovered Cassini's division and expressed the opinion that Saturn's rings were swarms of tiny moonlets too small to be seen individually, an opinion that has been substantiated. In 1683, after a careful study of the zodiacal light, he concluded that it was of cosmic origin and not a meteorological phenomenon, as some proposed.

In 1683 Cassini began the measurement of the arc of the meridian (longitude line) through Paris. From the results, he concluded that the Earth is somewhat elongated (it is actually somewhat flattened at the poles). A traditionalist, he accepted the solar theory of Nicolaus Copernicus within limits, but he rejected the theory of Johannes Kepler that planets travel in ellipses and proposed that their paths were certain curved ovals, which came to be known as Cassinians, or ovals of Cassini. Although Cassini resisted new theories and ideas, his discoveries and observations unquestionably place him among the most important astronomers of the 17th and 18th centuries.

Cassini, Jacques (b. Feb. 8, 1677, Paris, France—d. April 18, 1756, Thury), French astronomer who compiled the first tables of the orbital motions of Saturn's satellites.

He succeeded his father, the astronomer Gian Domenico Cassini, as head of the Paris Observatory in 1712, and in 1718 he completed the measurement of the arc of the meridian (longitude line) between Dunkerque and Perpignan. In his *De la grandeur et de la figure de la terre* (1720; "Concerning the Size and Shape of the Earth"), he supported the theory that the Earth is an elongated sphere, rather than flattened.

Cassini's astronomical studies are found principally in *Éléments d'astronomie* (1740; "Elements of Astronomy") and *Tables astronomiques du soleil, de la lune, des planètes, des étoiles fixes et des satellites de Jupiter et de Saturne* (1740; "Astronomical Tables of the Sun, Moon, Planets, Fixed Stars, and Satellites of Jupiter and Saturn"). An ardent opponent of Sir Isaac Newton's gravitational theory, he continually defended his father's work; but he was unable to reconcile his observations with his father's theories.

Cassini de Thury, César-François, also called CASSINI III (b. June 17, 1714, Thury, France—d. Sept. 4, 1784, Paris), French astronomer and geodesist, who continued surveying work undertaken by his father, Jacques Cassini, and began construction of a great topographical map of France.

Although he, his father, and his grandfather had defended the Cartesian view that the Earth is somewhat elongated (with a polar diameter greater than the equatorial diameter), Cassini III abandoned that position in the face of growing evidence that favoured the opposite, so-called Newtonian view that the Earth is flattened at the poles. He succeeded his father as director of the Paris Observatory in 1771, but his achievements as an astronomer were less distinguished than those as a geodesist and cartographer. From the 1740s until his death, Cassini de Thury directed work on a general topographic map of France. Published in 1789, this *Carte géométrique de la France* ("Geometric Map of France"), or *Carte de Cassini*, was the first map of an entire country drawn up on the basis of extensive triangulation and topographic surveys. Another of his works is *Description géométrique de la Terre* (1775; "Geometric Description of the Earth").

Cassini's laws, three empirical rules that accurately describe the rotation of the Moon, formulated in 1693 by Gian Domenico Cassini. They are: (1) the Moon rotates uniformly about its own axis once in the same time that it takes to revolve around the Earth; (2) the Moon's equator is tilted at a constant angle (about $1^{\circ}32'$ of arc) to the ecliptic, the plane of Earth's orbit around the Sun; and (3) the ascending node of the lunar orbit (*i.e.*, the point where the lunar orbit passes from south to north on the ecliptic) always coincides with the descending node of the lunar equator (*i.e.*, the point where the lunar equator passes from north to south on the ecliptic). As a consequence of the third law, the north pole of the

Planes of the ecliptic, the lunar equator, and the lunar orbit

Moon as projected on the sky (point Z), the north pole of the ecliptic (point Z), and the north pole of the lunar orbit (point P, inclined at an angle of about $5^{\circ}9'$ to the ecliptic) all lie close to one another on a great circle.

Cassino, Latin CASINUM, town, Frosinone provincia, Lazio (Latium) regione, central Italy. Cassino lies along the Rapido River at the foot of Monte (mount) Cassino, 87 miles (140 km) southeast of Rome. It originated as Casinum, a town of the ancient Volsci people on a site adjacent to the modern town, on the lower slopes of the mountain. Casinum passed under Roman control in 312 BC and thereafter prospered. It became a bishopric in the 5th century AD but suffered badly from successive barbarian incursions. In 529 St. Benedict of Nursia established the nucleus of his famous monastery on the summit of Monte Cassino. A remnant of the city below lingered on until it was abandoned by the remaining inhabitants about 866 for the present site, originally called Eulogomenopolis, later San Germano, and since 1871 Cassino. The settlement was strengthened in the 9th century by the building of the Rocca Ianula (fortress), where in 1139 Pope Innocent II was besieged and captured by Roger II of Sicily, and where in 1230 Pope Gregory IX made peace with the Holy Roman emperor Frederick II. It was sacked by French troops in 1799.

The Benedictine monastery, stormed by the Lombards in 589, the Saracens in 884, and the Normans in 1030 and temporarily deserted, was each time refounded on the original site. The parent house of Western monasticism, it was during the Middle Ages an outstanding centre of the arts and of learning. Paul the Deacon (c. 720–799) wrote his history of the Lombards there, founding a long tradition of historical scholarship; and the radical reconstruction of the abbey in the 11th century by the abbot Desiderius (later Pope Victor III) was a major event in the history of Italian architecture. In 1349 the buildings suffered from a severe earthquake, and the church and monastery were almost entirely rebuilt in the 16th and 17th centuries.

During World War II (1944) Cassino was a key point in the German winter defensive line (Garigliano-Sangro) blocking the Allied advance to Rome. At the beginning of January 1944 the U.S. 5th Army won a position facing

The restored Benedictine monastery on Monte Cassino, Italy
Rotafoto

Cassino across the Garigliano River. Heroic fighting by Allied troops met heroic German resistance in three savage battles. On February 15 the Allies bombed and demolished the Benedictine monastery, erroneously believing that the Germans had occupied and fortified it. Actually, the Germans were able to remove both the monks and the treasures of the abbey; and, after the bombardment ceased, they in fact occupied and fortified the ruins. A month later Allied aircraft dropped 1,400 tons of bombs on Cassino, leaving the town so heaped with rubble that tanks could not operate until bulldozers cleared paths for them. Finally in mid-May the Allies did break through German lines and, joined a few days later by forces bursting out of the Anzio beachhead, were able to take Rome. German and Allied war cemeteries, still visited by thousands annually, mark the scenes of the fighting.

After the war, both the town and the abbey were rebuilt on their previous sites, the town on a completely new plan, the abbey following substantially the lines of its predecessor. Little or nothing of the abbey's decorative detail was recoverable, but the famous bronze doors, cast in Constantinople for the abbot Desiderius in 1066, were found and restored. The archives, library, and some paintings were saved. Of ancient Casinum the only monuments of note are the amphitheatre, the theatre, and the ruins of the Cappella del Crocifisso, a Roman mausoleum converted into a church in the 10th century. Of the medieval town little more than the site of the upper town, clustered around the ruins of Rocca Ianula, can be discerned.

An agricultural and commercial centre, Cassino manufactures toys. Pop. (1993 est.) mun., 32,870.

Cassiodorus, in full FLAVIUS MAGNUS AURELIUS CASSIODORUS (b. c. AD 490, Scylletium, Bruttium, kingdom of the Ostrogoths [now Squillace, Italy]—d. c. 585, Vivarium Monastery, near Scylletium), historian, statesman, and monk who helped to save the culture of Rome at a time of impending barbarism.

During the period of the Ostrogothic kings in Italy, Cassiodorus was quaestor (507–511), consul in 514, and, at the death of Theodoric in 526, *magister officiorum* ("chief of the civil service"). Under Athalaric he became praetorian prefect in 533. Not long after 540 he retired and founded a monastery named Vivarium, to perpetuate the culture of Rome. Cassiodorus was neither a great writer nor a great scholar, but his importance in the history of Western culture can hardly be overestimated. He collected manuscripts and enjoined his monks to copy the works of pagan as well as Christian authors; to this is due the preservation of many ancient authors' writings, for his monastery set an example that was followed elsewhere in later centuries.

His works fall into two groups: (1) historical and political and (2) theological and grammatical. In the first category are the *Variae*, 12 books published in or not much later than 537, which contain, as models of style, 468 official letters and documents that Cassiodorus composed in the names of Theodoric, Athalaric, Theodat, and Vitiges, as well as the edicts he issued as praetorian prefect; and the *Chronicon* (519), a history of mankind from Adam to 519. Among the second grouping of his works are *De anima*, which is mainly concerned with the nature of the soul and life after death, and the *Institutiones divinarum et saecularium litterarum*, which is perhaps the most important of his works. Written for his monks, the first part discusses the study of scripture and touches on the Christian fathers and historians. The second part,

widely used in the Middle Ages, gives a brief exposition of the seven liberal arts, a kind of encyclopaedia of pagan learning regarded as indispensable for understanding the Bible. The *De orthographia*, a compilation made by Cassiodorus in his 93rd year from the works of eight grammarians, is valuable because it contains extracts from works now lost. His *De artibus ac disciplinis liberalium litterarum* contains one of the principal sources of early medieval music theory, *Institutiones musicae*.

Cassiopea, genus of marine jellyfish constituting the order Rhizostomeae (class Scyphozoa, phylum Cnidaria) and found in tropical waters. Members of the genus measure more than 100 mm (4 inches) in diameter. They are flattish, with four to six flat, short-sided branches projecting from both sides of the mouth, or oral, arms. Each of these tentacles supports several pouches that contain symbiotic algae (zooxanthellae); such symbionts also occur over the disk of the medusa, which is the bell-shaped body of the animal. The algae are varied in colour and so give rise to medusae of many different colour varieties. The medusa of the *Cassiopea* is thought to gain nutrients from the photosynthesizing algae. Accordingly, it lies inverted in shallow water, exposing the maximum number of algae to sunlight. It swims infrequently. *Cassiopea* has a sessile (attached) stage typical of scyphozoan jellyfish: it grows from a polyp and, upon reaching a certain size, is released as a free-swimming form. The genus is harmless to humans.

Cassiopeia, abbreviated CAS, in astronomy, a constellation of the northern sky, easily recognized by a group of five bright stars forming a slightly irregular W. It lies at one hour right ascension (the coordinate of the celestial sphere analogous to longitude on the Earth) and 60° north declination (angular distance north of the celestial equator). Tycho's nova, one of the few recorded supernovae in the Galaxy, appeared in Cassiopeia in 1572.

Cassiquiare River: see Casiquiare.

Cassirer, Ernst (b. July 28, 1874, Breslau, Silesia, Ger. [now Wrocław, Poland]—d. April 13, 1945, New York, N.Y., U.S.), German-Jewish philosopher, educator, and prolific writer, remembered for his interpretation and analysis of cultural values.

Educated in German universities, Cassirer was strongly influenced at the University of Marburg by Hermann Cohen, founder of the Marburg school of Neo-Kantianism. Cassirer taught in Berlin, worked as a civil servant during World War I, and in 1919 became professor of philosophy at the University of Hamburg, where he was rector from 1930. When Adolf Hitler came to power, he left Germany and taught at the universities of Oxford (1933–35) and of Göteborg, Sweden (1935–

41), and at Yale (1941–44) and Columbia (1944–45) universities in the United States.

Cassirer's philosophy, based primarily on the work of Immanuel Kant, extends that philosopher's basic principles concerning the ways in which humans use concepts to structure their impressions of the natural world. Because scientific and cultural views had changed considerably since Kant's day, Cassirer felt it necessary to revise Kantian doctrines to include a wider range of human experience. In his major work, *Die Philosophie der symbolischen Formen*, 3 vol. (1923–29; *The Philosophy of Symbolic Forms*), he examined the mental images and the functions of the mind that underlie every manifestation of human culture. In another significant work, *Substanzbegriff und Funktionsbegriff* (1910; *Substance and Function*), he treated the related topic of concept formation. Attacking the view that a concept is formed by abstracting from a number of particular instances, he argued that the concept, as an instrument in organizing human knowledge, is already pre-existent before any task involving the classification of particulars can even be performed. After examining the various forms of man's cultural expression, he concluded that man is essentially characterized by his unique ability to use the "symbolic forms" of myth, language, and science as a means of structuring his experiences and thereby understanding both himself and the world of nature. Among Cassirer's other writings are *Sprache und Mythos* (1925; *Language and Myth*), *Die Philosophie der Aufklärung* (1932; *The Philosophy of the Enlightenment*), *An Essay on Man* (1944), and *The Myth of the State* (1946).

BIBLIOGRAPHY. Cassirer's life and work are studied in Seymour W. Itzkoff, *Ernst Cassirer* (1977); David R. Lipton, *Ernst Cassirer* (1978); Paul Arthur Schilpp, *The Philosophy of Ernst Cassirer* (1949, reissued 1973); and John Michael Krois, *Cassirer: Symbolic Forms and History* (1987).

cassiterite, also called **TINSTONE**, heavy, metallic, hard tin dioxide (SnO₂) that is the major ore of tin. It is colourless when pure, but brown or black when iron impurities are

Cassiterite from Araca, Bolivia
B.M. Shaub

present. Commercially important quantities occur in placer deposits, but cassiterite also occurs in granite and pegmatites. Early in the 15th century, the cassiterite veins in Saxony and Bohemia were mined for tin; peak production occurred there in the 17th century. In the 18th and much of the 19th centuries, the very large vein deposits of Cornwall were the major source of tin. Today most of the world's cassiterite is mined in Malaysia, Indonesia, Bolivia, Nigeria, Myanmar (Burma), Thailand, and parts of China; other countries produce smaller amounts. For detailed physical properties, see oxide mineral (table).

Cassius, Gaius, byname **PARMENSIS** (Latin: "of Parma") (b. Parma [Italy]—d. after 31 bc), one of the assassins of Julius Caesar. After the death of Caesar he joined the party of Marcus Junius Brutus and Gaius Cassius Longinus

(the more famous Cassius and prime mover of the assassination).

After Caesar's assassination, Cassius was in command of the fleet that engaged Publius Cornelius Dolabella off the coast of Asia, but after the Battle of Philippi he joined Sextus Pompeius in Sicily. When Sextus Pompeius was defeated at Naulochus by Agrippa and fled to Asia, Cassius went over to Mark Antony and was present at the Battle of Actium (31), where Antony was defeated by Octavian (the future emperor Augustus). Cassius afterward fled to Athens, where he was put to death by Octavian.

Cassius is credited with satires, elegies, epigrams, and tragedies; and Horace, to judge from a remark in the *Epistles*, thought well of his poetry. Nothing of his work survives: the hexameters with the title *Cassii Orpheus* are the work of a 16th-century humanist. The story that Lucius Varius Rufus took his tragedy *Thyestes* from a manuscript found among the papers of Cassius is due to a confusion.

Cassius, Gaius Avidius: see Avidius Cassius, Gaius.

Cassius Longinus, Gaius (d. 42 bc, near Philippi, Macedonia [now in Greece]), prime mover in the conspiracy to assassinate Julius Caesar in 44 bc.

Little is known of his early life. As a quaestor in 53 bc, Cassius served under Marcus Licinius Crassus and saved the remnants of the Roman army defeated by the Parthians at Carrae (modern Harran, Turkey). For the next two years he successfully repelled the Parthian attacks on Syria. Cassius became tribune in 49, and the outbreak of the civil war between Caesar and the Optimates in that year saved him from being brought to trial for extortion in Syria. In that war he at first commanded part of the fleet of Caesar's opponent, Pompey the Great. After Pompey was decisively defeated by Caesar at Pharsalus in Thessaly (48), Cassius was reconciled to Caesar, who made him one of his legates.

In 44 Cassius became *praetor peregrinus* and was promised the governorship of Syria for the following year. The appointment of his junior, Marcus Junius Brutus, as *praetor urbanus* deeply offended him, and he became one of the busiest conspirators against Caesar, taking a very active part in the assassination. Forced by popular resentment to withdraw from Rome after the murder, he left Italy for Syria, where he raised a large army and defeated Publius Cornelius Dolabella, to whom the province had been assigned by the Senate. When in 43 the Caesarian leaders Mark Antony, Octavian (later the emperor Augustus), and Marcus Aemilius Lepidus formed the Second Triumvirate, Cassius and his fellow conspirator, Brutus, combined their armies, crossed the Hellespont, marched through Thrace, and encamped near Philippi in Macedonia. Their intention was to starve out the enemy, but they were forced into an engagement. Brutus was successful against Octavian, but Cassius, defeated by Mark Antony, gave up all for lost and ordered his freedman to slay him. He was lamented by Brutus as "the last of the Romans" and buried at Thasos. (He had married Brutus' half-sister Junia Tertia, who lived until AD 22.)

Cassius was a man of considerable ability and a good soldier, but in politics he was actuated by vanity and ambition and had an uncontrollable temper and sharp tongue. His portrait in William Shakespeare's *Julius Caesar*, though vivid, is scarcely historical.

Cassius Longinus, Gaius (fl. 1st century AD), prominent Roman jurist, a pupil of the famous jurist Massurius Sabinus, with whom he founded a legal school.

Cassius was consul in AD 30, proconsul of Asia in 40–41, and governor of Syria in 45–49.

Cassirer

By courtesy of Yale University Archives, Yale University Library

Banished by the emperor Nero in 65, he was recalled by the emperor Vespasian (reigned 69–79) and died at an advanced age. Extracts from his chief work, the *Libri juris civilis*, in 10 books, were incorporated into the Digest issued by the 6th-century Byzantine emperor Justinian I.

Cassius Vecellinus, Spurius (fl. late 6th and early 5th centuries BC), Roman consul who, by bringing peace to the area around Rome, contributed to the growth of the city in an early phase of its development.

A patrician, Cassius is said to have held the consulate three times. During his first term (502 BC) he defeated the Sabines, a people who lived northeast of Rome. During his second consulate (493) he concluded with the Latins the mutual defense treaty that lasted until about 380 and remained the basis of Latin status. Some sources—of questionable authority—maintain that during a third consulate (486) Cassius proposed an agrarian law to assist needy plebeians, a measure violently opposed both by the patricians and by the wealthy plebeians, who, according to the same sources, had Cassius condemned and executed.

Cassivellaunus, also spelled CASSIVELAUNUS (fl. 1st century BC), powerful British chieftain who was defeated by Julius Caesar during his second raiding expedition into Britain (54 BC).

Cassivellaunus led his tribe, the Catuvellauni (a Belgic people who lived in modern Hertfordshire), against the Roman invaders, making effective use of guerrilla tactics and chariot warfare. Finally Caesar captured the principal fortified settlement, since identified as a site in present-day Wheathampstead, Hertfordshire. The British leader was granted peace when he agreed to provide hostages and pay an annual tribute to Rome. These promises, however, were probably not meant to be kept, and it appears certain that the tribute was never paid.

cassock, long garment worn by Roman Catholic and other clergy both as ordinary

archbishops and bishops black with red trim, and lesser clergy plain black. In choir and church ceremonies the pope wears a white silk cassock; cardinals wear scarlet, except in penitential seasons when they wear purple; and lesser clergy wear plain black.

The cassock, though part of the canonical costume of the clergy, is not a liturgical vestment. It was originally the out-of-doors and domestic dress of European laity as well as clergy, and its survival among the latter when the secular fashions had changed is merely the outcome of ecclesiastical conservatism. In mild weather it was the outer garment; in cold weather it was worn under the tabard (a tunic with or without short sleeves) or chimere (a loose, sleeveless gown); sometimes in the Middle Ages the name chimere was given to it as well as to the sleeveless upper robe. In winter the cassock was often lined with furs varying in costliness with the rank of the wearer, and its colour also varied in the Middle Ages with ecclesiastical or academic status.

In the Roman Catholic church the cassock was traditionally worn by the clergy whenever they appeared, both in ordinary life (except in Protestant countries) and under their vestments in church. In the Church of England the cassock, which with the gown is prescribed by a canon of 1604 as the canonical dress of the clergy, has been worn by the clergy since the Reformation. It has long ceased, however, to be the everyday walking dress of either Catholic or Anglican clergy and is now usually worn only in church, at home, or more rarely within the precincts of their own parishes.

In the Eastern church the cassock's equivalent is called a rhason.

cassone, Italian chest, usually used as a marriage chest, and the most elaborately decorated piece of furniture of the Renaissance. Cassoni traditionally were made in pairs and sometimes bore the respective coats of arms of the bride and groom. They contained the bride's clothes, linen, and many other items of her dowry. In the 15th century, when the greatest importance was attached to suitable marital alliances between Florence's wealthiest families, the cassone reached great heights of artistic achievement. Florentine artists such as Sandro Botticelli, Paolo Uccello, and Donatello were employed to decorate cassoni with paintings set in an architectural framework. Battle scenes and classical and literary themes were especially popular. A number of paintings from cassoni of this period have been preserved.

Sixteenth-century cassoni were elaborately carved with mythological and grotesque figures, decorated with gilt gesso, putti (cupids), and swags of fruit and flowers, or enriched with intarsia (mosaics of wood). Although the finest marriage chests came from Italy, they were also used in other countries.

cassowary, any of several species of large flightless birds of the Australo-Papuan region. Cassowaries are the sole members of the family Casuariidae, order Casuariiformes, the order that also includes the emus. The cassowary has been known to kill humans with slashing blows of its feet: the innermost of its three toes bears a long, daggerlike nail. The bird moves rapidly along narrow tracks in the bush, its naked blue head protected by a bony helmet, or casque. The body is black in adults, brownish in immature birds. The female lays three to six green eggs, each of which is about 13 cm (5 inches) long and weighs 650 g (23 ounces). The male incubates these for about 50 days in a leafy nest on the ground and may also provide most of the early care of the striped young. Cassowaries forage for fruits and small animals. There are three species (counted by some experts as six), each with several races. The common, or Australian,

Common, or Australian, cassowary (*Casuarus casuarus*)

Anthony Mercieca from Root Resources

cassowary, *Casuarus casuarus*, which inhabits New Guinea, nearby islands, and Australia, is the largest—almost 1.5 m (5 feet) tall—and has two long, red wattles on the throat.

cast iron, an alloy of iron that contains 2 to 4 percent carbon, along with varying amounts

Renaissance cassone, gilded poplar with painted panel, from the Palazzo Strozzi, Florence, c. 1475; in the Metropolitan Museum of Art, New York City

Contemporary cassock

Algimantas Kezys

dress and under liturgical garments. The cassock, with button closure, has long sleeves and fits the body closely. In the Roman Catholic church the colour and trim vary with the ecclesiastical rank of the wearer: the pope wears plain white, cardinals black with scarlet trim,

of silicon and manganese and traces of impurities such as sulfur and phosphorus. It is made by reducing iron ore in a blast furnace (*q.v.*). The liquid iron is cast, or poured and hardened, into crude ingots called pigs, and the pigs are subsequently remelted along with scrap and alloying elements in cupola furnaces and recast into molds for producing a variety of products.

The Chinese produced cast iron as early as the 6th century BC, and it was produced sporadically in Europe by the 14th century. It was introduced into England about 1500; the first ironworks in America were established on the James River, Virginia, in 1619. During the 18th and 19th centuries, cast iron was a cheaper engineering material than wrought iron because it did not require intensive refining and working with hammers, but it was more brittle and inferior in tensile strength. Nevertheless, its load-bearing strength made it the first important structural metal, and it was used in some of the earliest skyscrapers. In the 20th century, steel replaced cast iron in construction, but cast iron continues to have many industrial applications.

Most cast iron is either so-called gray iron or white iron, the colours shown by fracture. Gray iron contains more silicon and is less hard and more machinable than is white iron. Both are brittle, but a malleable cast iron produced by a prolonged heat treatment was developed in France in the 18th century, and a cast iron that is ductile as cast was invented in the United States and Britain in 1948. Such ductile irons now constitute a major family of metals that are widely used for gears, dies, automobile crankshafts, and many other machine parts.

Castagno, Andrea del, pseudonym of ANDREA DI BARTOLO (b. c. 1421, San Martino a Corella, near Castagno San Godenzo, republic of Florence [now in Italy]—d. Aug. 19, 1457, Florence), one of the most influential 15th-century Italian Renaissance painters, best known for the emotional power and naturalistic treatment of figures in his work.

Little is known of Castagno's early life, and it is also difficult to trace his artistic development because many of his paintings are lost. As a youth he was precocious, as is demonstrated in his mural at the Palazzo del Podestà in Florence; in it he portrayed the adversaries of Cosimo de' Medici hanging by their heels. Because of this painting he was known as Andreino degli Impiccati ("Little Andrea of the Hanged Men"). He went to Venice in 1442, and frescoes in San Zaccaria are signed and dated by both him and Francesco da Faenza.

His first acclaimed works are a "Last Supper" and three scenes from the Passion of Christ, all for the former Convent of Sant'Apollonia in Florence (now known as the Cenacolo di Sant'Apollonia and also as the Castagno Museum). These monumental frescoes, revealing the influence of Masaccio's pictorial illusionism and Castagno's own use of scientific perspective, received wide acclaim. His style more closely resembles International Gothic in his altarpiece painting of the "Assumption of the Virgin" for San Miniato fra le Torri in Florence.

In 1451 Castagno continued the frescoes at San Egidio begun earlier by Domenico Veneziano (*q.v.*). The light tones that Castagno adopted for his outstanding "St. Julian" (1454–55) show Veneziano's influence. In a work for a loggia of the Villa Carducci Pandolfini at Legnaia, Castagno broke with earlier styles and painted a larger-than-life-size series of "Famous Men and Women," within a painted frame (now in the Castagno Museum, Florence). In this work, Castagno created dramatic tension by portraying movement of

"The Last Supper," fresco by Andrea del Castagno; in the Cenacolo di Sant'Apollonia, Florence

SCALA—Art Resource, New York City

body and facial expression. The architectural niches he painted to frame the figures give them a three-dimensional feeling, as if he had created sculptural forms. His last dated work is an equestrian portrait of Niccolò da Tolentino. Castagno's emotionally expressive realism was strongly influenced by Donato Donatello, and Castagno's work in turn influenced succeeding generations of Florentine and Paduan painters.

Castamon (Turkey): see Kastamonu.

castanets (from Spanish *castaño*, "chestnut"), musical instrument, a clapper consisting of two hollowed-out pieces of hardwood, ivory, or other substance, usually held in the hand and struck together. As a folk instrument played by dancers in Spain, the Balearic Islands, and southern Italy, they are pear-shaped, hinged together by a cord firmly secured to the thumb, and clapped with the fingers. Typically, a simple rhythm is performed on a pair held by the left hand, while the smaller, right-hand pair plays a more complicated rhythm.

Castanets

By courtesy of Boosey & Hawkes Ltd.

Orchestral castanets are attached to handles and shaken or fastened to a block of wood and played with the fingers or drumsticks. Similar instruments—often boot-shaped—were played by the ancient Greeks (*krotala*), Romans (*cro-tala*), and Egyptians and may have been introduced to Spain through ancient Phoenician colonization or, in their pear-shaped form, by the Moors.

caste, any of the ranked, hereditary, endogenous occupational groups that together constitute traditional societies in South Asia, particularly among Hindus in India. Although sometimes used to designate similar groups in other societies, the "caste system" is uniquely developed in Hindu societies.

Use of the term caste to characterize social organization in South Asia, particularly among the Hindus, dates to the middle of the 16th century. *Casta* (from Latin *castus*, "chaste") in the sense of purity of breed was employed by Portuguese observers to describe the division of Hindu society in western and southwestern India into socially ranked occupational categories. In an effort to maintain vertical social distance, these groups practiced mutual exclusion in matters relating to eating and, presumably, marrying. Subsequently, *cast*, or *caste*, became established in English

and major European languages (notably Dutch and French) in the same specific sense. Caste is generally believed to be an ancient, abiding, and unique Indian institution upheld by a complex cultural ideology.

Varnas. It is essential to distinguish between large-scale and small-scale views of caste society, which may respectively be said to represent theory and practice, or ideology and the existing social reality. On the large scale, contemporary students of Hindu society recall an ancient four-fold arrangement of socioeconomic categories called the *varnas*, which is traced back to an oral tradition preserved in the Rigveda (dating from perhaps 1000 BCE). The Sanskrit word *varna* has many connotations including description, selection, classification, and colour. Of these, it is colour that appears to have been the intended meaning of the word as used by the Aryan authors of the Rigveda. The Aryans (*ārya*, "noble," "distinguished") were the branch of Indo-European peoples that migrated about 1,500 BCE to northwestern India (the Indus Valley and the Punjab Plain), where they encountered the local, dark-skinned people they called the *dāha* (enemies) or the *dāsa* (servants). It is also likely that the *dāha* included earlier immigrants from Iran. The tendency of some 20th-century writers to reduce the ancient bipolar classification to racial differences on the basis of skin colour is misleading and rightly no longer in vogue.

The Aryans and the *dāsas* may have been antagonistic ethnic groups divided by physical features, culture, and language. Whatever their relations, it is likely that they gradually became integrated into an internally plural social order significantly influenced by the prior social organization of the Aryans. A threefold division of society into priests, warriors, and commoners was a part of the Aryan heritage. In an early period, membership in a *varna* appears to have been based mainly on personal skills rather than birth, status, or wealth. By the end of the Rigvedic period, however, the hereditary principle of social rank had taken root. Thus the Puruṣa (Universal Man) hymn of the Rigveda (probably a late addition to the text) describes the creation of humanity in the form of *varnas* from a self-sacrificial rite: Brahmins were the mouth of Puruṣa, from his arms were made the Rājanyas, from his two thighs, the Vaiśyas, and the Śūdras were born from his feet. The extent to which the ideology's hierarchical ordering of the four groups mirrored the social reality is unknown.

The highest ranked among the *varnas*, the Brahmins, were priests and the masters and teachers of sacred knowledge (*veda*). Next in rank but hardly socially inferior was the ruling class of Rājanya (kinsmen of the king), later renamed Kshatriya, those endowed with sovereignty and, as warriors, responsible for the protection of the dominion (*ḷṣatra*). A complex, mutually reinforcing, relationship of sacerdotal authority and temporal power was obviously shaped over a long period of time.

Clearly ranked below the two top categories were the Vaiśyas (from *viś*, "those settled on soils"), comprising agriculturists and merchants. These three *varṇas* together were deemed to be "twice-born" (*dvija*), as their male members were entitled to go through a rite of initiation during childhood. This second birth entitled them to participate in specified sacraments and gave them access to sacred knowledge. They were also entitled alongside their social superiors to demand and receive menial services from the Śūdras, the fourth and lowest ranked *varṇa*. Certain degrading occupations, such as disposal of dead animals, excluded some Śūdras from any physical contact with the "twice-born" *varṇas*. Considered untouchable, they were simply dubbed as "the fifth" (*pañcama*) category.

In the *varṇa* framework, the Brahmans have everything, directly or indirectly: "noble" identity, "twice-born" status, sacerdotal authority, and dominion over the Vaiśyas and the Śūdras, who accounted for the great majority of the people. This is not surprising, for the ancient Brahmans were the authors of the ideology. The four *varṇas*, together with the notional division of the individual life cycle into four stages, or *āśramas* (*brahmacarya*, or the years of learning and extreme discipline; *gṛhasthya*, or householdership; *vānaprastha*, or retirement; and *saṃnyāsa*, or renunciation of all worldly bonds) may at best be considered an archetypal blueprint for the good, moral life. Indeed, the Hindu way of life is traditionally called the *varṇāśrama dharma* (duties of the stages of life for one's *varṇa*). The *varṇa* order remains relevant to the understanding of the system of *jātis*, as it provides the ideological setting for the patterns of interaction that are continuously under negotiation.

Jātis. Although the term *caste* has been used loosely to stand for both *varṇa* and *jāti* (broadly, "form of existence fixed by birth"), it is *jāti*—the small-scale perspective represented by local village societies—that most scholars have in mind when they write about the caste system of India. *Jātis* and relations among them have been accessible to observers from ancient times to the present. (Hereafter *jāti* and *caste* will be used synonymously.)

Empirically, the caste system is one of regional or local *jātis*, each with a history of its own, whether this be Kashmir or Tamil Nādu, Bengal or Gujarāt. History may differ, but the form of social organization does not. Everywhere castes have traditionally been endogamous; each *jāti* was associated with one or more hereditary occupations, but certain occupations (for example, agriculture or non-traditional civil service) were caste-neutral; and there were *jāti*-specific restrictions on what and with whom one could eat and drink. And, everywhere castes were ranked vertically, with the Brahmans at the top by virtue of their inherent condition of ritual purity, and the Śūdras at the bottom. Those among the Śūdras who disposed of impure substances (body emissions, dead animals, etc.) were the "untouchables." Between the top and bottom rungs there was considerable fluidity.

It is reasonable to assume that the caste system, contrary to the popular images of its changelessness, has always been characterized by the efforts of various *jātis* to raise themselves in the social order. Such efforts have been more successful in the case of low but ritually pure castes than in the case of those living below the line of pollution. As for "untouchability," this was declared unlawful in the Indian constitution framed after independence and adopted in 1949–50.

Two routes have been available to castes that have had ambitions of upward mobility. The traditional route consists of the adoption of certain critical elements of the way of life of clean (upper) castes, such as the ritual of initiation into the status of a clean *jāti*, wearing of the sacred thread (a loop of thread worn next

to the skin over the left shoulder and across the right hip) symbolic of such status, vegetarianism, teetotalism, abstention from work that is considered polluting or demeaning, and prohibition of the remarriage of widows. The process is gradual and not always successful. The critical test of success lies in the willingness, first, of higher castes to accept cooked food from members of the upwardly mobile *jāti*, and, second, of equivalent-status castes to provide them services that are deemed demeaning.

Within the framework of traditional values, socially ambitious castes have also been known, when possible, to supplement the criterion of ritual purity by the secular criteria of numerical strength, economic well-being (notably in the form of land ownership), and the ability to mobilize physical force to emerge as the wielders of power in village affairs and in local politics. Such a *jāti* is usually referred to as the "dominant caste." It is important to distinguish between status and dominance, although in historical practice they usually coincided. An important aspect of social change today is the dissociation of ritual status from secular economic and political power.

Although a great many spheres of life in modern India are little influenced by caste, most marriages are nevertheless arranged within the caste. This is in part because most people live in rural communities and because the arrangement of marriages is a family activity carried out through existing networks of kinship and caste. (T.N.M.)

BIBLIOGRAPHY. M.N. Srinivas, *Caste in Modern India* (1962, reissued 1989), is the best general book.

caste, in biology, a subset of individuals within a colony (society) of social animals that is specialized in the function it performs and distinguished by anatomical or morphological differences from other subsets.

Social insects such as ants, bees, termites, and wasps are the main species known to have developed caste systems. Typical castes in insect societies include the queen, the sexual female responsible for reproduction; the workers, the usually sterile caretakers of the queen and her eggs and larvae; and the soldiers, defenders of the colony (and also sterile). Morphological differences between castes, which enable their members' performance of different tasks, are sometimes noted; e.g., the pollen basket on the legs of the worker honeybee (*Apis mellifera*) does not exist on the queen. In many insect species, differentiation of insect larvae into various castes is determined by diet, although hormonal and environmental factors can also affect development.

Castel Gandolfo, village and castle, Roma provincia, Lazio (Latium) regione, central Italy. It lies on the edge of Lake Albano, in the Alban Hills just south of Rome. Its palace is notable as the summer residence of the popes.

Castel Gandolfo probably occupies the site of ancient Alba Longa (q.v.). Its name is derived from a castle belonging to the ducal Gandolfi family in the 12th century. It became the inalienable domain of the Holy See in 1608 and, after the construction of the Apostolic, or Papal, Palace, the summer residence of the pontiff. The vast palace was begun by Urban VIII (pope from 1623 to 1644) and later enlarged by Alexander VII, Clement XIII, and Pius IX. With its magnificent terraced park and the former Villa Barberini, built on the ruins of a villa of the Roman emperor Domitian, it enjoys extraterritorial privileges as part of the Vatican state. The palace's reception hall has walls covered with precious marble,

brocades, and splendid tapestries and display panels by Carlo Dolci, Paolo Veronese, and Salvador Rosa. Since 1936 the Villa Barberini has housed the famous Vatican observatory, founded by Pope Gregory XIII (1572–85). In the square opposite the castle is the Church of San Tommaso di Villanova, the work of Gian Lorenzo Bernini, who also collaborated with Carlo Maderno in the construction of the palace. The village is known for its peaches, wine, and fish from the lake. Pop. (1993 est.) mun., 6,952.

Castel Sant'Angelo, also called HADRIANEUM, or SEPULCRUM ANTONINORUM, structure in Rome, Italy, that was originally the mausoleum of the Roman emperor Hadrian and, until Caracalla, the burial place of the Antonine emperors. It was built AD 135–139

Castel Sant'Angelo, Rome
Dallas and John Heaton. CLICK Chicago

and converted into a fortress in the 5th century. It is on the right bank of the Tiber River and guards the Ponte Sant'Angelo, one of the principal ancient Roman bridges. In plan, the fort is a circle surrounded by a square; each corner of the square is protected by an individually designed barbican, or outwork, while the central circle is a lofty cylinder containing halls, chapels, apartments, courtyard, and prison cells.

In 590 Pope Gregory the Great, conducting a penitential procession to pray for the end of a plague, had a vision of the archangel Michael sheathing his sword over the castle, signifying the end of the plague; from that incident came the structure's modern name and the marble statue of the archangel that surmounts the building. Throughout the Middle Ages the castle served as a refuge in times of trouble, especially for the popes, who could reach it from the Lateran through a protected passage. Clement VII took refuge there from the troops of Holy Roman Emperor Charles V during the sack of Rome in 1527. The castle continued to be used as a prison until 1901, when its restoration was begun. Part of it is now a national museum of military history.

Castelar y Ripoll, Emilio (b. Sept. 7, 1832, Cádiz, Spain—d. May 25, 1899, San Pedro del Pinatar), statesman and author, one of the most powerful champions of Spanish Republicanism in the latter half of the 19th century. He was president of the first Spanish republic from September 1873 to January 1874.

Castelar studied at the University of Madrid, where he became professor of history and was active in politics. He achieved fame as an orator and notoriety for his speeches against the monarchy; this latter activity lost him his chair in April 1865. After the abortive Re-

publican rising of 1866, he was sentenced to death, but he escaped to France. After the successful Revolution of 1868, he returned and entered Parliament as an energetic and effective defender of Republican ideals.

When Castelar assumed leadership of the republic (1873–74), Spain was at the height of disturbance and turmoil. He strengthened the army and resolutely undertook to crush rebellion. He also embarked on a policy of conciliation with the Roman Catholic church. His tactful and statesmanlike stance prevented rupture with the United States over the *Virginius* affair (Oct. 31, 1873), in which U.S. seamen were executed as pirates by Spain during a Cuban insurrection.

Castelar was ousted from office by Republican opposition to his conservative and conciliatory policies. A military coup followed, and he went into exile. After the accession of King Alfonso XII (1874–85), he returned and was elected to Parliament. He became reconciled to the monarchy but continued to champion a unitary and conservative republic that would be established and run by legal and peaceful means. As opposition leader, he found himself increasingly estranged from the revolutionary and federalistic doctrines of the extreme Republicans; yet he favoured religious toleration, universal suffrage, and the abolition of slavery in Puerto Rico.

Castelar also found time for literary and journalistic efforts and left behind him more than 90 works, including novels, histories, and political speeches.

Castell-Nedd (Wales): see Neath.

Castellammare di Stabia, city and episcopal see, *Napoli provincia*, Campania regione, southern Italy. It lies in the southeast angle of the Bay of Naples southeast of Naples. Its name is derived from the Roman resort of Stabiae (just northeast), destroyed by the eruption of Vesuvius in AD 79, and from a castle built by the Holy Roman emperor Frederick II, ruins of which remain. Noted for its hot mineral springs and baths, fine beaches, and scenic location, it is a popular summer resort and spa. The royal Villa Quisisana (1310) is now a hotel. Castellammare is also a commercial and industrial centre, with an arsenal and a large shipyard where the bathyscaphe used by the Swiss physicist Auguste Piccard for marine exploration was built. Pop. (1993 est.) mun., 67,974.

Castello Sforzesco (Milan castle and museum): see Sforzesco Castle.

Castellón, *provincia* in the *comunidad autónoma* ("autonomous community") of Valencia, eastern Spain, and northernmost of the three provinces corresponding to the ancient kingdom of Valencia. Castellón comprises three distinct regions: the inhospitable Maestrazgo in the mountainous northwest; the Mijares and Palancia river valleys, separated by the Sierra de Espadán; and the Mediterranean coastal plains. Lumbering, livestock (cattle and sheep) raising, grain cultivation, and agriculture (olives, oranges, and grapes in the valleys and almonds, figs, and pomegranates along the coast) constitute the principal economic activities of the province. Light industry (textiles, sandals, ceramic tiles) is concentrated in the provincial capital, Castellón de la Plana (*q.v.*), and in the towns of Onda, Alcora, Villarreal, and La Val de Uixó. Fisheries are based on the ports of Burriana, Vinaroz, and Benicarló. Tourism is centred on the Mediterranean beaches of the Costa del Azahar. Area 2,579 square miles (6,679 square km). Pop. (1992 est.) 442,049.

Castellón de la Plana, city, capital of Castellón *provincia*, in the *comunidad autónoma*

("autonomous community") of Valencia, eastern Spain. Castellón de la Plana is situated north of Valencia city on a fertile plain near the Mediterranean coast. Founded originally on top of the nearby La Magdalena Hill, it was captured from the Moors by James I of Aragon in 1233 and, on petition of its inhabitants in 1251, was moved to its present site on a fertile plain near the Mediterranean. It was made the provincial capital in 1833 and in 1873 was given the status of a city. Historic landmarks include the 14th-century Gothic-style Santa María Church, with a detached belfry 150 feet (46 m) high (1591–1604), and the 17th-century town hall.

Oranges, hemp, and coloured tiles are exported from the city's port, El Grao de Castellón. Tourism is based on the local beaches. Pop. (1992 est.) mun., 135,683.

Castelnau, Michel de, SIEUR (Lord) DE LA MAUVISSIÈRE (b. 1520?, La Mauvissière, Touraine, France—d. 1592, Joinville), French diplomat and soldier, noted for his *Mémoires*

Castelnau, engraving by G. Isaac
By courtesy of the Bibliothèque Nationale, Paris

of the beginnings of the Wars of Religion (1562–98).

As a young man, Castelnau served under local commanders in Piedmont and in Picardy. After the Peace of Cateau-Cambrésis (1559), he entered the king's service and was sent on diplomatic missions in 1560 to England, Germany, Savoy, and Rome. After the death of King Francis II he was charged with accompanying the widowed queen, Mary Stuart, back to Scotland.

In 1562 Castelnau returned to France to fight against the Huguenots in Brittany and Normandy. In 1572, however, King Charles IX sent him to England, Germany, and Switzerland to appease the anger aroused by the massacre of French Protestants on St. Bartholomew's Day. From 1575 he was Henry III's ambassador to Elizabeth I of England. During his years in England, he wrote his *Mémoires*, with an eye to the moral instruction of his son. Covering the years 1559–70, they provide a well-informed account of the beginnings of the Wars of Religion. The *Mémoires* were published posthumously in 1621.

He returned to France in 1585, when the Catholic League was about to dominate Paris. Because he refused to join the league, he was excluded from official appointments. Although Henry IV gave him a military command, he died in poverty.

Castelnuovo-Tedesco, Mario (b. April 3, 1895, Florence, Italy—d. March 15, 1968, Hollywood, Calif., U.S.), Italian-born composer in the Neoromantic style.

Castelnuovo-Tedesco studied under Ildebrando Pizzetti and became widely known during the 1920s. In 1939 Benito Mussolini's anti-Semitic policies led him to emigrate to the United States, where he settled in Hollywood. He appeared as soloist in his *Piano Concerto No. 2* and also wrote three violin concerti, a cello concerto, and a concerto for guitar. His orchestral works include overtures to 12 plays by William Shakespeare, many of whose sonnets and poems he set to music. He composed

two Shakespearean operas, *The Merchant of Venice* (1961) and *All's Well That Ends Well* (1957). His chamber music is scored for a variety of combinations; his piano pieces are conceived as miniature symphonic poems; his songs retain the melodiousness of the Italian school; and his harmonies are opulent and often complex.

Castelo Branco, distrito ("district"), central Portugal. To the northwest it is dominated by the mountain blocks of Estrela (6,539 feet [1,993 m]) and Guardunha (4,026 feet [1,227 m]). Between these mountains, in the upper Zêzere River valley, Cova de Beira is a rich agricultural basin watered by irrigation. The southern plateaus are poorer, rolling hills able to support only cork oak and olive groves. The district's economy also includes stock raising, growing of cereals, mining, and manufacturing. The Idanha project irrigates about 35,000 acres (14,000 hectares) from the Carmona Dam on the Ponsul River. There are important textile plants at Covilhã. Tin, zinc, and titanium are mined in the district. Area 2,555 square miles (6,616 square km). Pop. (1992 est.) 213,300.

Castelo Branco, city and capital of Castelo Branco *distrito* ("district"), central Portugal, near the border with Spain. The surrounding region was occupied by Roman legions and has many Roman ruins, but the city itself originated as an old frontier fortress and is partially enclosed by walls; it was not officially founded until 1209 by the Knights Templar, whose restored castle is a notable landmark. The cathedral and the episcopal palace are also noteworthy. Castelo Branco, noted for its hand-embroidered linen bedspreads, is an important road junction and has a flourishing local trade in cork, wine, olive oil, and cheese. Pop. (1991 prelim.) 26,410.

Castelo Branco, Camilo (b. March 16, 1825, Lisbon, Port.—d. June 1, 1890, Seide), Portuguese novelist whose 58 novels range from Romantic melodramas to works of realism. He is sometimes known as the Portuguese Balzac.

Born illegitimately into a family believed to have had a hereditary tendency to insanity, Camilo was orphaned in childhood and brought up by relatives in the austere and primitive Trás-os-Montes region of northern Portugal. Allowed to grow up undisciplined and proud, he studied irregularly at Porto, first medicine and later for the priesthood, but eventually abandoned these professions for a literary career.

For a time Castelo Branco wrote Gothic tales such as *Mysterios de Lisboa* (1854; "Mysteries of Lisbon") and *Livro Negro do Padre Diniz* (1855; "Black Book of Father Dennis"), until he arrived at his mature style with *Onde Está a Felicidade?* (1856; "Where Is Happiness?") and *Vingança* (1858; "Revenge"). Living as intently as he wrote, he engaged in a series of love affairs, culminating in his elopement with Ana Plácido, the wife of a Porto businessman. The two lovers were imprisoned for adultery (1861), during which time Camilo wrote in two weeks his best-known work, *Amor de Perdição* (1862; "Fatal Love"), the story of a love thwarted by family opposition that eventually led the hero to crime and exile. It is the typical expression of the view of life with which Castelo Branco came to be identified—a view in which passion is the irresistible force and social prejudice the immovable object, their collision often resulting in tragedy, sin, and redemption through suffering.

In 1864, after his release from prison and the death of Ana Plácido's husband, Castelo Branco settled with Ana in the village of Seide in the Minho region, where he supported himself by writing unceasingly, producing verse of indifferent quality, plays, works of erudition, and hard-hitting polemical writings. He con-

tinued to pour out novels of unequal merit, many written to order for publishers. In 1885 he was awarded the title of viscount of Correia Botelho for his writing. Despondent over his son's insanity and his own ill health and impending blindness, he committed suicide.

Camilo Castelo Branco, lithograph, 1857
By courtesy of the Casa de Portugal, London

Though many of Castelo Branco's works are on the level of popular serials, others, such as *Amor de Perdição*, *O Romance d'um Homem Rico* (1861; "The Love Story of a Rich Man"), and *O Retrato de Ricardina* (1868; "Portrait of Ricardina"), have a tragic quality and are narrated with conciseness and vigour.

Outliving the Romantic era, Castelo Branco remained a Romantic by temperament and conviction. Though the objective pictures of Minho rural life in his *Novellas do Minho* (1875–77) approach Naturalism, he engaged in a literary quarrel with the emergent Naturalist school and parodied their style and subjects in *Eusébio Macário* (1879) and *A Corja* (1880; "The Rabble"). Nevertheless, while continuing to express vehement opposition to Naturalism, he more and more closely assimilated its descriptive objectivity and verisimilitude.

Castelo Melhor, Luiz de Vasconcelos e Sousa, 3^o conde de (3rd count of), 6^o CONDE (6th count) DA CALHETA (b. 1636—d. Aug. 15, 1720), Portuguese royal favourite who, as effective governor of Portugal from 1662 to 1667 during the reign of Afonso VI, was responsible for the successful prosecution of the war against Spain, which led, in 1668, to Spanish recognition of Portugal's independence.

Shortly after Afonso VI's coming-of-age in 1662, the King appointed Castelo Melhor his secret notary (*escrivão da puridade*), a position in which the favourite was able to exercise the functions of first minister. Castelo Melhor overcame the difficulties which had hitherto beset Portugal in the war against Spain, reorganizing the troops (now reinforced by an English contingent by virtue of the English king Charles II's marriage to Catherine of Braganza) and entrusting their command to competent generals. Consequently the war entered a victorious phase for Portugal (1663–65) and Spain began peace negotiations. Agreement proved difficult to attain and meanwhile the internal political situation in Portugal deteriorated. The King was obliged to dismiss Castelo Melhor on Sept. 9, 1667, shortly before he himself was deprived of power.

Castelo Melhor went into exile in Paris and then London, but in 1685 he was permitted to return to Portugal and, two years after that, to court. On the accession of John V (1706), he was appointed a councillor of state and he continued to occupy a position of distinction until his death.

Castelrosso (Greece): see Kastellórizon.

Castelvetrano, town, Trapani province, western Sicily, Italy, southeast of Marsala. Historic monuments include the churches of S. Domenico (1470) and of the Madre (16th century). In the town hall there is a 5th-century bronze statue of the Ephebus of Selinus (Selinonte). Castelvetrano serves a wine-producing region and has a furniture industry. Pop. (1991) mun., 30,193.

Castelvetro, Lodovico (b. c. 1505, Modena, Duchy of Modena—d. Feb. 21, 1571, Chiavenna, Swiss Confederation), a dominant literary critic of the Italian Renaissance, particularly noted for his translation of and independently rendered conclusions from Aristotle's *Poetics*, in which he defended the dramatic unities of time, place, and action, as well as the use of poetry for pleasure alone; he thereby helped set the critical norms for drama in the Renaissance and the French Neoclassical period.

Nobly born, Castelvetro was a law student in Bologna, Ferrara, and Padua, then began studies of literature in Siena. After living for a time in Rome, Castelvetro returned to Modena and became prominent in literary circles and as a teacher of law. A quarrel with the poet Annibale Caro, initiated by Castelvetro's criticism of one of Caro's *canzoni*, erupted into a major literary feud that led in 1560 to Castelvetro's summons to Rome by the Inquisition, his subsequent flight from Italy, and his excommunication.

Castelvetro then lived in France and in Vienna, where his work on the *Poetics* of Aristotle, called *La poetica di Aristotele vulgarizzata* ("Aristotle's *Poetics* Popularized"), was published in 1570. Though often erroneous in transmitting Aristotle's ideas, *La poetica* was extremely influential in the history of drama and of criticism. Castelvetro emphasized realism in drama, clarified the distinction between rhetoric and poetry, and defended poetry as a means of pleasure alone—as opposed to the earlier opinion that poetry should instruct as well as delight. Another critical notion that Castelvetro took issue with was the Platonic concept that poets are possessed with a divine sort of madness (*see furor poeticus*). Castelvetro asserted that this was a myth perpetuated by the ignorant masses and by poets themselves.

Casti, Giovanni Battista (b. Aug. 29, 1724, Acquapendente, Papal States—d. Feb. 5, 1803, Paris), Italian poet, satirist, and author of comic opera librettos, chiefly remembered for the verse satires *Poema tartaro* (1787; "Tartar Poem") and *Gli animali parlanti* (1802, "The Talking Animals"; Eng. trans. *The Court and Parliament of Beasts*, 1819).

Casti took holy orders at the seminary of Montefiascone but soon abandoned the church to be a pleasure-seeking poet at the courts of Germany, Austria, and Russia. Already widely travelled, Casti left Florence for Vienna with his patron, the emperor Joseph II, in 1769. He then accompanied a minister of Maria Theresa to many European cities. Between 1778 and 1802 he wrote his witty society verse *Novelle galanti* ("Amatory Tales"), first published in a critical edition in 1925. In 1778 Casti visited the court of Catherine the Great in St. Petersburg; though he was treated well, his *Poema tartaro* mocked the adulation shown the Empress. Returning to Vienna, he was named poet laureate in 1790. After a time in Italy, he settled in Paris, where he lived for the rest of his life. There he wrote his other major work, *Gli animali parlanti*, which personifies the European nations as animals in order to contrast the monarchical concept with the republican spirit generated by the French Revolution. In addition to his society verse and his satires, he wrote comic opera librettos to the music of Antonio Salieri and Giovanni Paisiello.

Castiglione, Baldassare (b. Dec. 6, 1478, Casatico, near Mantua, Italy—d. Feb. 2, 1529, Toledo, Spain), Italian diplomat and courtier, whose *Il cortegiano* (*The Courtier*) made him the arbiter of aristocratic manners during the

Baldassare Castiglione, detail of a portrait by Raphael, 1516; in the Louvre, Paris
Giraudon—Art Resource/EB Inc.

Renaissance. Although he denied that he had drawn a portrait of himself, his life and accomplishments matched those of the cultured nobleman whom he considered the ideal courtier.

Educated in Milan at the humanist school of Giorgio Merula and Demetrius Chalcondyles, he learned the art of chivalry at the court of Ludovico Sforza and entered the service of Francesco Gonzaga, marquis of Mantua, in 1499 and that of Guidobaldo da Montefeltro, duke of Urbino, in 1507. He remained at the court of Urbino until 1513, serving Guidobaldo's successor, Francesco Maria della Rovere.

In Urbino he met Pietro Bembo, Bernardo Bibbiena, Giuliano de' Medici, l'Unico Aretino (Bernardo Accolti), Ludovico di Canossa, Ottaviano and Federico Fregoso, who became the interlocutors of his *Cortegiano*. There he also composed most of his minor works, including, besides Latin and Italian verse, the eclogue *Tirsi* (1506), in which members of the court were thinly disguised beneath the pastoral conventions, and the prologue to Bibbiena's play, *Calandria*.

He was sent to England in 1506 to receive the order of the garter for Guidobaldo. In 1509 he followed Della Rovere, commander of the papal army, in the war against Venice; in 1511 he took part with Julius II in the siege of Mirandola. For his services, he was made count of Novilara, near Pesaro. As ambassador of the duke of Urbino, he went to the court of Leo X in Rome (1513). In 1524 he was appointed apostolic prothonotary (a position with the curia concerned chiefly with record keeping) and sent to Spain as papal nuncio to Emperor Charles V in 1525.

The *Cortegiano* (written 1513–18; published 1528), in dialogue form, deals with the perfect courtier, the noble lady, and the relationships between the courtier and the prince.

The *Cortegiano*, one of the outstanding books of the century, found immediate favour outside Italy and was translated into many languages. Sir Thomas Hoby's English version, *The Courtier* (1561), was one of the most influential prose works of its day.

Castiglione, Giovanni Benedetto, byname IL GRECHETTO, French LE BÉNÉDETTE (b. c. 1616, Genoa—d. 1670, Mantua, Papal States), Italian painter and one of the most important technical innovators in the history of printmaking. Beginning in the highly artificial style of Mannerism, Castiglione was a productive painter who left portraits, historical pieces, and landscapes but who excelled in depicting fairs, markets, and rural scenes with animals. In his etchings he was influenced by the

Dutch school: he admired the prints of Van Dyck and Rembrandt. He was the first known practitioner of the monotype, or single-print technique, and was one of the earliest to make *chiaroscuro* woodcuts. In his closing years he lived in Mantua, painting for the court in a flamboyant but naturalistic Baroque style. His brother Salvatore and his son Francesco studied with him and perpetuated his manner.

Castiglioni, Goffredo (pope): see Celestine IV.

Castile, Spanish *CASTILLA*, traditional central region constituting more than one-quarter of the area of peninsular Spain. Castile's northern part is called Old Castile and the southern part is called New Castile. The region formed the core of the Kingdom of Castile, under which Spain was united in the late 15th and early 16th centuries.

The name Castile—meaning "land of castles"—is first known to have been used in about AD 800, when it was applied to a small district at the foot of the Cantabrian Mountains in the extreme north of the modern province of Burgos. Castile expanded during the 9th century but remained a fragmented collection of petty counties, whose rulers were nominated by the kings of Asturias and Leon, until the counties were united by Fernán González (d. 970), the first count of all Castile. With him the political history of Castile begins. He made the new county hereditary in his family and thus secured it a measure of autonomy under the kings of Leon. In his time the capital of the county was established at Burgos and there was expansion southward into Moorish territory. Under the counts García Fernández (d. 1005) and Sancho García (d. 1017), Castilian territory reached to the Douro (Duero) River. Relations with the kings of Leon, still nominally the suzerains of Castile, were frequently bad.

In 1029 Sancho III the Great of Navarre, the son of a Castilian mother, detached Castile from Leon and on his death (1035) awarded it to his second son, who was the first to assume the title of king of Castile, as Ferdinand I (1037–65). Later, Castile was again united with Leon (1072–1157), but thereafter the two kingdoms again separated. The political and military hegemony of Castile over Leon was established by Alfonso VIII of Castile, who forced the king of Leon to do homage to him (1188). By then Castilian rule extended far south of the Tagus River and eastward to the modern frontiers of Aragon. The Leonese kings, however, never accepted Castile's suzerainty, and Alfonso IX of Leon consequently refused to support the Castilian king Alfonso in his wars against the Islamic Berber dynasty of the Almohads. Thus, Castilian pursuit of its political hegemony over Leon served to weaken the Christian front against the Muslims. In 1230 Ferdinand III, already king of Castile, succeeded to the Leonese throne and both crowns were finally united under Castilian leadership. Meanwhile, the Muslim kingdom of Toledo in Spain had been annexed by Castile in 1085, and, by the middle of the 12th century, Castilian political hegemony in Spain was an accomplished fact. European courts in the later Middle Ages frequently identified Castile with Hispania (Spain). The final Christian conquest of most of Moorish-held Andalusia, in the extreme south, was carried out in the time of Ferdinand III.

An attempt in 1383–85 by Castile to an-

nex Portugal by force failed, but in 1412 a Castilian prince, Ferdinand I, was successfully placed on the Aragonese throne, partly as a result of Castilian financial support and military force. This move foreshadowed the personal union of the two crowns under Ferdinand and Isabella (1479). The Spanish part of the Kingdom of Navarre was annexed by Castile in 1512, thus completing the formation of modern Spain.

The literary language of Spain after its unification was the Castilian vernacular, and the centre of political and administrative power in Spain has since always been Castile. The Spanish culture transmitted to Latin America was also largely Castilian. Nevertheless, opposition to Castile's political hegemony from the other regions, which enjoyed complete or partial independence in the Middle Ages, remains strong. It continues to be a live issue, especially since Spain's centres of industrial strength lie largely outside Castile, whose geography has made it an economically backward area. It has been claimed, with some exaggeration, that medieval Castile was a more progressive kingdom than its neighbours, with a more developed sense of unity and national destiny. Its dominant role in Spanish history may well have stemmed from the superior martial spirit and military organization of its people.

Castile, New (Spain): see New Castile.

Castile, Old (Spain): see Old Castile.

Castile-La Mancha, Spanish *CASTILLA-LA MANCHA, comunidad autónoma* ("autonomous community") and historic region of Spain, encompassing the central Spanish provinces of Toledo, Ciudad Real, Cuenca, Guadalajara, and Albacete.

The autonomous community, established in 1982, is bounded by the provinces of Cáceres and Badajoz to the west, Córdoba, Jaén, and Murcia to the south, Alicante, Valencia, and Teruel to the east, and Zaragoza, Soria, Segovia, Madrid, and Avila to the north. The watershed of the low-lying Toledo Mountains bisects the region, with tablelands of La Alcarria to the north being drained by the Tagus (Tajo) and the plains of La Mancha to the south being drained by the Guadiana. La Alcarria merges with the Central mountain system to the north and the Iberian range to the east; the plains of La Mancha extend southeastward into the province of Albacete, terminating in the Baetic range. The Morena mountain range rises in the south. A Mediterranean climate, modified by continental influences, prevails: temperatures rise east to west and north to south. Annual precipitation is relatively low, exceeding 20 inches (500 mm) only in the province of Cuenca, and is concentrated in the autumn and spring.

Emigration to the job market of Madrid, the national capital, just to the north, has depleted the population of Castile-La Mancha. This effect has been much more severe in the mountainous zones of the provinces of Cuenca and Guadalajara than in the provincial capitals, where the population has doubled since 1900. Emigration has been especially high among young men, with the result that the median age has increased sharply while the birth rate has plummeted. Emigration to the countries of the European Economic Community has generally been low, though large numbers of migrants work in France. The population tends to be dispersed in the Iberian mountains and concentrated in the plains of La Mancha, where large agricultural towns predominate. The population density increases in lower La Mancha, where the water table is close to the surface and supports a diversified agriculture. Farmland in La Mancha tends to be partitioned into *latifundios*, or large estates, while *minifundios*, or small landholdings, predominate north of the Tagus.

Agriculture dominates the economy. Most of the land under cultivation is dry-farmed, producing wheat, grapes, and olives. The region also produces sunflower, saffron, sumac, and cotton. Mechanization of agriculture has been impeded by the fragmentation of holdings in the mountains and lags behind the national average. Animal husbandry accounts for approximately one-third of the region's agricultural output and is concentrated in the province of Guadalajara; the preferred animals are sheep, pigs, and goats. Forests cover one-third of the land but have yet to be fully exploited.

The industrial sector is underdeveloped outside the province of Ciudad Real, where a large petroleum refinery has established Puertollano as a major petrochemical centre. The mines of Almadén produce mercury. Mining is of relatively little importance outside Ciudad Real, though there are important deposits of iron in Guadalajara province and kaolin is mined in Cuenca. Manufacturing is small-scale and centres on the processing of primary materials. The region produces about one-half of Spain's wine and mills a large portion of the nation's flour.

The provincial capitals are the leading commercial centres of the region. The provinces of Toledo and Guadalajara also have strong commercial ties to Madrid, while Talavera de la Reina in Toledo province is the commercial centre of some 80 communities. Energy resources are poor, the general dryness of the region precluding the development of hydroelectricity. A nuclear reactor is located in Zorita de los Canes.

The National Museum of Abstract Art was established in the city of Cuenca in 1966. The polychromatic ceramics produced in the province of Toledo have been widely marketed since the 14th century; colours are clearly delineated, and designs show Mudejar (Moorish), Gothic, and Renaissance influences. The ceramics of Talavera de la Reina were especially popular during the Renaissance but were in decline by the second quarter of the 18th century. The town of Atienza in the province of Guadalajara features a Caballada every Pentecost, in which townsmen ride to the hermitage of Nuestra Señora de la Estrella outside Atienza and reenact the rescue of Alfonso VII by townsmen in 1163. Pop. (1986 est.) 1,670,091.

INDEX
first

Castile-León, Spanish *CASTILLA-LEÓN, comunidad autónoma* ("autonomous community") and historic region of Spain, encompassing the north-central Spanish provinces of Valladolid, Burgos, León, Salamanca, Zamora, Palencia, and Segovia.

The autonomous community, established in 1983, is bounded by the provinces of Orense and Lugo to the northwest, Oviedo and Santander to the north, Vizcaya and Alava to the northeast, Logroño and Soria to the east, Guadalajara and Madrid to the southeast, and Avila and Cáceres to the south. Portugal adjoins the provinces of Salamanca and Zamora to the west. Castile-León belongs to the elevated Central Plateau and is drained by the Douro (Spanish Duero) River, which flows east to west and bisects the region. The Cantabrian Mountains rise to the north and are separated from the Ibérico Mountains to the northeast by an important topographic and communication corridor, La Bureba. The Central range rises to the south, while the highlands of Ancares, Caurel, and Eje decline gradually into Portugal. A continental climate, modified by oceanic influences, prevails. Annual precipitation is low, ranging from 16 to

24 in. (400 to 600 mm), and is concentrated in the autumn and spring. Precipitation is higher in the mountains, where snow is common.

Castile-León's population as a percentage of Spain's has declined sharply since 1900. Emigration from the countryside has been especially high, with the result that the population is increasingly concentrated in the towns and especially in the provincial capitals. The towns of the peneplains are ordinarily more nucleated than the villages bordering the Cantabrian Mountains and Sistema Ibérico. *Minifundios*, or small landholdings, predominate in the countryside and are cultivated by their owners. Pastures and woodland continue to be communal in the mountainous borderland of Zamora and León.

The fragmentation of farmland has hindered the mechanization of agriculture and a disproportionately high percentage of the work force continues to be employed in agriculture. Most land is dry farmed and wheat is the leading crop. Grapes are largely restricted to marginal farmland and are of declining importance. Irrigation is widespread in the provinces of Valladolid and León; crops include sugar beets, potatoes, and French beans. Animal husbandry accounts for a large percentage of the region's agricultural output. The leading animals are sheep and dairy and beef cattle, while the number of horses and mules is declining. Chickens are raised in the province of Valladolid. Forestry is a major industry in the mountainous zones.

The development of industry did not begin until 1945 and remains modest. The Instituto Nacional de Industria has fostered the industrialization of Valladolid through long-term loans and tax incentives; that city's manufactures are diversified and include automobiles, fertilizers, and paper. The industrial development of Burgos was initiated in 1964 and has established the city as a leading industrial centre of the region. The provinces of León, Zamora, and Salamanca produce about one-fourth of Spain's anthracite, and the mountains of Puebla de Lillo in the province of León have extensive deposits of talc.

Dams in the provinces of Salamanca and Zamora generate a quarter of Spain's hydroelectricity; installed capacity exceeds 2,000,000 kilowatts. Most of the electricity generated in the region is exported to the industrial centres of the Basque provinces and Madrid.

The Leonese dialect heard in parts of the region derives from the vernacular of the Visigothic period; it is spoken in León, Zamora, Salamanca, and Valladolid provinces. Farmsteads in the mountains are ordinarily multistoried and built of stone and wood, while those in the centre of the region are built of adobe. Endogamy was prevalent in the Leonese town of Maragatería well into the 19th century. The social order of the town of Maragatería was matriarchal until the late 19th century: women worked in the fields while the men were muleteers. Marti Teleno, a variant of the god Jupiter, was associated with the nearby hills. Pop. (1982 est.) 2,543,856.

Castilho, António Feliciano de (b. Jan. 28, 1800, Lisbon—d. June 18, 1875, Lisbon), poet and translator, a central figure in the Portuguese Romantic movement.

Although blind from childhood, he became a classical scholar and at the age of 16 published a series of poems, translations, and pedagogical works. Castilho's literary life may be divided into two phases, the midpoint occurring during the revolutionary period of the late 1840s. During the first he published a series of poems in which he tried to assimilate current Romantic trends while continuing to be guided by a basically Neoclassical spirit.

With the publication of his *Obras Completas* in 1837, Castilho gained recognition and became a literary figure in Lisbon. In the same year he was offered the directorship of an

Castilho, portrait by an unknown artist

important journal, *O Panorama*, and in 1838 he began to collaborate with Almeida Garrett, the leading Portuguese Romantic poet, in the revival of national theatre. His romantic narratives of the lives of Portuguese medieval heroes, *Quadros Históricos de Portugal*, were begun in 1838, and in 1842 he took charge of the *Revista Universal Lisbonense*, a major cultural review.

The second phase of Castilho's career began after his return from a two-year residence in the Azores (approximately 1848–50), where he had promoted agriculture as a means of social reform. His acceptance of Romanticism was never wholehearted. Scholarly rather than imaginative, he began to return to a genteel traditionalism having much in common with the earlier generation of Portuguese arcadian poets. His personal prestige was at its height, however, and his lifeless style so dominated literary taste that it brought about a rebellion from the younger generation of writers. The attack against Castilho came from the young poet Antero de Quental, who wrote the pamphlet *Bom-senso e Bom-gosto* (1865; "Good Sense and Good Taste") in reply to Castilho's criticism of certain younger writers. This riposte gave rise to one of the most celebrated polemics in Portuguese literature, the *questão Coimbrã* ("Coimbra question"), which eventually dethroned Castilho as literary dictator.

Castilian dialect, Spanish CASTELLANO, a dialect of the Spanish language (*q.v.*), the basis of modern standard Spanish. Originally the local dialect of Cantabria in north central Spain, Castilian spread to Castile. After the merger of the kingdoms of Castile, Leon, and Aragon in the late 15th century, it became the standard language of all Spain and in the following centuries the language also of Spanish America.

Castilla (region, Spain): *see* Castile.

Castilla, Ramón (b. Aug. 27, 1797, Tarapacá, Peru—d. May 25, 1867, Arica, Chile), soldier and statesman who, as president or as the power behind the scene, dominated Peruvian politics for nearly 20 years. A conservative himself, he wisely offered concessions to all sectors of Peruvian society and provided the nation with a long period of political stability and economic progress.

As a young man he fought for the Spaniards until he was captured by the Chilean patriots. He then fought against the Spaniards in Peru, performing heroically with José de San Martín and Simón Bolívar. In the anarchy that followed the death of Pres. Agustín Gamarra in 1841, Castilla assumed power and was elected president the following year (1845). He served until 1851 and then overthrew the next president, José Rufino Echenique, in 1855, to rule until 1862.

When Castilla seized power, Peru had been racked by disorder and rebellions for almost 20 years. A strong and skillful leader, he had the good fortune to be in power when Peru's huge supplies of guano and sodium nitrate were discovered. The income from these resources helped him bring about economic im-

provements, reduce the nation's debt, build schools, improve transportation, and foster domestic business. He also abolished Negro slavery and the head tax on Indians, and, although he was a strong supporter of the church, he eliminated the church courts and the compulsory tithes. In 1860 he supported Peru's new constitution, which narrowed the franchise, gave wide powers to the president, and recognized the Roman Catholic Church exclusively; it remained in force until 1920.

When Castilla's paternal despotism ended in 1862, the nation once again lapsed into 20 years of chaos and rebellion.

Castilla la Nueva (Spain): *see* New Castile.

Castilla la Vieja (Spain): *see* Old Castile.

Castillejo, Cristóbal de (b. 1490?, Ciudad Rodrigo, Spain—d. probably June 12, 1550, Vienna), poet who was the foremost critic of the Italianate innovations of the Spanish poet Garcilaso de la Vega and the Catalan poet Juan Boscán.

While very young, Castillejo entered a monastery, but in 1525 he became the personal secretary to Ferdinand, brother of Charles I of Spain (Charles V of the Holy Roman Empire), and went to Vienna when Ferdinand became king of Austria.

One of the last Spanish poets to use the medieval octosyllabic line exclusively, he ruthlessly attacked the new Italianate metres introduced by his contemporaries, writing *Contra los que dejan los metros castellanos y siguen los italianos* (c. 1540; "Against Those Who Abandon Castilian Metres for Italian Ones") in rhymed couplets. He championed the superiority of the traditional Spanish metre. He is also known for his erotic poetry, *Sermón de amores* (1542), which was suppressed in part by the Inquisition because of the levity with which it treated sacred texts.

Castillo, Michel del, in full MICHEL-XAVIER JANICOT DEL CASTILLO (b. Aug. 2, 1933, Madrid), Spanish-born novelist writing in French, who became famous at 24 for a short novel, *Tanguy* (1957; *A Child of Our Time*, 1958). Though written as fiction, it is the actual story of his experiences as a political refugee and a prisoner in concentration camps; and, like *The Diary of Anne Frank*, it has the poignancy of a child's witness to cruel historical events.

Del Castillo fled Spain for France as a boy in 1939 with the exodus of refugees at the end of the Civil War. Shortly after, with his mother, who was a political radical, he was sent to Nazi concentration camps.

Tanguy and *Le Colleur d'affiches* (1958; *The Disinherited*, 1959) deal with these two traumatic experiences. They show the disarray of a young mind prematurely falling prey to political skepticism and religious doubt, without losing faith in mankind. They reflect his anguish at social injustice and his need for solace in brotherhood.

Deeply attached to Spain, he returned to its strife-torn soil in *La Guitare* (1957; *The Guitar*, 1959) and in *Le Manège espagnol* (1960; *Through the Hoop*, 1962), a colourful but heavy-handed satire of religion. Later works include *Les Louves de l'Escorial* (1964; "The She-Wolves of the Escorial"), *Gerardo Lain* (1967; *The Seminarian*, 1969), *Le Silence des pierres* (1975; "The Silence of Stones"), *Le Sortilège espagnol* (1977; "Spanish Sorcery"), and *Les Cypres meurent en Italie* (1979; "The Cypresses Die in Italy").

Briefly an actor, he played the role of a Spanish Loyalist in the film taken from Sartre's short story *Le Mur* (1939; "The Wall").

Castillo de San Marcos National Monument, site of the oldest masonry fort in the U.S., built by the Spaniards on Matanzas In-

let between 1672 and 1696 to protect the city of St. Augustine, in northeastern Florida, U.S. Established as Fort Marion National Monument in 1924, it was renamed in 1942. It has an area of 20 ac (8 ha). The fort is a bastioned structure of coquina (shell stone) with walls 30 ft (9 m) high and 12 ft thick, surrounded by a moat. It played an important role in the Spanish-English struggle for the Southeast (1650-1750) and was later held by the English (1763-83). After the U.S. acquired Florida in 1819, it served as a military prison.

Castillo Solorzano, Alonso de (b. 1584, Tordesillas, Spain—d. 1648), Spanish novelist and playwright whose ingenuity expressed itself best in his short stories.

His father served in the court of the Duke of Alba and the son with the Marqués del Villar and two marqueses de los Vélez. His stories are usually of adventure but treated with wit and sophistication. Many of his tales are strung together by an artifice or are arranged, in indirect imitation of the *Decameron*, within a framework. Examples are: *Jornadas alegres* (1626; "Gay Trips") and *Noches de placer* (1631; "Nights of Pleasure"). His picaresque novels make much of the female *picara* ("rogue") as protagonist or adjutant.

Castillon, Battle of (July 17, 1453), the concluding battle of the Hundred Years' War between France and England.

The French had won Guyenne and Gascony back from English rule in 1451, but their long-unfamiliar regime soon proved objectionable to many of the inhabitants, who therefore welcomed the arrival at Bordeaux of an English army under the Earl of Shrewsbury (John Talbot) in October 1452. In the following summer French forces, powerfully armed with Jean Bureau's recently introduced field artillery, approached for a second reconquest of Guyenne—to start with the siege of the pro-English stronghold of Castillon, on the lower Dordogne River upstream from Libourne. They fortified their camp outside Castillon very strongly; and Shrewsbury, having advanced against them with 1,000 horsemen some way ahead of his 5,000 footsoldiers, attacked the camp prematurely in the mistaken belief that it was being abandoned. The French cannon inflicted heavy losses on the dismantled cavalry; and though some of Shrewsbury's infantry came up during the hour of battle, the English troops were finally routed by a sortie. Shrewsbury was killed, the garrison in Castillon surrendered the next day, and the capitulation of Bordeaux in October restored Guyenne and Gascony to France and ended the war.

Castine, historic resort town, Hancock county, southern Maine, U.S., on a promontory in Penobscot Bay, across the water from Belfast (west). For 200 years the place held a key position in the struggle between England and France, and to a lesser extent the Netherlands, for control of the Acadian seaboard. In 1613 the French constructed a trading post (later Ft. Pentagoet) at the site. A Plymouth Colony trading post was also built there in 1626 but was attacked by French buccaners in 1632. French Capuchin and Jesuit missions were established in the vicinity in the 1640s. The Frenchman Jean-Vincent d'Abbadie, Baron St. Castin (for whom the town was named), lived there (1667-97); he married the daughter of a local (Tarratine) Indian chief and played a prominent role in conflicts with the British and Dutch. The site was permanently settled by English colonists in 1760. During the Revolutionary War, a naval expedition in which Paul Revere participated, unsuccessfully tried to take Castine in 1779 from the British who held it until 1783. The

much harassed settlement was finally incorporated in 1796 only to be again occupied by the British for nearly a year during the War of 1812.

The town has more than 100 historic markers. Landmarks include Ft. George (built by the British in 1779 and partially restored as a state memorial) and earthwork remnants of Ft. Madison (built by the Americans in the War of 1812 and reconstructed during the Civil War). The Wilson Museum displays colonial, Revolutionary, and Indian artifacts. The "State of Maine" (the former USNS "Upshur") is a 7,000-ton training ship anchored at the dock of the Maine Maritime Academy (founded 1941 in Castine). Pop. (1990) 1,161.

casting, in the metal and plastics industry, the process whereby molten material is poured or forced into a mold and allowed to harden. See *founding*.

castle, medieval European stronghold, generally the residence of the king or lord of the territory in which it stands. The word is sometimes applied to prehistoric earthworks, such as Maiden Castle, England; and the word is also applied, in various linguistic forms (e.g., *château*, *castello*, or *Burg*), to princely mansions or country seats.

The castle developed rapidly in western Europe from the 9th century. Fortifications built in France in the 10th century often included

Harlech Castle, Merioneth, Gwynedd, Wales, founded by Edward I in 1285

A.F. Kersting

a high mound encircled by a ditch and surmounted by the leader's particular stronghold, as in the castles at Blois and Saumur. Later, one or more baileys or wards (grounds between encircling walls), were enclosed at the foot of the mound. During the 11th century this type of private fortress, known as the "motte [mound] and bailey" castle, spread over western Europe.

The thickness of castle walls varied according to the natural strength of the sites they occupied, often varying greatly at different points of the site. The defense of the *enceinte*, or outer wall, of the castle was generally by means of one or more lines of moats, the moats being crossed in front of the gateways by drawbridges—i.e., bridges that could be drawn back or raised from the inner side in order to prevent the moats from being crossed. The gateway was often protected by a barbican, a walled outwork in front of the gate; and the passage through the gateway was defended by portcullises, doors, and machicolations. Portcullises were generally made of oak, plated and shod with iron, and were moved up and down in stone grooves, clearing or blocking the passage. Machicolations were of two kinds, some being openings in the roof of the passage through which missiles were thrown on enemies forcing their way through,

and others extending between the corbels of the parapets of walls and gates through which lethal missiles could be shot or dropped on the enemy below.

The baileys at the foot of the mound were enclosed by palisades and later by walls and towers of masonry. Almost at the same time that the shell keep was being erected in western Europe, the rectangular keep, a more compact form of citadel, was also being built. Examples are the donjon at Loches, Fr. (c. 1020), and the keep at Rochester, Eng. (c. 1130).

The keep, or donjon, was the focal point of the castle, to which, in time of siege, the whole garrison retired when the outer works had fallen; it was therefore the strongest and most carefully fortified part of the defenses. It had a well; contained the private apartments, offices, and service rooms; and held all the appointments necessary to sustain a long siege. Often the keep stood in line with the outer line of defenses, so that while one side looked toward the bailey (or succession of baileys) commanding the operations of the defense there, the other side commanded the field and the approaches to the castle. The side of the keep exposed to the field also presented a line of escape.

After the Third Crusade (1189-92), the site chosen for a new castle, where such choice was possible, was the summit of a precipitous hill, the citadel being backed against the cliff. The main defense was concentrated in the direction of approach, and here there were often two or three lines of advance fortifications. The living quarters—with the hall, domestic offices, and chapel—were then all built in the court of the inner bailey. The keep (often no longer the residence but the last line of defense) was smaller than those built previously but of more powerful design.

Development in the use of firearms was so rapid during the 15th and 16th centuries as to require a radical change in military architecture. French troops marched through Italy in 1494 and, with their guns, reduced castle after castle with astonishing rapidity. The age of the medieval castle came to an end and the era of modern military fortification opened. The principle governing the design of the new forts constructed all over Europe was that the whole building should be concentrated in one compact block. Its low walls could be defended all around by artillery, the guns being mounted on bastions and redans.

Although the break with the past did not occur suddenly, but extended over many years, there came to be from the time of the Renaissance a complete separation between military and domestic architecture; the former being a latter under military control of the monarch, the latter an unfortified palace, mansion, manor house (*q.v.*), or *hôtel*.

castle, in ship construction, structure or area raised above the main deck for combat or work purposes. The name was derived from early similarities to fortress turrets. The fore-castle and aftercastle (or sterncastle) are at the bow and stern of the vessel. A top castle was perched on masts of some ships about the 13th century. The first known castles are shown amidships or astern on Roman ships, to afford vantage points in sea skirmishes. Fore-castles were constructed on Viking ships as early as the 8th century. By the 14th century, the forecastles and aftercastles had become a part of the hull, rather than an added tower. The aftercastle on 15th-century galleys was used by officers, and naval enlisted men have traditionally been quartered in the area of the fore-castle. The fore-castle remained the designation for the area around the foremast in 19th-century men-of-war, although the deck was flush from bow to stern. Many cargo vessels have a fore-castle (deck). The after-castle was superseded by the quarterdeck.

Castle, Vernon and Irene, original names VERNON BLYTHE and IRENE FOOTE (respectively b. May 2, 1887, Norwich, Norfolk, Eng.—d. Feb. 15, 1918, Fort Worth, Texas, U.S.; b. 1893, New Rochelle, N.Y., U.S.—d. Jan. 25, 1969, Eureka Springs, Ark.), U.S.

Vernon and Irene Castle
Arthur Todd

husband-and-wife dancing team, famous as the originators of the one-step and the turkey trot.

Vernon and Irene were married in 1911 and as dance partners became famous worldwide. They popularized such dances as the glide, the castle polka, the castle walk, the hesitation waltz, the maxixe, the tango, and the bunny hug.

They wrote *Modern Dancing* (1914) together, and after Vernon was killed in an aviation accident while training cadets to pilot planes during World War I, Irene wrote *My Husband* (1919). In 1939 a motion picture starring Ginger Rogers and Fred Astaire, *The Story of Vernon and Irene Castle*, was released, and in 1958 Irene published *Castles in the Air*.

castle guard, in the European feudal tenure, an arrangement by which some tenants of the king or of a lesser lord were bound to provide garrisons for royal or other castles. The obligation would in practice be discharged by subtenants, individual knights who held their fiefs by virtue of performing such service for a fixed period each year. Because the castle concerned might be far from the fiefs charged to guard it (e.g., knights of Northamptonshire in the English Midlands had to garrison Dover Castle on the south coast), the duty was early commuted for money payments. Some castle guards, or ward rents, survived into modern times.

Castle Hill Rising (March 4–5, 1804), the first rebellion in Australian history. Involving Irish convicts (for the most part, political offenders), the uprising began with the rebels' seizure of the New South Wales convict station at Parramatta on March 4 and culminated in a clash between the rebels and government troops on the following day. The actual scene of this clash was Vinegar Hill (now called Rouse Hill), about 10 miles (16 kilometres) from Castle Hill.

By the night of March 4, the Sydney authorities had learned of the uprising and placed the troops of the New South Wales Corps and the settlers' Loyal Associations (two companies of militia formed in 1800) on alert. On March 5, however, only 57 troops and a few settlers were sent to face the 400 convicts who had taken up positions on Vinegar Hill. After two unsuccessful attempts to negotiate with the rebels, the troops opened fire. The convicts

fled under the barrage, leaving 15 dead and many wounded. The rebellion was broken.

The rebel leader, Philip Cunningham, was captured on March 5 and immediately hanged (martial law was in effect for the area from March 5 until March 10). Later, eight other convicts were tried and hanged as well.

Castle Morpeth, district (borough), county of Northumberland, extreme northern England, occupying an area of 239 sq mi (619 sq km) in the southeastern part of the county. It adjoins on its northwestern border the heavily industrialized metropolitan county of Tyne and Wear and borders the North Sea on the northeast; it is separated from Scotland by its neighbouring district of Alnwick (north). Castle Morpeth district lies on a coarse sandstone upland, where highest elevations reach about 700 ft (215 m), that descends to the east in a series of scarps to a coastal plain with low cliffs backed by sand dunes; on the west it borders the Cheviot Hills and associated moorlands. The district is generally covered by fertile unstratified glacial drift, and the onshore and offshore coastal areas are underlain by coal deposits. Mixed farming (including cattle, sheep, cereals, potatoes, and clover) prevails throughout.

Population in the district is concentrated in the southeast at Ponteland, a residential suburb of Tyne and Wear, and at Morpeth and Lynemouth, two mining centres of the declining Northumberland coalfields. An undersea coal bed mined with modern technology and one of Great Britain's first aluminum smelters (constructed 1974) have contributed to the local economic resurgence of Lynemouth. Morpeth, the district seat, has light engineering industries.

Numerous fortified manors and peel towers (small, massive, fortified towers built to protect livestock and commoners) bear witness to the English-Scots warfare in the area during the Middle Ages. A section of the east-west trending Hadrian's Wall, built by the Romans in the 2nd century AD, crosses the district near the village of Heddon-on-the-Wall in the extreme south. Pop. (1998 est.) 50,200.

Castle Point, district, county of Essex, southeastern England, occupying an area of 17 sq mi (44 sq km) on the north side of the Thames near its mouth. Castle Point is a low-lying district of tidal inlets and reclaimed land protected by embankments and dikes. The parishes (towns) of Canvey Island to the south and Benfleet on the mainland to the north experienced rapid residential growth in the 1960s and 1970s. Canvey Island, the nearest seaside resort to London, has a great many summer cottages and camper hook-up sites. Boating is especially popular in the vicinity.

Printing, engraving, and furniture-making industries and some market gardening are based in Castle Point. Canvey Island has facilities for the storage of liquefied natural gas and for refining petroleum. The district derives its name from the local medieval Hadleigh Castle, which the artist John Constable made the subject of a powerful landscape. The district seat is at Thundersley within Benfleet town. Pop. (1998 est.) 84,500.

Castle Rising, parish, West Norfolk district, county of Norfolk, England. A great Norman castle, with a square, massive keep, stands within a 12-ac (5-ha) enclosure formed by artificial ramparts of earth and a ditch, which is crossed by an ancient bridge. The incorporated town that grew in its shelter in the Middle Ages, with important fairs and markets, later decayed and was disfranchised in 1832; it is now a mere village with a late-Norman church.

Castlebar, Irish CAISLEÁN AN BHARRAIGH, market and county town, County Mayo, Ireland, at the head of Lough (lake) Castlebar. The town was founded early in the 17th cen-

tury and was incorporated in 1613. It is now an active angling centre and has a small airport and bacon-curing and hat-making factories. Pop. (1991) 6,073.

Castlemaine, city in southern Victoria, Australia, located 8 mi (13 km) east of the Lodden River and 78 mi northwest of Melbourne. In 1836 the area was crossed by Maj. Thomas Mitchell, and in 1851 gold was found in Specimen Valley. The mining settlement employed about 30,000 miners and was called alternatively Forest Creek and Mount Alexander. Capt. William Wright, the chief goldfields commissioner, later named the settlement after his uncle, Viscount Castlemaine. By the 1880s the gold deposits were depleted. Today Castlemaine is the centre of a farming and fruit-growing district and has light manufacturing. The city has a botanical garden, a provincial art gallery, and a restored market (built 1861–62) that serves as a museum. Inc. town, 1950. Pop. (1996) 6,690.

Castlemaine, Barbara Palmer, countess of, née VILLIERS: see Cleveland, Barbara Villiers, duchess of.

Castlemainian Stage, time division of the Ordovician Period in Australia and New Zealand (the Ordovician Period began about 500,000,000 years ago and lasted about 70,000,000 years). The Castlemainian Stage precedes the Yapeenian Stage and follows the Chewtonian Stage. Several graptolite fossil zones, shorter divisions of time within the stage, are recognized in the Castlemainian and are based on various subspecies of *Iso-graptus caduceus*. Castlemainian faunas show affinities with North American and European faunas.

Castlereagh, Irish AN CAISLEÁN RIABHACH, district, Northern Ireland, located directly southeast of Belfast, from where it is administered. Formerly astride Down and Antrim counties, in 1973 Castlereagh was established as a district covering 33 sq mi (84 sq km) of rolling lowlands bordering the districts of Lisburn to the southwest, North Down to the north, Ards to the east, and Down to the south. What is now Castlereagh district was settled in the 14th century by the O'Neill clan of Ulster, whose main stronghold was Grey Castle (no longer extant) from which the district takes its name. Composed largely of post-World War II residential developments and having substantial agricultural land, Castlereagh is closely linked to eastern Belfast, where many of its residents are employed in shipbuilding, aircraft manufacturing, and related industries. There is an industrial park at the planned suburb of Newtownbreda. Castlereagh district is traversed by several roads extending southeast from Belfast. Pop. (1998 est.) 64,500.

Castlereagh, Robert Stewart, Viscount, also called (from 1821) 2ND MARQUESS OF LONDONDERRY (b. June 18, 1769, Dublin—d. Aug. 12, 1822, London), British foreign secretary (1812–22), who helped guide the Grand Alliance against Napoleon and was a major participant in the Congress of Vienna, which redrew the map of Europe in 1815.

Castlereagh was one of the most distinguished foreign secretaries in British history. He is equalled only by Marlborough in the personal ascendancy that he gained as British representative in the European diplomacy of his time. He took a leading part in bringing together the alliance of great powers that finally overthrew Napoleon and in deciding the form of the peace settlement of Vienna. The concept of a Concert of Europe was largely his creation, and his influence did much to promote the practice of diplomacy by conference.

Stewart was the son of Robert Stewart, an Anglo-Irish landowner, who was elevated to the peerage in 1789 and later promoted earl (1796) and ultimately marquess (1816) of Londonderry. On his father's death Castlereagh became the 2nd marquess of Londonderry. Educated at Armagh and St. John's College, Cambridge, he was elected to the Irish Parliament of 1790 as an independent member. In 1794 he married Emily Anne Hobart, a beautiful if slightly eccentric woman to whom he remained devotedly attached throughout their long and childless marriage. From March 1798 he served as acting chief secretary to his relative Earl Camden, then lord lieutenant of Ireland. In November 1798 he was formally appointed to that office by Camden's successor, Lord Cornwallis.

Castlereagh's tenure as chief secretary coincided with the two most important events of

Irish history in the late 18th century: the 1798 rebellion and the union with Great Britain. While taking severe and successful measures to quell the revolt in 1798, Castlereagh shared the view of Cornwallis that a policy of clemency was essential to end the disturbances. The threat of French invasion and the 1798 rebellion convinced Castlereagh of the need for a parliamentary union with Britain. The passage of the Act of Union through the Dublin Parliament in June 1800 provided the first great demonstration of Castlereagh's abilities as he singlehandedly forced the measure in the Irish Commons against bitter Protestant opposition. He believed that the union with Britain must be accompanied by the political emancipation of Roman Catholics. When, in February 1801, Pitt failed to obtain George III's consent to emancipation, Cornwallis and Castlereagh at once sent in their resignations.

Though out of office after May 1801, Castlereagh continued to advise Henry Addington's ministry on Irish questions, and in July 1802 he was appointed president of the Board of Control responsible for Indian affairs. His energy and intellectual powers gained him an immediate influence in the Cabinet, and, after Pitt's return as prime minister (May 1804), he also became in July 1805 secretary of state for war. His first important task, the dispatch of a British expeditionary force to Hanover, was rendered ineffectual by Napoleon's victory at Austerlitz (December 1805); but the move convinced Castlereagh of the strategic value of the British Army in continental warfare. On Pitt's death in January 1806 he left office and became the chief opposition spokesman on foreign and military affairs. He returned to the War Department in the Duke of Portland's ministry in 1807 and showed his determination to engage in

major warfare against a continent now completely dominated by Napoleon. The adoption in 1808 of his plan for reorganizing the regular, reserve, and militia forces provided the country with adequate home defenses and a larger and more efficient army for overseas operations. When the Spanish revolt against Napoleon broke out the same year, it was decided at once to send a major expedition to the peninsula. Castlereagh was influential in securing the command for Sir Arthur Wellesley (later duke of Wellington) in 1809. In 1809 a British expedition sent by Castlereagh against Napoleon's naval base at Antwerp was allowed to waste away of disease on the island of Walheren. The disaster was in no way Castlereagh's fault, but it brought to a head the long-standing divisions and intrigues in the Cabinet. Since March 1809, George Canning, the foreign secretary, had been pressing for a change of policy, and even before the Walcheren expedition he had secured secret agreement to the replacement of Castlereagh by the marquess Wellesley. When Castlereagh learned of the ignominious position in which Canning had placed him, he challenged him to a duel that was fought September 21. Canning was slightly wounded and both men later resigned office. Castlereagh remained out of office for the next two and a half years.

In 1812 he rejoined the government as secretary for foreign affairs, and after Prime Minister Perceval's assassination in May he became leader of the House of Commons. British foreign policy then passed for a decade under unified control. Castlereagh's first task was to hold together the shaky and distrustful elements in the general European opposition to Napoleon; but as the end of the war drew near he worked increasingly to obtain preliminary agreement among the allies for the resettlement of Europe. In talks in Châtillon in 1814, he secured acceptance in principle of his plans for a peace settlement under the control of the great powers. By the Treaty of Chaumont (March 1814), he obtained provision for allied cooperation for 20 years after the war. On the fall of Napoleon the Treaty of Paris (May 1814) secured immediate British requirements (the restoration of the Bourbon monarchy and the separation of the Low Countries as an independent kingdom) and set Castlereagh free to play a commanding and mediatory role at the peace conference at Vienna. His main European objectives were to prevent the aggrandizement of Russia and to strengthen the weak central European areas of Germany and Italy. He and Metternich, the Austrian minister for foreign affairs, dominated the inner negotiations, though it was Castlereagh who took the lead in resisting the territorial demands of Russia and Prussia. The final settlement, with some compromises, was a practical embodiment of his principle of the "just equilibrium."

Castlereagh also attached fundamental importance to regular consultation by the great powers on matters of common concern; and the peace treaty contained specific provision for periodic meetings of the contracting parties. Though the practice of holding such meetings became known as the "congress system," Castlereagh's aim was to make possible diplomacy by conference rather than to establish any system of international regulation or interference in the internal affairs of other states. The distinction became increasingly apparent in the remaining seven years of his career. The Congress of Aix-la-Chapelle in 1818 readmitted France to the concert of powers. Castlereagh firmly resisted, however, a Russian attempt to institute a league of European powers to guarantee the existing order under sanction of military force. When the liberal movement in Germany after 1818 and the revolutions in Spain and in the Kingdom of the Two Sicilies in 1820 brought Austria and Russia closer together, he refused to treat

their meeting at Troppau in October 1820 as a full European congress, and after the Congress of Laibach (1821) he openly repudiated the Troppau principle of intervention and coercion. His classic state paper of May 1820 emphasized the difference between the despotic states of eastern Europe and the constitutional structures of Britain and France and made it clear that the British government could only act on the expediency of any given issue and within the limits of its parliamentary system. With the emergence in 1821 of the questions of Greek independence and the fate of the Spanish colonies, however, British political and commercial interests became directly affected, and Castlereagh decided to attend in person the Congress of Verona in 1822. The instructions he drew up for himself showed plainly that he would not sanction forcible interference in either Greece or Spain and that Britain would ultimately be prepared to recognize de facto governments resulting from successful revolutions. It is clear that Castlereagh was preparing for that detachment of Britain from the reactionary policy of the continental powers that was accomplished after his death.

This development was largely hidden from the British public by the personal nature of Castlereagh's diplomacy and his aloofness from public opinion. His apparent involvement with the eastern autocracies was disliked at home, and his role as spokesman for the government in the violent domestic politics of the postwar era kept him in a position of unpopular prominence. As leader of the House of Commons he was identified with the repressive policies of the years 1815-19 and with the Cabinet's unsuccessful introduction in 1820 of a bill to dissolve George IV's marriage with Queen Caroline. He was savagely attacked by such liberal Romantics as Lord Byron, Thomas Moore, and Shelley. After the abortive Thistlewood plot to assassinate the Cabinet in 1820, he always carried pistols in self-defense, and during the trial of Queen Caroline he was obliged to take up his residence in the Foreign Office for greater safety. The burden imposed on him by the royal divorce affair of 1820, in addition to his duties at the Foreign Office and in the House of Commons, probably hastened his final collapse. In 1821 he showed signs of abnormal suspiciousness, which by 1822 became outright paranoia. He was, or thought he was, being blackmailed on charges of homosexual acts, and on Aug. 12, 1822, he committed suicide shortly before he was due to set out for Verona. (N.G.)

BIBLIOGRAPHY. H. Montgomery Hyde, *The Rise of Castlereagh* (1933), is a fine account of Castlereagh. The *Memoirs and Correspondence of Viscount Castlereagh, Second Marquess of Londonderry*, ed. by Charles Vane, 12 vol. (1850-53), correspondence from Castlereagh to members of his family, provides source documents for historians.

Castletown, town district and ancient capital of the Isle of Man, one of the British Isles, on Castletown Bay, which is formed by the River Silver Burn. Castle Rushen, perhaps founded in 947-960 by Godred the Dane, is essentially Norman, largely rebuilt in the 14th century, with 16th-century additions. It was the residence of the lords of Man until the 18th century. The massive, square keep, or strongest part, is surrounded by an outer wall with towers and moat. Nearby is the old House of Keys, seat of the Manx parliament until its removal to Douglas in 1862. King William College (endowed 1668) is 1 mi northeast. Beyond Derby Haven is the Isle of Man Airport on Ronaldsway. Tourist attractions include a nautical museum and the Witches Mill museum of witchcraft. Pop. (1996) 2,958.

Castor, also called ALPHA GEMINORUM, multiple star having at least six component stars, in the zodiacal constellation Gemini. The stars Castor and Pollux are named for the twins of Greek mythology. Castor's combined apparent visual magnitude is 1.58. It appears as a bright visual binary, of which both members are spectroscopic binaries. An additional two component stars form an eclipsing binary system of red dwarfs revolving around each other in less than a day and orbiting the four main stars in a period of millions of years.

Castor and Pollux (Roman deities): see Dioscuri.

castor oil, also called RICINUS OIL, non-volatile fatty oil obtained from the seeds of the castor bean, *Ricinus communis*, of the spurge family (Euphorbiaceae). It is used in the production of synthetic resins, plastics, fibres, paints, varnishes, and various chemicals including drying oils and plasticizers. Castor oil is viscous, has a clear and colourless to amber or greenish appearance, a faint characteristic odour, and a bland but slightly acrid taste, with a usually nauseating aftertaste.

Castor oil is obtained from castor beans either by pressing or by solvent extraction. Both beans and oil are produced principally by India and Brazil and consumed primarily in the United States, largely in industry.

In addition to the uses mentioned previously, castor oil and its derivatives are used in cosmetics, hair oils, fungistatic (fungus-growth-inhibiting) compounds, embalming fluid, printing inks, soap, lubricants, greases and hydraulic fluids, dyeing aids, and textile finishing materials. Turkey-red oil, long used as a dyeing aid, is produced by the reaction of castor oil with sulfuric acid.

Castor oil consists almost entirely of the triglycerides ricinoleic acid; and although castor oil has been taken internally as a cathartic, its use can be harmful.

castor-oil plant (*Ricinus communis*), large plant, of the spurge family (Euphorbiaceae),

grown commercially for the pharmaceutical and industrial uses of its oil and for use in landscaping because of its handsome, giant, 12-lobed, palmate (fanlike) leaves. The bristly, spined, bronze-to-red clusters of fruits are attractive but often are removed before they mature because of the poison ricin concentrated in their mottled, beanlike seeds. Probably native to Africa, this species has become naturalized throughout the tropical world. The plants are chiefly cultivated in India and Brazil, largely for their oil. In the tropics the plants reach about 10 to 13 m (30 to 40 feet) in height. In temperate climates they are raised as annuals and grow 1.5 to 2.4 m in

a single season. Although *R. communis* is the only species in its genus, there are hundreds of natural forms and many horticultural varieties.

Castoroides, extinct genus of giant beavers found as fossils in Pleistocene deposits in North America (the Pleistocene Epoch began 1,600,000 years ago and ended 10,000 years ago). *Castoroides* attained a length of about

2.5 m (7.5 feet). The skull was large and the gnawing teeth strongly developed. In Europe, a similar form of giant beaver, *Trogotherium*, paralleled the development of *Castoroides*.

Castracani, Castruccio (b. 1281, Castruccio, Tuscany [Italy]—d. Sept. 3, 1328, Lucca), condottiere, or captain of mercenaries, who ruled Lucca from 1316 to 1328.

When the Guefs gained power in Lucca in 1300, Castruccio's family, the wealthy Antelminelli, were exiled from Lucca. Castruccio served successively as condottiere for the French, the English, and the Lombards. When the German king Henry VII entered Italy to be crowned Holy Roman emperor, Castruccio supported him by allying himself with the powerful Uguccione della Faggiuola, lord of Pisa, and led the pro-imperial Ghibelline forces back to Lucca (1314), over which Uguccione was given power. The rivalry between the two leaders was settled when Uguccione was overthrown in 1316, and the victorious Castruccio was made lord and protector of Lucca.

In 1320 the emperor Frederick III appointed Castruccio imperial vicar of Lucca, Versilia, and Lunigiana. When the emperor Louis IV entered Italy to be crowned in Rome, Castruccio became one of his most active counselors. In 1324 Louis appointed him count of Lattin, duke of Lucca, with rights of succession for his heirs, and senator—i.e., governor—of Rome. His victory over the Florentines at Altopascio in 1325 brought almost all Tuscany under his sway, and he became one of the most powerful men in Italy.

Castruccio's long fight against the papalists Guefs brought him, however, into conflict

with the papacy, and he was twice excommunicated by John XXII (pope from 1316 to 1334). Castruccio's sudden death, in 1328, left his empire disorganized, an easy prey for the Florentines, who soon recaptured most of his holdings.

castrato, also called EVIRATO, male soprano or contralto voice of great range, flexibility, and power, produced as a result of castration before puberty. The castrato voice was introduced in the 16th century, when women were banned from church choirs and the stage. It reached its greatest prominence in 17th- and 18th-century opera. The practice of castration, illegal and inhumane, produced an adult voice of extraordinary power attributable to the greater lung capacity and physical bulk of the adult male.

The unique tone quality of the voice, coupled with the ability of the intensively trained singers to execute extremely difficult florid vocal passages, made the castrati the rage of opera audiences and contributed to the spread of Italian opera. In 18th-century opera the majority of male singers were castrati. The most famous of the Italian castrati was Carlo Broschi, known as Farinelli.

Castrén, Matthias Alexander (b. Dec. 2, 1813, Tervola, Fin., Russian Empire—d. May 7, 1852, Helsinki), Finnish nationalist and pioneer in the study of remote Arctic and Siberian Uralic and Altaic languages. He also championed the ideology of Pan-Turanism—the belief in the racial unity and future greatness of the Ural-Altaic peoples.

After many years of field research in Siberia, Castrén made important contributions to the study of the lesser-known Uralic, Altaic, and Paleo-Siberian languages. He further concluded that the Finns originated in Central Asia and that, far from being a small, isolated people, they were part of a larger polity that included such groups as the Magyars, the Turks, and the Mongols. This belief was accepted by the Finnish nationalists after Castrén, himself a zealous nationalist, made his views public in 1849 and lent great impetus to the advancement of Finnish language study in Finland. Castrén occupied the first chair in Finnish at the University of Helsinki (1851) and became university chancellor the following year. His most significant and lasting contribution is his detailed analysis of individual Samoyedic languages, which provided the first sound comparative basis for uniting the Finno-Ugric and Samoyedic languages into a common Uralic family.

Castres, town, Tarn département, Midi-Pyrénées région, southern France, on the Agout River, east of Toulouse. The site of a Gallo-Roman camp, the town developed around a Benedictine monastery that was

The Musée Goya-Jaurès and gardens on the Agout River, Castres, Fr.; the cathedral is in the background

Club Ins

founded about 647. Guy de Montfort, brother of Simon de Montfort, handed down the seigneurie in the 13th century; but from the mid-16th century the town embraced the Protestant Reformation, and historians even styled it a Protestant republic. Louis XIII subdued Castres, which later suffered economically when leading Protestants fled the country at the revocation of the Edict of Nantes (1685). Under Louis XIV, Castres once again became prosperous; the town hall (designed by Jules Hardouin-Mansart), Baroque churches, and other public buildings are legacies of this flourishing period. The textile industry has thrived in the town since the 13th century. Castres machine tools have a world market, and pharmaceuticals are produced there as well. Pop. (1999) 45,413.

Castres, Jacques d'Armagnac, Count (comte) **de:** see Nemours, Jacques d'Armagnac, duke **de.**

Castries, chief town of Saint Lucia island in the eastern Caribbean Sea, lying 40 miles (65 km) south of Fort-de-France, Martinique. Its fine landlocked deepwater harbour on the northwestern coast is Saint Lucia's chief port, shipping mainly bananas but also exporting sugarcane, rum, molasses, cacao, coconuts, copra, limes and lime juice, essential oils, bay

Castries and its harbour on Saint Lucia

rum, and various tropical fruits and vegetables. A fortress on Mount Fortune (852 feet [260 m]) overlooks the town. There is a botanical station, and Vigie Beach and an airport are nearby. Pop. (1999 est.) 57,000.

Castriota, George: see Skanderbeg.

Castro, town, Chiloé *provincia*, southern Chile. It lies 45 miles (72 km) south of the town of Ancud, on the east coast of Chiloé Island. Castro was founded in 1567 and regrew after being destroyed by an earthquake in 1837. It is a port and agricultural centre (potatoes, wheat, livestock) and also has a timber industry and sawmills. Pop. (2002 prelim.) 39,073.

Castro, Américo, in full AMÉRICO CASTRO Y QUESADA (b. May 4, 1885, Cantagallo, Brazil—d. July 25, 1972, Lloret de Mar, Spain), Spanish philologist and cultural historian who explored the distinctive cultural roots of Spain and Spanish America.

Castro was born in Brazil of Spanish parents, who returned with him to Spain in 1890. He graduated from the University of Granada in 1904 and studied at the Sorbonne in Paris (1905–07). In 1910 he organized the Centre for Historical Studies in Madrid, serving as the head of its department of lexicography. He remained at the centre, even after becoming professor at the University of Madrid in 1915. Castro published several scholarly works, notably *Vida de Lope de Vega* (1919; "Life of Lope de Vega"), *Lengua, enseñanza*

y literatura (1924; "Language, Teaching, and Literature"), and *El pensamiento de Cervantes* (1925; "The Thought of Cervantes"), and also lectured abroad. In Berlin in 1931, when the Spanish Republic was declared, he became its first ambassador there. He went to the United States when the Spanish Civil War broke out in 1936 and there taught literature at the University of Wisconsin (1937–39), the University of Texas (1939–40), and Princeton University (1940–53).

Castro believed that Spaniards became a distinct group, with a sense of *ipsidad* ("selfhood"), only after the Moorish conquest, when they became a Christian caste in a society marked by the coexistence of Christians, Moors, and Jews—an explanation of later attitudes that he treated in his *Iberoamérica, su presente y su pasada* (1941; "Ibero-America, Its Present and Its Past"), *España y su historia* (1948; "Spain and Its History"), and *De la edad conflictiva* (1961; "Out of the State of Conflict").

Castro, Cipriano (b. Oct. 14, 1858, Capacho, Táchira, Venezuela—d. Dec. 4, 1924, San Juan, Puerto Rico), Venezuelan soldier and dictator, called the Lion of the Andes, who was the first man from the mountains to rule a nation that until the 20th century had been dominated by plainsmen and city dwellers from Caracas. He ruled for nine remarkably corrupt years (1899–1908), embezzling vast

sums of money and living as an extraordinary libertine, only to be deposed by his more ruthless lieutenant, Juan Vicente Gómez.

Receiving no formal education, Castro worked as a cowboy in the Andean region. Enlisting the support of a powerful Venezuelan general, he entered politics and became the governor of his province of Táchira but was exiled to Colombia when the government in Caracas was overthrown in 1892. He lived in Colombia for seven years, amassing a fortune in illegal cattle trading and recruiting a private army, with which he successfully attacked Caracas in 1899. Installed as the supreme military commander and later as president of Venezuela, Castro inaugurated a period of plunder and political disorder.

Castro's rule was marked by frequent rebellions, the murder or exile of his opponents, his own extravagant living, and trouble with other nations. When he refused to make payments on foreign debts, British, German, and Italian ships set up a blockade in 1902 to force payment. The issue was eventually resolved through arbitration.

Seriously ill and exhausted by his excesses, he left for Paris in 1908 to seek medical aid, leaving the government in the hands of his lieutenant Gómez, the man who was instrumental in his victory of 1899. Gómez seized the government for himself, and Castro remained an exile for the last 16 years of his life, mostly in Puerto Rico, unsuccessfully plotting his return to Venezuela.

Castro, Eugénio de (b. March 4, 1869, Coimbra, Port.—d. Aug. 17, 1944, Coimbra), leading Portuguese Symbolist and Decadent poet.

Castro's best-known collection of poetry, *Oaristos* (1890; "Intimate Chats"), launched Symbolism in Portugal. His Symbolism maintains the essential doctrines of the French theorists of the movement, in contrast with the nostalgic nationalism that characterized the poetry of his contemporaries in Portugal. Among his numerous published collections, the best known include *Horas* (1891; "Hours"), *Sagramon* (1895), *Salomé e Outros Poemas* (1896; "Salomé and Other Poems"), *Saudades do Céu* (1899; "Longings for Heaven"), and *Constança* (1900), a sensitive interpretation of the personal drama of the wife of Peter I, whose mistress, Inês de Castro, figures prominently in Portuguese history and literature.

Castro, Fidel, in full FIDEL CASTRO RUZ (b. Aug. 13, 1926/27, near Birán, Cuba), political leader of Cuba (from 1959) who transformed his country into the first communist state in the Western Hemisphere. Castro became a symbol of communist revolution in Latin America. He held the title of premier until 1976, when he became president of the Council of State and the Council of Ministers.

Castro was born in the Mayarí municipality of what was then Oriente province, the easternmost in Cuba. His father, Angel Castro y Argiz, an immigrant from Spain, was a fairly prosperous sugarcane farmer in a locality that had long been dominated by estates of the American-owned United Fruit Company. Angel Castro had two children by his first wife and five more children by his cook, Lina Ruz González. Fidel was one of these five children, and Raúl, who later became his brother's chief associate in Cuban affairs, was another.

Fidel Castro attended Roman Catholic boarding schools in Santiago de Cuba, Oriente province, and then the Catholic high school Belén in Havana, where he proved an outstanding athlete. He entered the School of Law of the University of Havana in 1945 and graduated in five years. Castro's main activity at the university—where organized violent gangs sought to advance a mixture of romantic goals, political aims, and personal careers—was politics. In 1947 he joined an abortive attempt by Dominican exiles and Cubans to invade the Dominican Republic and overthrow Generalissimo Rafael Trujillo. He took part in urban riots that broke out in Bogotá, Colombia, in April 1948.

Fidel Castro, 1964
Elliott Erwitt—Magnum

After his graduation in 1950, Castro began to practice law and became a member of the reformist Cuban People's Party (called Ortodoxos). He became their candidate for a seat in the House of Representatives (from a Havana district) in the elections scheduled for June 1952. In March of that year, however, the former Cuban president, General Fulgenio Batista, overthrew the government of Pres-

ident Carlos Prío Socarrás and canceled the elections.

After legal means failed to dislodge Batista's new dictatorship, Castro began to organize a rebel force for the task in 1953. On July 26, 1953, he led about 160 men in a suicidal attack on the Moncada military barracks in Santiago de Cuba in hopes of sparking a popular uprising. Most of the men were killed and Castro himself was arrested. After a trial in which he conducted an impassioned defense, he was sentenced by the government to 15 years' imprisonment. He and his brother Raúl were released in a political amnesty in 1955, and they went to Mexico to continue their campaign against the Batista regime. There Castro organized Cuban exiles into a revolutionary group called the 26th of July Movement.

On Dec. 2, 1956, Castro and an armed expedition of 81 men landed on the coast of Oriente province, Cuba, from the yacht *Granma*. All of them were killed or captured except for Castro, Raúl, Ernesto (Che) Guevara, and nine others, who retreated into the Sierra Maestra of southwestern Oriente province to wage guerrilla warfare against the Batista forces. With the help of growing numbers of revolutionary volunteers throughout the island, Castro's forces won a string of victories over the Batista government's demoralized and poorly led armed forces. Castro's propaganda efforts proved particularly effective, and as internal political support waned and military defeats multiplied, Batista fled the country early on Jan. 1, 1959. Castro's force of 800 guerrillas had defeated the Cuban government's 30,000-man professional army.

As the undisputed revolutionary leader, Castro became commander in chief of the armed forces in Cuba's new provisional government, which had Manuel Urrutia, a moderate liberal, as its president. In February 1959 Castro became premier and thus head of the government. By the time Urrutia was forced to resign in July 1959, Castro had taken effective political power into his own hands.

Castro had come to power with the support of most Cuban city dwellers on the basis of his promises to restore the 1940 constitution, create an honest administration, reinstate full civil and political liberties, and undertake moderate reforms. But once established as Cuba's leader he began to pursue more radical policies: Cuba's private commerce and industry were nationalized; sweeping land reforms were instituted; and American businesses and agricultural estates were expropriated. The United States was alienated by these policies and offended by Castro's fiery new anti-American rhetoric, and a trade agreement he made with the Soviet Union in February 1960 further deepened American distrust. In 1960 most economic ties between Cuba and the United States were severed, and the United States broke diplomatic relations with Cuba in January 1961. In April of that year the U.S. government secretly equipped thousands of Cuban exiles to overthrow Castro's government; their landing at the Bay of Pigs in April 1961, however, was crushed by Castro's armed forces.

Cuba also began acquiring weapons from the Soviet Union, which soon became the island nation's chief supporter and trade partner. In 1962 the Soviet Union secretly stationed ballistic missiles in Cuba that could deliver nuclear warheads to American cities, and in the ensuing confrontation with the United States, the world came close to nuclear war. The Cuban Missile Crisis ended when the Soviet Union agreed to withdraw its nuclear weapons from Cuba in exchange for a pledge that the United States would no longer seek to overthrow Castro's regime.

In the meantime Castro created a one-party government to exercise dictatorial control over all aspects of Cuba's political, economic, and

cultural life. All political dissent and opposition were ruthlessly suppressed. Many members of the Cuban upper and middle classes felt betrayed by these measures and chose to emigrate to the United States. At the same time, Castro vastly expanded the country's social services, extending them to all classes of society on an equal basis. Educational and health services were made available to Cubans free of charge, and every citizen was guaranteed employment. The Cuban economy under the Castro regime, however, failed to achieve significant growth or to reduce its dependence on the country's chief export, cane sugar. Economic decision-making power was concentrated in a centralized bureaucracy headed by Castro, who proved to be an inept economic manager. With inefficient industries and a stagnant agriculture, Cuba became increasingly dependent on favourable Soviet trade policies to maintain its modest standard of living in the face of the United States' continuing trade embargo.

Castro remained premier until 1976, when a new constitution created a National Assembly and Castro became president of that body's State Council. He retained the posts of commander in chief of the armed forces and secretary-general of the Communist Party of Cuba—the only legal political party—and he continued to exercise unquestioned and total control over the government. Castro's brother Raúl, minister of the armed forces, ranked second to him in all government and party posts.

Castro's early attempts to foment Marxist revolutions elsewhere in Latin America foundered, but Cuban troops did eventually serve as proxies for the Soviet Union in various Third World conflicts. From 1975 to 1989 Cuban expeditionary forces fought in the Angolan civil war on the side of the communistic Popular Movement for the Liberation of Angola. In 1978 Cuban troops assisted Ethiopia in defeating an invasion by Somalia. In the 1980s Castro emerged as one of the leaders of the Third World and the nonaligned nations, despite his obvious ties to the Soviet Union. He continued to signify his willingness to renew diplomatic relations with the United States if that nation ended its trade embargo against Cuba.

In the late 1980s, when the Soviet Union under Mikhail Gorbachev began to undertake democratic reforms and eastern European countries were allowed to slip out of the Soviet orbit, Castro retained a hard-line stance, espousing the discipline of communism. The collapse of the Soviet Union in 1991 took him by surprise and meant the end of generous Soviet subsidies to Cuba. Castro countered the resulting economic decline and shortages of consumer goods by allowing some economic liberalization and free-market activities while his government retained tight controls over the country's political life.

Castro, Inês de (b. 1323?—d. Jan. 7, 1355, Coimbra, Port.), mistress, before his accession, of Peter (Pedro) I of Portugal. She was famous because of her tragic death, which was related by such writers and poets as Luís de Camões, Luís Vêlez de Guevara, and Henri de Montherlant.

The illegitimate daughter of Pedro Fernández de Castro, a Galician noble, she went to Portugal about 1340 with her cousin Constanza, who shortly afterward married King Afonso IV's eldest son and heir, Peter (the future Peter I). But Peter was soon attracted to the beautiful Inês, and a violent passion sprang up between them. After the death of Constanza (1345), they lived together and had

several children. However, the influence of Inês and her two brothers over Peter aroused hostility at court, and, when in 1354 Peter declared himself pretender to the throne of Castile, Afonso IV decided to have Inês executed. On Jan. 7, 1355, after a dramatic interview at Coimbra, the king abandoned her to the assassins.

After Peter's accession (1357), her body was moved to a magnificent mausoleum in the abbey church at Alcobça. Legend has it that the king caused the corpse to be crowned and made the courtiers kiss the hand of the dead Inês.

Castro, João de (b. Feb. 7, 1500, Lisbon, Port.—d. June 6, 1548, Goa, Portuguese India), naval officer who helped preserve the Portuguese commercial settlement in India and contributed to the science of navigation with three *roteiros* (pilot books). He was also the first to note the deviation of the ship's compass needle created by the magnetic effect of iron objects.

The son of Alvaro de Castro, governor of Lisbon, and a student of the celebrated Portuguese mathematician and geographer Pedro Nunes, he spent 20 years in North Africa before sailing to western India in 1538. There he helped to end the Ottoman-Indian siege of the Portuguese fort at Diu. He sailed up the Red Sea to Suez (1540–41) and returned to Portugal in 1543. In 1545 he commanded the Portuguese fleet that helped end another siege of Diu. He served as viceroy of Portuguese India for only a few months before his death in the arms of the missionary St. Francis Xavier. Castro's pilot books, remarkable for their scientific observations, were published in Paris, France (1833), and in Oporto (1843) and Lisbon, Port. (1882).

Castro, Rosalía de (b. February 1837, Santiago de Compostela, Spain—d. July 15, 1885, Padrón, near Santiago), the most outstanding modern writer in the Galician language, whose work is of both regional and universal significance.

In 1858 Castro married the historian Manuel Murguía (1833–1923), a champion of the Galician Renaissance. Although she was the author of a number of novels, she is best known for her poetry, contained in *Cantares gallegos* (1863; "Galician Songs") and *Follas novas* (1880; "New Medleys"), both written in her own language, and *En las orillas del Sar* (1884; *Beside the River Sar*), written in Castilian. Part of her work (the *Cantares* and some of the poems in *Follas novas*) expresses with sympathetic power the spirit of the Galician people—their gaiety, their wisdom and folklore, their resentment of Castilian domination, their love of their homeland, and the sorrows of poverty and emigration. About 1867, however, Castro began to write more personally, describing in verse her own deepest feelings—remorse, repressed desire, the anguish of living, the desolation of spiritual loneliness, fear of death, the transience of affection, the feeling that everything is in vain. Her complete works appeared in 1973.

Castro Alves, António de (b. March 14, 1847, Muritiba, Brazil—d. July 6, 1871, Salvador), Romantic poet whose sympathy for the Brazilian abolitionist cause won him the name "poet of the slaves."

While still a student Castro Alves produced a play that brought him to the attention of José de Alencar and Joaquim Maria Machado de Assis, Brazilian literary leaders. Having studied for the law, he soon became a dominant figure among the Condoreira (Condor) school of poets, likened, for their dedication to lofty causes and for their preference for elevated style, to the highest

flying birds in the Americas. His romantic image was heightened by his sense of being foredoomed by a wound incurred in a hunting accident. He lived and wrote at fever pitch while the wound worsened and eventually led to amputation of his foot. Tuberculosis set in, and he died at 24. *Espumas Flutuantes* (1870; "Floating Foam") contains some of his finest love lyrics. "A Cachoeira de Paulo Afonso" (1876; "The Paulo Afonso Falls"), a fragment of *Os Escravos*, tells the story of a slave girl who is raped by her master's son. This and Castro Alves' other abolitionist poems were collected in a posthumous book, *Os Escravos* (1882; "The Slaves").

Castro y Bellvis, Guillén de (b. 1569, Valencia, Spain—d. July 28, 1631, Madrid), the most important and representative of a group of Spanish dramatists that flourished in Valencia. He is remembered chiefly for his work *Las mocedades del Cid* (1599?), upon which the French playwright Pierre Corneille based his famous drama *Le Cid* (1637). Castro's play clearly shows his strength in the use of natural dialogue. After an active military and civil service career in Valencia and Italy, he settled in Madrid, where his friend the playwright Lope de Vega helped him to find outlets for his work. Castro is considered the first playwright to have dealt with the seamier aspects of marriage, as in *Los mal casados de Valencia* ("The Unhappy Marriages of Valencia"). Attracted to the culture of Castile, he drew heavily upon the traditional ballads of the region, and three of his plays are based upon novels by Miguel de Cervantes. A haughty man, he antagonized his patrons and lived his last years in penury.

Castrop-Rauxel, city, North Rhine-Westphalia Land (state), northwestern Germany, near the Rhine-Herne Canal, in the eastern part of the Ruhr industrial district. Castrop, which was first mentioned in 834, was chartered in 1484. It belonged to the duchy of Cleves- (Kleve-) Mark until 1609, when it came under Prussian rule. It amalgamated with 12 country districts (including Rauxel) to form Castrop-Rauxel in 1926. Historic buildings in the city include the moated castle of Bladenhorst and Goldschmieding House, both dating from the 16th century, and the 13th-century Church of St. Lambert. Principal industries are coal mining and chemical works. Other products include textiles, armatures, and handicrafts. The town has extensive open spaces, including a racecourse. Pop. (1989 est.) 77,660.

casualty insurance, provision against loss to persons and property, covering legal hazards as well as those of accident and sickness. Major classes of casualty insurance include liability, theft, aviation, worker's compensation, credit, and title.

Liability insurance contracts may cover liability arising out of the use of an automobile, the operation of a business, professional negligence (malpractice insurance), or the ownership of property. The insurer agrees to pay on behalf of the insured all sums that the insured becomes legally obligated to pay as damages. The insurer also agrees to conduct a court defense of the insured.

Theft-insurance contracts cover losses from burglary, robbery, and other theft. Aviation insurance usually covers physical damage to the aircraft and legal liability arising out of its ownership and operation. Worker's compensation insurance, financed by employers' contributions, compensates workers for losses suffered as a result of work-related injuries; compensation may include medical benefits, temporary incapacity benefits, permanent disability benefits, and, in an increasing number of countries, retraining benefits.

The numerous forms of credit insurance include coverage of the risk of bad debts from insolvency, death, and disability; the risk of loss of savings from bank failure; and the risk of loss of export credit from commercial or political causes. Title insurance guarantees the purchaser of real estate against loss from undiscovered defects in the title to property purchased.

casuariiform (order Casuariiformes), any of a group of large, flightless birds that includes the cassowary (*Casuaris*) and the emu (*Dromaius novaehollandiae*) as well as several extinct birds known only by fossil evidence.

A brief treatment of casuariiforms follows. For full treatment, see MACROPAEDIA: Birds.

The emu was not seen by Europeans until 1788, more than a century after the first cassowaries had been seen by Europeans. At that time there were four living species of emu, but the Kangaroo Island, King Island, and Tasmanian emus were exterminated shortly after colonization of their respective islands.

The emu, a native of Australia, is the world's second largest bird; only the ostrich (*Struthio camelus*) is larger. Very large emus can reach 55 kg (120 pounds), although the average weight for males is 35 kg and for the females 40 kg. They may stand up to 1.8 m (6 feet) in height. The three species of cassowary, found only in northern Australia, New Guinea, and adjacent islands, are the Australian, or double-wattled, cassowary (*C. casuaris*), the single-wattled cassowary (*C. unappendiculatus*), and the dwarf cassowary (*C. bennetti*).

All the casuariiforms are running (cursorial) birds and show various adaptations to this life-style. As in many cursorial birds, the hind toe has disappeared and the birds move on three sturdy front toes. On the inner toe of the cassowary the claw has evolved into a long, spurlike structure, quite effective when the cassowary defends itself by kicking. Emus and cassowaries are good swimmers as well as fast runners.

The plumage of the casuariiforms has a hair-like look different from that of most birds, because the feathers lack the barbules that interlock to create the wide flat surface of most bird feathers. These feathers are less likely to become damaged or tangled in the dense, thorny underbrush that most casuariiforms inhabit. There is no differentiated tail. The plumage of the emu is brown, while that of the cassowaries is black. In addition, the cassowaries have a flattened horny helmet or casque on the head; this is believed to protect the bird from injury while running through dense forests. The casque may reach 15 cm (6 inches) in *C. casuaris*. Bright red or orange fleshy wattles on the head and neck are characteristic of *C. casuaris* and *C. unappendiculatus*.

Cassowaries are solely rain forest inhabitants

while emus are found in a wide variety of habitats, in arid scrub country and open plains as well as in forested areas. Members of this order eat mostly vegetation, including leaves, fruits, and seeds, but emus are known to feed on insects such as grasshoppers when these are abundant.

Cassowary clutches range from 3 to 8 eggs; those of the emu are larger, averaging 9 and sometimes reaching 16 eggs. The greenish eggs are about 13 cm long and weigh between 450 and 800 g (16 and 28 ounces). The incubation period lasts 58 to 61 days for the emu and 49 to 52 days for the cassowaries. Unlike most bird species, only the male incubates the egg in the casuariiforms. When the chicks hatch they are patterned with alternating dark and light longitudinal stripes. They mature in about two years. Cassowaries live year-round in pairs or family parties. During the nonbreeding season emus may gather in large flocks and sometimes travel long distances.

These birds have long been important as food to the native peoples of the Australasian region. Cassowary chicks are frequently captured and raised in a pen until they are large enough to eat. The plumage of these birds is used for personal decoration, particularly the feathers of the emu.

The emu is much less common than formerly throughout much of its range, but in western Australia it is still abundant. It is an agricultural pest around wheat farms, where it breaks fences and crushes and eats the crop. Western Australia pays a bounty on emus, and between 5,000 and 40,000 of the birds are taken each year.

Casuarinales, the beefwood order of dicotyledonous flowering plants comprising the family Casuarinaceae, with two genera (*Casuarina*, 30 species; *Gymnostoma*, 20 species) of trees and shrubs, many of which have a distinctly pinelike aspect when seen from afar. They are naturally distributed in tropical eastern Africa, the Mascarene Islands, Southeast Asia, Malaysia, Australia, and Polynesia. Some, especially the beefwood (*C. equisetifolia*, also called she-oak, ironwood, Australian pine, whistling pine, or swamp oak), also are used ornamentally in warm-climate countries, where they have often escaped cultivation and become established in the wild.

The plants are characterized by slender, green, often drooping branches that are deeply grooved and that bear, at intervals, whorls of tiny, scalelike leaves. Long plant hairs that protrude from the grooves are thought to function as protective structures for the stomates (microscopic pores to the internal tissues), which are located along the side walls of the grooves. These structural features serve as adaptations to the dry conditions of the coastal strands and poor soils where these plants often grow. The structurally reduced flowers are separately

Beefwood (*Casuarina equisetifolia*) showing (left) form and (right) leaves and fruit
(Left) Walter Chandoha, (right) E.R. Degginger

male and female; both sexes may occur on the same plant (monoecious condition) or on separate plants (dioecious condition). Male flowers occur in elongated, slender, erect clusters (catkins or spikes), usually at branchlet tips, and each consists of a single pollen-producing stamen, together with two small, scalelike floral leaves (sepals or bracts) and two smaller scalelike structures called bracteoles. The female flowers occur in dense globular clusters that become woody and conelike at maturity, the woody segments enclosing the seeds. Each female flower is a petalless, two-chambered structure (pistil) with two ovules, both in the same chamber. Two long style branches or stigmas extend from the upper end of the pistil beyond the flower cluster. Pollination is by wind.

Older classification systems held this group to be the most primitive of dicotyledonous plants, but the flowers and other primitive-appearing characteristics are now considered to be reduced rather than primitive. Several species of *Casuarina*, especially *C. equisetifolia*, are valued for their hard, dense, yellowish to reddish brown wood, which is strong and reputed to be resistant to termite attack.

cat (family FELIDAE), any of 37 species of carnivores that include, among others, the cheetah, cougar, jaguar, leopard, lion, lynx, tiger, and domestic cat. Cats are native to almost every region on Earth, with the exception of Australia and Antarctica. They are predatory mammals that live in a wide variety of habitats, but they are typically woodland animals.

A brief treatment of felids follows. For full treatment, see MACROPAEDIA: Mammal. For domestic cats, see MACROPAEDIA: Cats, Domestic.

Most cats are patterned with spots, stripes, or rosettes, but some, such as the cougar, or puma (*Puma concolor*), jaguarundi (*Heptailurus yagouaroundi*), and lion (*Panthera leo*), are uniform in colour. Black or nearly black coats occur in individuals of several species. Although bobcats and lynx (genus *Lynx*) have stubby tails, most cats have a long tail that makes up about a third of the animal's total length. The head is characterized by a short nose and round face, usually with short ears. Cat feet have sharp claws that are retractile except in the cheetah. In most felids the male is larger than the female.

Cats are noted for purring when content and for snarling, howling, or spitting when in conflict with another of their kind. The so-called "big cats" (genus *Panthera*), especially the lion, often roar, growl, or shriek. Usually, however, cats are silent. Many cats use "clawing trees," upon which they leave the marks of their claws as they stand and drag their front feet downward with the claws extended. The purpose of such behaviour is debatable, but the behaviour is innate.

The larger cats are strong, fierce, and extremely dangerous when hungry. Because of their large size, attacks on humans occasionally occur. Although tigers and leopards are most noted for man-eating, lions and jaguars can also be dangerous. In North America the cougar, or mountain lion, accounts for a few attacks annually.

The fur of some cats is in great demand, and some rare species that are hunted and trapped illegally are in danger of becoming extinct.

The cats are the most highly specialized of the flesh-eating mammals. They are powerfully built animals, so well-coordinated that they almost always land on their feet when they fall or are dropped. The brain is large and highly developed. In keeping with a carnivorous habit, the cat has a simple gut; the small intestine is only about three times the length of the body. The tongue in all cats has a patch of sharp, backward-directed spines near the tip, which has the appearance and feel of

a coarse file; these spines help the cat lap up liquids and groom itself.

The most characteristic and specialized features are in the teeth and claws. The teeth are adapted to three functions: stabbing (canines), anchoring (canines), and cutting (molars). Cats have no flat-crowned crushing teeth and thus cannot chew their food but instead cut it up. Some teeth are nonfunctional; most of the cheek teeth do not even meet when the mouth is closed. All cats (except the cheetah) have strong, sharp, retractile claws.

Although the lion, tiger, and cheetah are mainly terrestrial in habit, they are agile climbers, while the leopard, jaguar, and ocelot are very much at home in trees, where they bound from limb to limb and sometimes sleep. The larger cats range over large areas. Big cats in the wild often rove alone or with a companion; occasionally one may become a member of a family group, as among lions, where a pride may consist of as many as 37 individuals. These loosely bound groups lack the rigid dominance order found in dog and wolf packs.

Although most cats are night hunters, a few are more active during the day, like the cheetah. Typically solitary while hunting, a cat steals up on prey on padded feet and overwhelms it in a short, quick rush or leap. It can move very fast in a short dash but is not built for sustained speed. The cheetah generally is credited with being the speediest of mammals, capable of speeds of 100–110 km per hour (there are rare reports of even higher speeds); a cheetah may also pursue prey for a considerable distance, as much as 5.5 km.

Cats generally are nocturnal in habit. The retina of the cat's eye is made extra sensitive to light by a layer of guanine, which causes the eye to shine at night in a strong light. The cat's sense of smell, well-developed particularly in the adult, is crucial to its evaluation of food, so that a cat whose nasal passages become clogged in illness may appear to lose its appetite completely.

All cats are adapted by nature to be strict flesh eaters, an assumption made primarily on the basis of their alimentary tract and their dentition.

The disposition to cleanliness is well established among cats; they groom themselves with their rasplike tongues, preening at length after a meal. Cats differ in their reaction to water: the lion and the leopard are reluctant to enter it (they can swim when they must). House cats do not dislike water but react adversely to being chilled or doused with cold water. Nervous tail wagging is common to all cats, from the lion to the house cat; it is learned from the mother and is associated with early play, a prelude to adult habits of predation.

CAT, abbreviation of COMPUTERIZED AXIAL TOMOGRAPHY, a radiologic diagnostic technique used in medicine. See tomography.

catabolism, the sequences of enzyme-catalyzed reactions by which relatively large molecules in living cells are broken down, or degraded. Part of the chemical energy released during catabolic processes is conserved in the form of energy-rich compounds (e.g., adenosine triphosphate [ATP]).

Energy is released in three phases. In the first, such large molecules as those of proteins, polysaccharides, and lipids are broken down; small amounts of energy are released in the form of heat in these processes. In the second phase, the small molecules are oxidized, liberating chemical energy to form ATP as well as heat energy, to form one of the three compounds: acetate, oxaloacetate, or α -oxoglutarate. These are oxidized to carbon dioxide during the third phase, a cyclic reaction sequence called the tricarboxylic acid (or Krebs) cycle. Hydrogen atoms or electrons from the intermediate compounds formed during the cycle are transferred (through a succession of

carrier molecules) ultimately to oxygen, forming water. These events, the most important means for generating ATP in cells, are known as terminal respiration and oxidative phosphorylation.

cataclastite, any rock produced by dynamic metamorphism during which faulting, granulation, and flowage may occur in previously crystalline parent rocks. When stress exceeds breaking strength, a rock yields by rupture. The rock may break as a unit, or individual minerals may be selectively granulated. The stress is generally not the same in all directions, so that movement in a preferred direction occurs, with slippage planes, granulation, or partial flowage being oriented preferentially. Some cataclastites are derived from igneous parent rocks, such as granite; in these, streaks of partially destroyed rock swirl around still-intact rock. Many cataclastites are derived from sedimentary rocks, including limestones and dolomites.

Mylonites are the products of extreme cataclastic deformation. The rocks are chemically unchanged but are ground to a powder by the movement of rock masses along a fault zone. They are extremely fine-grained, but mineral fragments of the parent rock can be seen under the microscope. Most mylonites are laminated, the layers formed by different grain sizes of crushed material.

Phyllonites are like mylonites in that they are fine-grained and are shaped by deformation, but in phyllonites there has been a reconstitution of the minerals. Some of the parent-rock minerals are re-formed with a different orientation, and new minerals are formed in response to the metamorphic conditions.

catacomb, Latin CATA-CUMBA, Italian CATA-COMBA, subterranean cemetery composed of galleries or passages with side recesses for tombs. The term, of unknown origin, seems to have been applied first to the subterranean cemetery under the Basilica of San Sebastiano (located on the Appian Way near Rome), which was reputed to have been the temporary resting place of the bodies of Saints Peter and Paul in the last half of the 3rd century. By extension, the word came to refer to all the subterranean cemeteries around Rome.

Uses. In the early Christian communities of the Roman Empire, catacombs served a variety of functions in addition to burial. Funeral feasts were celebrated in family vaults on the day of burial and on anniversaries. The Eucharist, which accompanied funerals in the

Catacomb of Domitilla in Rome showing a passage with side recesses for tombs

Fototeca Unione. American Academy in Rome

early Christian church, was celebrated there. In some catacombs, larger halls and connected suites of chapels were, in effect, shrines for devotions to saints and martyrs. A famous example is the Triclia in the catacomb of St. Sebastian, to which countless pilgrims came to partake of memorial meals (*refrigeria*) in honour of Saints Peter and Paul and to scratch prayers to them on the walls.

The catacombs also, because of their intricate layout and access by secret passages to sand quarries and open country, could be used as hiding places during times of persecution and civil commotion. Pope Sixtus II and four deacons, for example, are said to have been captured and killed in the catacomb of St. Sebastian during Valerian's persecution (AD 258); later, Christians took refuge there during the barbarian invasions.

There seems no truth in the widespread belief that early Christians used the catacombs as secret meeting places for worship. By the 3rd century AD there were more than 50,000 Christians in Rome, and 50,000 persons could hardly go out to the catacombs every Sunday morning in secret. Furthermore, worship of any kind would seem out of the question in the long, narrow corridors of the catacombs, and even the largest of the tomb chambers, such as the Chapel of the Popes in the catacomb of St. Calixtus, hardly holds 40 persons. Finally, Christians and pagans alike regarded death as unclean, so that, while memorial meals or masses for the dead might be celebrated in the tombs on appropriate occasions, regular public worship in such a place would be unlikely.

Locations. Catacombs were by no means a Christian or an exclusively Roman invention. The custom of burying the dead in underground rock chambers goes far back into antiquity. Catacombs are found all over the Mediterranean world: in Malta, near the ancient capital of the island; in Sicily, near Taormina, Syracuse, and elsewhere; in Egypt, near Alexandria and Cairo; in Lebanon, near Sidon (now Şaydā); and at many places in Italy, especially around Naples and in ancient Etruria.

The early Christian catacombs of Rome are located in a rough circle about three miles from the centre of the city. About 40 chambers are known, and most are found near the main roads leading into the city. They are the most extensive of all known catacombs, and portions are open to visitors.

catafalque, ornate, often theatrical, usually movable funeral structure mounted on a stage to support a coffin for a lying-in-state. It is used for royalty and personages of distinction and is normally set up in a historic public hall, such as Westminster Hall, London, and the Capitol Rotunda in Washington, D.C. The reputation of the Spanish architect José Chur-

riquera, known for his exuberant and fantastic Baroque style, was established overnight in 1689 by his design for the catafalque for Queen Maria Louisa, first wife of Charles II. Certain European shrines of saints in which the body is visible are sometimes regarded as catafalques.

Catalan language, Catalan CATALÀ, Romance language spoken in eastern and north-eastern Spain, chiefly in Catalonia and Valencia. It is also spoken in the Roussillon region

Catalonia and Catalan-language areas

of France, in Andorra, and in the Balearic Isles. The official language of the kingdom of Aragon in the 12th century, Catalan has a literary tradition dating from that period. The earliest written materials date from the 12th century. In the late 20th century, as Catalonia achieved greater autonomy, Catalan revived as the principal language of politics and education, as well as of public life in general, in Catalonia.

There are two main dialect groups in modern Catalan: Occidental, subdivided into West Catalan and Valencian; and Oriental, subdivided into East Catalan, Balearic, and Roussillonais and including the dialect spoken in Alghero, Sardinia, where Catalan was introduced in the 14th century. These various dialects differ only in minor respects (details of pronunciation, vocabulary, and verb conjugation) and are easily mutually intelligible. The dialectal differences are not usually reflected in the written language.

Catalan is most closely related to the Occitan language of southern France and to Spanish, but it is clearly distinct from both. It differs from Spanish in the following characteristics: a lack of rising diphthongs (such as *ie* and *ue*, as in compare Catalan *be* and Spanish *bien* "well," Catalan *bo* and Spanish *bueno* "good") and an abundance of falling diphthongs (such as *eu*, *au*, *ou*, as in compare Catalan *peu* and Spanish *pie* "foot," Catalan *bou* and Spanish *buey* "ox"). Catalan also retains the sounds *j* (pronounced like French *j* or the *z* in English "azure"), *z*, *tj* (pronounced like English *j*), *tz*, and *x* (pronounced like English *sh*); none of these consonants occur in modern Spanish. Catalan stresses certain verbs on the root rather than on the infinitive ending, as in Spanish (Catalan *VENdre*, Spanish *venDER* "to sell"). Catalan differs from Occitan less than from Spanish but often uses different vowel sounds and diphthongs and also has somewhat different grammatical conventions.

Catalan literature, the body of literature written in the Catalan language, prominent from the 13th to the 16th century and then revived in the 19th and 20th centuries.

A brief treatment of Catalan literature follows. For full treatment, see MACROPAEDIA: Spanish literature.

The oldest extant text in Catalan is the *Homilies d'Organyà*, a collection of sermons dating from the 12th or early 13th century but now appreciated more for their linguistic than for their literary value. Early kings of Aragon and

counts of Barcelona patronized troubadours imported from Provence and composing in the Occitan language, but by the 15th century the foreign influence had been fully thrown off, and a vigorous period of purely Catalan poetry emerged, climaxing in the verses of Ausiàs March and Jaume Roig. Johan Roïç de Corella, of Valencia, was perhaps the finest Catalan poet of the Renaissance. Catalan prose during the Middle Ages was represented in Christian speculations and in histories and chronicles.

From the 16th to the 18th century Catalan letters languished, eclipsed by Castilian Spanish, the language of the royal courts. In the 19th century, however, in a revival called the *Renaixença* (or *Renaixença*), Catalan literature flourished, inaugurated by such poets as Bonaventura Carles Aribau, Joaquim Rubió i Ors, Victor Balaguer, Jacintó Verdager Santaló, and especially Miguel Costa i Llobera. Essayists and dramatists also produced works of considerable originality. From the dictatorship of Miguel Primo de Rivera (1923–30) through the dictatorship of Francisco Franco (1939–75) Catalan was frequently suppressed, and only mild literary activity prevailed, mainly among Catalans in exile. An exuberant nationalism in the last quarter of the 20th century, however, was accompanied by a resurgence of Catalan literature in Catalonia and Majorca.

catalase, an enzyme that brings about (catalyzes) the reaction by which hydrogen peroxide is decomposed to water and oxygen. Found extensively in mammalian tissues, catalase prevents the accumulation of and protects the body tissues from damage by peroxide, which is continuously produced by numerous metabolic reactions.

Catalhöyük, major Neolithic site in the Middle East, located near Konya in south-central Turkey. Excavations (1961–65) by the British archaeologist James Mellaart have shown that Anatolia in Neolithic times was the centre of an advanced culture. The earliest building period at Catalhöyük is tentatively dated to about 6700 BC and the latest to about 5650 BC. The inhabitants lived in rectangular mud-brick houses probably entered from roof level, presumably by a wooden ladder. In addition to a hearth, and an oven, houses had platforms for sleeping, sitting, or working.

Edible grains and oil-producing seeds and nuts were extensively cultivated, and animal husbandry was probably practiced.

Excavation of the religious quarter produced a series of shrines with wall paintings of exceptional brilliance. These are of interest for their link with Upper Paleolithic art.

Catalina (Spanish personal name): see under Catherine.

Catalina Island (California, U.S.): see Santa Catalina Island.

Catalonia, Spanish CATALUÑA, Catalan CATALUNYA, *comunidad autónoma* ("autonomous community") and historic region of Spain encompassing the northeastern Spanish *provincias* of Gerona, Barcelona, Tarragona, and Lérida and established by the statute of autonomy of Dec. 18, 1979. The autonomous community of Catalonia, which has an area of 12,328 square miles (31,930 square km), is the richest and most highly industrialized part of Spain. The capital is Barcelona. Catalonia was formerly a principality of the crown of Aragon, and it has played an important role in the history of the Iberian Peninsula. From the 17th century it was the centre of a separatist movement that sometimes dominated Spanish affairs.

Catalonia was one of the first Roman possessions in Spain. Occupied during the 5th century AD by the Goths, it was taken by the Moors in 712 and at the end of the 8th century by Charlemagne, who incorporated it

into his realm as the Spanish March, ruled by a count. Frankish suzerainty over Catalonia was merely nominal, however, and was completely rejected during the reign of Count Borrell (d. 991).

From 1137, when Count Ramon Berenguer IV of Barcelona was betrothed to Petronila, queen of Aragon, Catalonia and Aragon were united under the same ruler. Catalonia monopolized trade in the western Mediterranean in the 13th and 14th centuries, and Catalan interests dominated the union with Aragon until 1410, when the male line of the counts of Barcelona became extinct. Dissatisfaction in Catalonia with the new Trastámara dynasty of Aragon increased after 1412; during the reign of John II it developed into a full-scale but unsuccessful rebellion (1462–72).

After the marriage of John II's son Ferdinand with Isabella of Castile (1469) had brought about the unification of Spain, Catalonia became of secondary importance in Spanish affairs. Though it retained its autonomy and Generalitat (assembly), by the 17th century its conflict of interest with Castile, along with the decline of the Spanish monarchy's prestige, led to the first of a series of Catalan separatist movements. In 1640 Catalonia revolted against Spain and placed itself under the protection of Louis XIII of France, but the revolt was quelled in the 1650s. In the War of the Spanish Succession, Catalonia declared its support for the archduke Charles and resisted the accession of the Bourbon dynasty in Spain, but in 1714 it was completely subjugated by the forces of the Bourbon Philip V, who abolished the Catalan constitution and autonomy.

Catalan separatism reemerged in the 19th century in the support given to Carlism. The resurgence really began in the 1850s, however, when serious efforts were made to revive Catalan as a living language with its own press and theatre. Catalan nationalism became a serious force after 1876 when the defeat of the Carlists led the church to transfer its support to the movement for autonomy. By 1913 Catalonia had won a slight degree of home rule, but the legislation conferring it was repealed in 1925 by Primo de Rivera, who attacked all manifestations of Catalan separatism. Rivera's policy led to the formation of a left-wing coalition party in Catalonia, the Esquerra Republicana. The Esquerra won a sweeping victory in the municipal elections of 1931, and two days later its leader proclaimed a Catalan Republic. A compromise was worked out with the central government, and in September 1932 the statute of autonomy for Catalonia became law. Catalonia played a prominent role in the history of Republican Spain and in the Civil War (1936–39). The Nationalists' victory in 1939 meant the loss of autonomy, however, and General Francisco Franco's government adopted a repressive policy toward Catalan nationalism.

The establishment of democratic rule in Spain after Franco's death did not lessen Catalonia's desire for autonomy, and in September 1977 limited autonomy was granted to the region. Full autonomy was granted in 1979 with the establishment of the autonomous community of Catalonia. The government established in 1979 consists of a Generalitat (an executive council headed by a president) and a unicameral parliament.

The autonomous community of Catalonia occupies a triangular area in the northeastern corner of Spain and is bordered by France and Andorra in the north, Aragon in the west, Valencia in the south, and the Mediterranean Sea in the east. The Pyrenees separate Catalonia from France, and to the west the pre-Pyrenees and the Ebro River basin mark the border with Aragon. To the southwest the Ebro basin gives way to coastal hills separating the Catalonian province of Tarragona from the Valencian province of Castellón.

The provinces of Tarragona, Barcelona, and Gerona have a Mediterranean shoreline, with coastal plains ringed by the low-lying Catalanides ranges. The Catalanides have historically separated the industrial towns of the coast from the predominantly agricultural settlements of the hinterlands. North of the Catalanides is a high tableland that comprises most of Lerida province. The principal rivers in Catalonia are the Ter, Llobregat, and the Ebro, all of which run into the Mediterranean. A Mediterranean climate prevails throughout most of Catalonia, with hot, dry summers and mild, relatively rainy winters.

The towns of the Catalan coast have dominated the development of the region, with the result that the population is heavily concentrated along the Mediterranean, increasingly depopulating the hinterland. In the 20th century there has been an additional concentration of population in the city of Barcelona and its satellite towns.

Catalonia's traditional agriculture was centred on the production of wine, almonds, and olive oil for export, as well as potatoes and corn (maize) as staples. Slightly more than one-third of Catalonia remains under cultivation, and the traditional crops of olives and grapes are being supplanted by fruits and vegetables for consumption in the cities. Agriculture accounts for only one-tenth of Catalonia's domestic product, however.

The Catalan textile industry first achieved prominence between 1283 and 1313 and has remained the region's premier industry. Barcelona, Sabadell, and Tarrasa are leading textile centres. The industrial sector has undergone rapid expansion and diversification since the 1950s, and the metalworking, food-processing, and chemical industries are steadily overtaking textiles in importance. Textile, papermaking and graphic arts, chemicals, and metalworking industries are concentrated in Barcelona. One of the city's plants produces many of Spain's industrial motor vehicles. Catalonia's growing demand for petroleum products has led to the expansion of Barcelona's petroleum refineries. Services, particularly those of tourism and transportation, are highly developed. Pop. (1988 est.) 6,099,319.

Catalonia Museum of Art, Spanish MUSEO DE ARTE DE CATALUÑA, museum in the Palacio Nacional in Barcelona, housing one of the most important collections of medieval paintings in the world and also a fine and complete collection of Spanish ceramics. The Romanesque Galleries comprise a series of reconstructions of church interiors with mural decorations brought from villages in the Pyrenees, transported to the museum in 1919. The exhibits include particularly fine examples of Romanesque architectural fragments such as capitals, stone carvings, and fragments from the cloister of San Pere de les Puelles, Barcelona, the latter dating from the 12th century.

Other important exhibits include paintings from the Sala Capitular of the Monastery of Sigena and tombs from Santa Maria de Matalana, Valladolid. Thirteenth-century murals taken from the Aguilar Palace, Barcelona, depict the assault on Palma, Majorca (1229), by James I of Aragon and the battle of Porto-Pi. There are also important paintings by Francisco de Zurbarán, El Greco, and Diego Velázquez. The Ceramic Museum displays Spanish decorative pottery from the 13th century to the present.

catalpa, any of 11 species of trees in the genus *Catalpa* (family Bignoniaceae), native to eastern Asia, eastern North America, and the West Indies. Catalpas have large, attractive leaves and showy, white, yellowish, or purplish flowers. The catalpa fruit is a long cylindrical pod bearing numerous seeds with white tufts of hair at each end. The common catalpa is *C. bignonioides*, which yields a durable timber

Common catalpa (*Catalpa bignonioides*)

Richard Parker

and is one of the most widely planted ornamental species.

catalufa, any of certain fishes of the bigeye (*q.v.*) group.

catalysis, in chemistry, the modification of the rate of a chemical reaction, usually an acceleration, by addition of a substance not consumed during the reaction.

A brief treatment of catalysis follows. For full treatment, see MACROPAEDIA: Chemical Reactions.

The term catalysis was first used in 1835 by the Swedish chemist Jons Jacob Berzelius to characterize phenomena observed by chemists in the late 18th and early 19th centuries. Examples of catalysis, however, were known much earlier. Such ancient techniques as fermenting wine to acetic acid and manufacturing soap from fats and bases are both achieved through catalytic reactions.

In a catalyzed reaction the catalyst generally enters into chemical combination with the reactants but is ultimately regenerated so that the amount of catalyst remains unchanged. Since the catalyst is not consumed, each catalyst molecule may induce the transformation of many molecules of reactant. For an active catalyst, the number of molecules transformed per minute by one molecule of catalyst may be as high as several million.

Where a given substance or a combination of substances undergoes two or more simultaneous reactions that yield different products, the distribution of products may be influenced by the use of a catalyst that selectively accelerates one reaction relative to the other(s). By choosing the appropriate catalyst, a particular reaction can be made to occur to the extent of practically excluding another. Many important applications of catalysis are based on selectivity of this kind.

Since a reverse chemical reaction may proceed by reversal of the steps comprising the mechanism of the forward reaction, the catalyst for a given reaction accelerates the reaction in both directions equally. Therefore, a catalyst does not affect the position of equilibrium of a chemical reaction; it affects only the rate at which equilibrium is attained. Apparent exceptions to this generalization are those reactions in which one of the products is also a catalyst for the reaction. Such reactions are termed autocatalytic.

Cases are also known in which the addition

of a foreign substance, called an inhibitor, decreases the rate of a chemical reaction. This phenomenon, properly termed inhibition or retardation, is sometimes called negative catalysis. Concentrations of the inhibitor may, in some cases, be much lower than those of the reactants. Inhibition may result from (1) decrease in the concentration of one of the reactants because of complex formation between the reactant and the inhibitor; (2) decrease in the concentration of an active catalyst ("poisoning" of the catalyst) because of complex formation between the catalyst and the inhibitor; or (3) termination of a chain reaction because of destruction of the chain carriers by the inhibitor.

Classification of catalysts. Catalysts may be classified generally according to their physical state, their chemical nature, or by the nature of the reactions that they catalyze.

Catalysts may be gases, liquids, or solids. In homogeneous catalysis, the catalyst is molecularly dispersed in the same phase (usually gaseous or liquid) as the reactants. In heterogeneous catalysis the reactants and the catalyst are in different phases, separated by a phase boundary. Most commonly heterogeneous catalysts are solids and the reactants are gases or liquids.

Heterogeneous catalysis. Heterogeneous (multiphase) catalysis most commonly proceeds through chemisorption (adsorption by chemical bonding to the surface) of at least one of the reactants on the surface of the catalyst, the site of the catalyzed reaction being the adsorbed layer. Since heterogeneously catalyzed reactions occur on the surface of the catalyst, the rates of such reactions are proportional to the accessible surface area of the catalyst. Active catalysts thus are usually highly porous solids with total surface areas as high as several hundred square metres per gram.

Theories of heterogeneous catalysis have emphasized the relation of catalytic activity to the geometrical arrangement of atoms in the catalyst surface, as well as to the electronic properties (electronic band structure, semiconductivity, etc.) of the solid catalyst.

Poisoning of a catalyst may result from adverse modification of the electronic properties of the catalyst by the poison or from blocking of the catalytic sites on the surface by adsorption of the poison in preference to adsorption of the reactant.

Enzymes. A special and important class of catalysts is comprised of the naturally occurring biological substances known as enzymes. More than a thousand enzymes have been identified, each specific to a particular chemical reaction occurring in living organisms. Enzymes include some of the most active and selective of known catalysts.

catalyst, in chemistry, any substance that increases the rate of a reaction without itself being consumed. Enzymes are naturally occurring catalysts responsible for many essential biochemical reactions.

Most solid catalysts are metals or the oxides, sulfides, and halides of metallic elements and of the semimetallic elements boron, aluminum, and silicon. Gaseous and liquid catalysts are commonly used in their pure form or in combination with suitable carriers or solvents; solid catalysts are commonly dispersed in other substances known as catalyst supports.

In general, catalytic action is a chemical reaction between the catalyst and a reactant, forming chemical intermediates that are able to react more readily with each other or with another reactant, to form the desired end product. During the reaction between the chemical intermediates and the reactants, the

catalyst is regenerated. The modes of reactions between the catalysts and the reactants vary widely and in solid catalysts are often complex. Typical of these reactions are acid-base reactions, oxidation-reduction reactions, formation of coordination complexes, and formation of free radicals. With solid catalysts the reaction mechanism is strongly influenced by surface properties and electronic or crystal structures. Certain solid catalysts, called polyfunctional catalysts, are capable of more than one mode of interaction with the reactants; bifunctional catalysts are used extensively for reforming reactions in the petroleum industry.

Catalyzed reactions form the basis of many industrial chemical processes. Catalyst manufacture is itself a rapidly growing industrial process. Some typical catalytic processes with their corresponding catalysts are given below:

process	catalyst
ammonia synthesis	iron
sulfuric acid manufacture	nitrogen(II) oxide, platinum
cracking of petroleum	silica-alumina
hydrogenation of unsaturated hydrocarbons	nickel, platinum, or palladium
oxidation of hydrocarbons in automobile exhausts	copper(II) oxide, vanadium(V) oxide, platinum, palladium
isomerization of <i>n</i> -butane to isobutane	sulfuric acid, aluminum chloride, hydrogen fluoride

catalyst poison, substance that reduces the effectiveness of a catalyst in a chemical reaction. In theory, because catalysts are not consumed in chemical reactions, they can be used repeatedly over an indefinite period of time. In practice, however, poisons, which come from the reacting substances or products of the reaction itself, accumulate on the surface of solid catalysts and cause their effectiveness to decrease. For this reason, when the effectiveness of a catalyst has reached a certain low level, steps are taken to remove the poison or replenish the active catalyst component that may have reacted with the poison. Commonly encountered poisons include carbon on the silica-alumina catalyst in the cracking of petroleum; sulfur, arsenic, or lead on metal catalysts in hydrogenation or dehydrogenation reactions; and oxygen and water on iron catalysts used in ammonia synthesis.

catamaran, twin-hulled sailing and powered boat developed for sport and recreation in the second half of the 20th century. Its design is based on a raft of two logs bridged by planks that had earlier been used by peoples in the Indonesian archipelago and throughout Polynesia and Micronesia. Early catamarans were up to 21.3 m (70 ft) long, originally paddled by many men, and used for visiting, in war, and in exploration. Especially after the sail was added, voyages of more than 3,704 km (2,000 mi) were made.

The U.S. designer of America's Cup boats Nathanael Herreshoff designed and built catamarans in the 1870s that sailed so successfully against monohulled boats that they were barred from organized racing. Production of the current form of catamaran, which averages about 12.2 m (40 ft) in length, began in the 1950s. The early catamarans tended to have difficulty coming about when sailing to windward, but later designs overcame this. The catamaran remained difficult to right after capsizing, however. Smaller catamarans raced successfully against monohulled boats in 1959, and international competition began in 1961 between the United States and Great Britain, the latter winning through 1968. Thereafter, Danish and Australian boats also competed, the Australians dominating. Catamarans are very fast boats, achieving speeds of 32.19 kph

Catamaran

(20 mph). The addition of engines also made the catamaran a popular motor-cruising boat.

Catamarca, province, northwestern Argentina, separated from Chile by the cordillera of the Andes. The province, with an area of 38,540 sq mi (99,818 sq km), is generally mountainous with intermontane tablelands and valleys (some fertile, others completely arid). The sandy desert on the west side of the Sierra del Aconquija is referred to as the Argentine Sahara.

The region constituted part of the Inca Empire after the 12th century, and pottery relics are still found. Spaniards, who settled the area in the 16th century, were subjects of the viceroyalty of Peru. For many years after liberation from Spain (1816), the caudillos (military strong men) of the Catamarca region and their gaucho armies resisted the Buenos Aires government. Wealthy landowners continued to have an independent spirit, and in 1946 Pres. Juan Perón, to suppress local criticism, deposed the provincial governor and installed a nominee of his own. In 1943, when the northern national territory of Los Andes was divided, the department of Antofagasta de la Sierra was incorporated into Catamarca.

Scarcity of water has hindered agricultural development; irrigation, supporting mainly alfalfa, vineyards, olive and walnut groves, and cattle, provides only a partial remedy. Tungsten and mica are mined. The province's virtual isolation accounts for a retention of traditions and has encouraged tourism. The provincial capital, Catamarca (*q.v.*), has rail and bus transportation facilities. Pop. (1999 est.) 312,269.

Catamarca, also called SAN FERNANDO DEL VALLE DE CATAMARCA, city, capital of Catamarca province, northwestern Argentina, on the Río del Valle de Catamarca, a river between the two south-pointing spurs of the Andean sierras of Ambato and Ancasti. Originally named Londres, it was founded by the explorer Juan Pérez de Zurita (1559) in the Valle de Quinivil. Following various moves

The Church of the Virgin of the Valley, Catamarca city, Arg.

Juan Carlos Franceschi

due to hostile Indians, Catamarca was established in 1694 on its present site (a sheltered, fertile valley) by the provincial governor, Bartolomé de Castro. The economy is basically agricultural and includes the production and processing of grapes, alfalfa, cotton, cereals, hides, and meat. Tourism has increased because of a mild winter climate, outstanding scenery, and hot springs in the nearby sierras. The city is known for its handwoven woolen ponchos. Several colonial buildings survive, including the Church of the Virgin of the Valley (1694; a pilgrimage centre declared a national monument in 1941) and a Franciscan convent (1694). The city has an art gallery and a museum of fine arts. Pop. (1999 est.) 140,000. --

catamount (mammal): *see* puma.

Catanduanes, island, east-central Philippines, in the Philippine Sea, separated from southeastern Luzon (Rungus Point) by the shallow Maqueda Channel. The island has an area of 550 square miles (1,425 square km). Farming is diversified (rice, corn [maize], copra, abaca) on the hilly, rolling land. Virac, the chief port, is on the southern coast in a lowland area. The island is known for its stone churches. Pop. (2000) Catanduanes and small adjacent islands, 215,356.

Catanduva, city, in the highlands of north-central São Paulo *estado* ("state") Brazil, on the São Domingos River at 1,630 feet (497 m) above sea level. Originally called Vila Adolfo, the settlement was given town status in 1909 and was made the seat of a municipality in 1917. Coffee is the principal crop of the region, which also raises cotton, corn (maize),

Cattle fair at Catanduva, Braz.

Plessner International

rice, *feijão* (beans), and peanuts (groundnuts). Catanduva's industries process these products as well as hides and skins. The city is linked to the state capital, São Paulo, 210 miles (340 km) southeast, and to neighbouring urban centres by railroads, highways, and air. Pop. (2000 prelim.) 105,771.

Catania, Latin *CATANA*, or *CATINA*, city, capital of Catania *provincia*, eastern Sicily, Italy, in the broad plain of Catania on the Ionian sea coast, south of Mount Etna. The city was founded in 729 BC by Chalcidians

Castello Ursino, Catania, Sicily

V. Dia—SCALA from Art Resource/EB Inc

(settlers from Chalcis in the Greek island of Euboea) from Naxos, 50 miles (80 km) north. It acquired importance in the 5th century BC with Hieron I, tyrant of Syracuse, and his son Deinomenes, who conquered it and renamed it Aetna after the volcano. The inhabitants restored the old name after driving out Deinomenes' followers. One of the first Sicilian towns to fall to the Romans (263 BC), Catania was made a colony by Octavian (later the emperor Augustus). The Christians there suffered under the persecutions of the emperors Decius and Diocletian, and the Catanian martyrs included St. Agatha, patron saint of the city. After the barbarian invasions, Catania fell successively to the Byzantines, the Arabs, and the Normans. It was hostile to the Swabian emperors and was sacked by Henry VI and Frederick II. The Aragonese sovereigns of the Kingdom of Sicily often resided there. During the 16th and 17th centuries the city was afflicted by civil disorders, pirate incursions, epidemics, famines, and natural disasters, including an eruption of Etna in 1669 and an earthquake in 1693. Later it became subject to the Bourbon kingdom of Naples. Civil disturbances occurring during an outbreak of cholera in 1837 were vigorously suppressed, and, when in 1848 Catania joined the other cities of the island in claiming autonomy for Sicily, this movement was also put down by force. In World War II the city suffered severe damage from bombing and heavy fighting in 1943.

Standing almost entirely on the lava left by various eruptions, the city slopes slightly downward from north to south. The use of volcanic tufa for building has given the older part of the city its prevailing dark-gray colour. Almost completely rebuilt after the 1693 earthquake, the centre of the city has a distinctly 18th-century appearance. Ancient remains include the ruins of Greek and Roman theatres, and a Roman amphitheatre, basilica, baths, and aqueducts. The Ursino Castle with its four angular towers, constructed (1239–50) for Frederick II, long served as a model of military architecture. It now houses the civic museum with rich collections of art and archaeological relics.

The centre of modern civic life is the Duomo Piazza, surrounded by 18th-century palaces and opening onto wide streets. Of the original structure of the cathedral founded by the Norman count Roger I in 1091, three apses of dark lava and part of the transept remain. After the 1693 earthquake it was rebuilt by the architects Fra Fiorenzo Palazotto and Giovanni Battista Vaccarini (1702–68). The cathedral contains relics of St. Agatha and the tomb of the composer Vincenzo Bellini, a native of Catania. The Church of San Nicola (1693–1735), the largest in Sicily, is connected with the former Benedictine monastery of the same name; it was begun in the 14th century and completed in the 17th century. The university, the first in Sicily, was founded in 1434 by Alfonso of Aragon, and its library (1755) possesses a number of important medieval manuscripts. Other notable landmarks include the Baroque Church of Santa Agata, the town hall by Vaccarini, the elephant fountain (1736) in the Duomo Piazza, the Collegiata (or royal chapel), the astronomical observatory, and the birthplace of Vincenzo Bellini, now a museum.

Modern Catania, the second largest city in Sicily, is an industrial and transportation centre, connected by rail with Palermo, Messina, and Syracuse, with one of the busiest ports in Italy. Industries include a variety of mechanical and chemical manufactures, food processing, and fishing. About half of Sicily's refined sulfur comes from the factories of Catania. The marketing centre for the surrounding agricultural region, it exports almonds and oranges, as well as handwork in metal, wood, and amber. It is also a popular winter resort

with fine beaches nearby. Pop. (1999 est.) mun., 337,862.

Catania, Gulf of, Italian *GOLFO DI CATANIA*, inlet of the Ionian Sea on the eastern coast of Sicily. About 20 miles (32 km) long and 5 miles (8 km) wide, it lies between Cape Camplato (south) and Cape Molini (north). The gulf receives the Simeto River below Catania, its chief port.

Catanzaro, city, capital of Catanzaro *provincia* and of Calabria *regione*, southern Italy, at an elevation of 1,125 feet (343 m) overlooking the Gulf of Squillace, southeast of Cosenza. Founded about the 10th century as *Catasarion*, a Byzantine town, it was taken in 1059 by the Norman leader Robert Guiscard. Invading peoples from the Saracens to the Swiss, Normans, and Angevins (house of Anjou) recognized its strategic and military importance. In 1528 it resisted a four-month siege by the French. It also played an important part in the Napoleonic Wars and the *Risorgimento* (movement for Italian unity). The seat of an archbishop from 1928, it became the regional capital in 1971. Catanzaro suffered severely from earthquakes in 1783, 1905, and 1907 and was bombed by the Allies in World War II. The provincial museum contains collections of antiquities and paintings, and in the Baroque Church of San Domenico is a Madonna del Rosario (17th-century Neapolitan school).

Silk weaving won the town a worldwide reputation during the 17th and 18th centuries. A rail junction with a port (Marina di Catanzaro) on the Gulf of Squillace, Catanzaro is a trade centre for olive oil and manufactures fertilizer. Pop. (1998 est.) mun., 97,118.

cataphoresis (physical chemistry): *see* electrophoresis.

Cataphrygian heresy: *see* Montanism.

catapult, mechanism for forcefully propelling stones, spears, or other projectiles, in use since ancient times. The Romans used the word *bal-*

Catapult

Document Larousse

ista to designate an engine used to hurl stones and *catapulta* for one that shot arrows and darts, although the larger catapults mounted a single long arm, which hurled stones and other objects. Nearly all catapults employed in ancient and medieval artillery operated by a sudden release of tension on wooden beams or twisted cords of horsehair, gut, sinew, or other fibres. An exception was the medieval trebuchet, powered by a counterweight. Modern mechanisms using hydraulic pressure, tension, or other force to launch gliders, aircraft, or missiles are also called catapults.

cataract, in medicine, opacity of the crystalline lens of the eye. If the opaque areas are minute, scattered dots (a condition known as blue dot cataract, or punctate cataract) or if only the periphery of the lens is affected (this type, called coronary cataract, is said to affect 25 percent of the population), there may be no appreciable diminution of vision. In instances of cataracts that do seriously impair vision, the standard treatment is surgical removal of the lens.

Cataracts that seriously affect vision may be present at birth. Congenital cataract may number among the defects that originate in a mother's infection with German measles (rubella) during the first three months of pregnancy. Cataracts may form in infants that have galactosemia, a hereditary metabolic disease in which there is inability to utilize galactose, a derivative of milk sugar. Babies with rickets may have cataracts, as may those with Down's syndrome or hypothyroidism. Cataracts in infants are in most cases not progressive. If the opacity is severe, these cataracts are known as white eye, in reference to the appearance of the pupil.

Diabetes mellitus, particularly in young persons whose diabetes is not well controlled, may cause cataracts. The disease may also impair vision by its effect upon the retina.

Cataracts may result from prolonged exposure to heat, as in glassblowing or iron puddling, to X rays, or to bombardment with subatomic particles, especially neutrons.

The best-known form of cataract is the type that develops with advancing age. Such cataracts result from the continuing growth of the lens throughout life and its concomitant increase in density. If the opaque area is in the central area of the lens, the eventual loss of vision is greater than that produced by peripheral cataracts. In the early stages of the growth of the cataract, near vision may temporarily improve to the point that the affected person finds it possible to read without glasses.

cataract, a waterfall (*q.v.*), especially one containing great volumes of water rushing over a precipice.

Catargiu, Lascăr (b. Nov. 13, 1823—d. April 11, 1899, Bucharest, Rom.), Romanian statesman, four times prime minister (1866, 1871–76, 1889, 1891–95), who played a leading role in national affairs through the country's early years of independence.

In 1858 Catargiu served on the Moldavian *divan ad hoc* (representative commission) formed to determine the future political organization of the Danubian principalities—Moldavia and Walachia—and in 1859 was the Conservative candidate for the throne of Moldavia. After the unification of the principalities, he joined the secret committee that successfully planned the overthrow of the first prince of united Romania, Alexandru Cuza, and his replacement by Prince Karl of Hohenzollern-Sigmaringen (1866), thereafter prince, and later (1881) King Carol I. From February 1866 until the accession of Carol in May, he served on the three-member governing regency and, from May to July 1866, headed his first cabinet. During the antidynastic agitation of 1871, he was called to form another government, which lasted until 1876. Subsequently in opposition, he led his Conservative Party in violent attacks against the ruling Liberals. After the fall of the Liberals in 1888, he twice more served as premier—briefly in 1889 and later from 1891 to 1895. His last administrations were marked by certain land and financial reforms and a generally creditable domestic record.

Catarina (Portuguese personal name): *see under Catherine*.

catarrhine: *see* Old World monkey.

catastrophic theory, in mathematics, a set of methods used to study and classify the ways in which a system can undergo sudden large changes in behaviour as one or more of the variables that control it are changed continuously. Catastrophe theory is generally considered a branch of geometry because the variables and resultant behaviours are usefully depicted as curves or surfaces, and the formal

development of the theory is credited chiefly to the French topologist René Thom.

A simple example of the behaviour studied by catastrophe theory is the change in shape of an arched bridge as the load on it is gradually increased. The bridge deforms in a relatively uniform manner until the load reaches a critical value, at which point the shape of the bridge changes suddenly—it collapses. While the term catastrophe suggests just such a dramatic event, many of the discontinuous changes of state so labeled are not. The reflection or refraction of light by or through moving water is fruitfully studied by the methods of catastrophe theory, as are numerous other optical phenomena. More speculatively, the ideas of catastrophe theory have been applied by social scientists to a variety of situations, such as the sudden eruption of mob violence.

catastrophism, doctrine that explains the differences in fossil forms encountered in successive stratigraphic levels as being the product of repeated cataclysmic occurrences and repeated new creations. This doctrine generally is associated with the great French naturalist Baron Georges Cuvier (1769–1832). One 20th-century expansion on Cuvier's views, in effect, a neocatastrophic school, attempts to explain geologic history as a sequence of rhythms or pulsations of mountain building, transgression and regression of the seas, and evolution and extinction of living organisms.

Catumbo River, Spanish *RÍO CATATUMBO*, river rising in northern Colombia. It flows northeast across the Venezuelan border, crosses rich oil-bearing regions in the Maracaibo Lowland, and empties into Lake Maracaibo after a course of about 210 miles (338 km). It is navigable in its lower course and receives Zulia River 4 miles (6 km) west of Encontrados, Venez., in the Maracaibo Lowland.

Catawba, North American Indian tribe of Siouan language stock who inhabited the territory around the Catawba River in the Carolinas. Their principal village was on the west side of the river in what is now York county, S.C. They were known among white traders as flatheads because, like a number of other tribes of the Southeast, they practiced ritual deformation of the head on male infants.

Catawba villages consisted of bark-covered cabins and a temple for public gatherings and religious ceremonies. Each village was governed by a council presided over by a chief. They subsisted principally by farming, harvesting two or more crops of corn (maize) in the same year and growing several varieties of beans, squash, and gourds in one field. In some Southeast tribes the farming was done by the women, but among the Catawba it was the men who farmed. A plentiful supply of passenger pigeons served as winter food. The Catawba made bowls, baskets, and mats, which they traded to other tribes and to white colonists for meat and skins. Fish was also a staple of their diet; they caught sturgeon and herring using weirs, snares, and long poles.

In the 17th century the Catawba numbered about 5,000. After contact with European settlers they became virtual satellites of the various colonial factions. Their numbers fell off rapidly (in 1738 half the tribe was wiped out in a smallpox epidemic) so that by 1780 there were only about 500 Catawba left. They were allies of the English in the Tuscarora War (1711–13) and in the French and Indian War (1754–63), and they aided the colonists in the American Revolution. In the late 20th century about 1,200 descendants of the Catawba were living around Rock Hill in South Carolina.

catbird, any of several bird species named for their mewing calls, which are used in addition to song. The North American catbird (*Dumetella carolinensis*), of the family Mimidae (order Passeriformes), is 23 cm (9 inches)

North American catbird (*Dumetella carolinensis*)
Thase Daniel—Bruce Coleman Inc

long and is gray, with a black cap. It frequents gardens and thickets. The black catbird (*Melanoptila glabrirostris*) is found in coastal Yucatán.

The three species of the genus *Ailuroedus*, of the bowerbird family (Ptilonorhynchidae), are also called catbirds. These green birds occur in Australia, New Guinea, and nearby islands. The male does not build a bower but holds territory in the forest by loud singing. For the related tooth-billed catbird, *see* bowerbird.

catch, also called **ROUND**, perpetual canon designed to be sung by three or more voices, especially popular in 17th- and 18th-century England. Like all rounds, catches are indefinitely repeatable pieces in which all voices begin the same melody on the same pitch but enter at different time intervals. The name may derive from caccia, a 14th-century canonic form, or may refer to each singer's "catching" the tune in turn. Catch texts were often humorous or ribald, and in some instances a pause in the melody in one voice was filled in by the notes and text of another, creating a pun or change of meaning.

Literary evidence shows that catch singing was a popular social activity in the 16th century, although the first published collection was Thomas Ravenscroft's very successful *Pammelia* (1609). Two other publications of his also contained catches: *Deuteromelia* (1609), which included "Three Blind Mice," and *Melismata* (1611). Perhaps the most famous of such publications was John Hilton's *Catch That Catch Can* (1652).

The zenith of the catch came after the restoration of the monarchy in 1660, when the finest composers vied with one another in lavishing ingenuity and indecency on the form. Henry Purcell ranks supreme on the first account and very high on the second.

During the 18th century, catch clubs became popular (*e.g.*, the Noblemen's and Gentlemen's Catch Club, founded 1761). The genre became textually more polite and musically insipid, although it remained popular. Most later editions of Restoration catches were bowdlerized, but since the 1950s occasional unexpurgated editions have appeared.

catchfly (plant): *see* campion.

catchment area: *see* drainage basin.

Cateau-Cambrésis, Peace of (April 3, 1559), agreement marking the end of the 65-year (1494–1559) struggle between France and Spain for the control of Italy, leaving Habsburg Spain the dominant power there for the next 150 years. In the last phase of the war, fought mostly outside of Italy, France was beaten at the battles of Saint-Quentin (1557) and Gravelines (1558). These defeats, coupled with the beginning of the religious struggle between the Roman Catholics and the Huguenots in France, and the financial

difficulties of both powers, led to the peace. Henry II of France restored Savoy and Piedmont to Spain's ally, Emmanuel-Philibert of Savoy; Henry also restored Corsica to Genoa and renounced his hereditary claim to Milan. Although France finally gave up its claims to Italian territory and Spain retained the predominant position in Italy that it had secured in the Treaty of Cambrai in 1529, France managed to retain five fortresses, including Turin, Saluzzo, and Pignerol. Elsewhere, France also retained the three bishoprics of Toul, Metz, and Verdun, which it had captured from the Habsburg emperor Charles V in 1552, and Calais, which it had taken from Spain's allies the English in 1558.

catechesis (theology): see kerygma and catechesis.

catechetical school, in early Christianity, a type of educational institution with a curriculum directed toward inquirers (especially those trained in the Greek *paideia*, or educational system) whose aim was to gain a greater knowledge of Christianity and eventually, perhaps, baptism into the Christian community. Located in such centres as Alexandria, the catechetical schools became prototypes for later Christian institutions of higher learning.

catechism, a manual of religious instruction usually arranged in the form of questions and answers used to instruct the young, to win converts, and to testify to the faith. Although many religions give instruction in the faith by means of oral questions and answers, the written catechism is primarily a product of Christianity. Some early handbooks of instruction were prepared by the Church Fathers (including Augustine of Hippo, John Chrysostom, and Cyril of Jerusalem), and many were prepared throughout medieval times. The term catechism, however, was evidently first used for written handbooks in the 16th century.

After the invention of printing and the 16th-century Reformation, catechisms became much more important, both in Protestantism and Roman Catholicism. These catechisms were influenced by the medieval catechism, which had imitated the works of the Church Fathers. The medieval catechisms concentrated upon the meaning of faith (the Apostles' Creed), hope (the Lord's Prayer), and charity (the Ten Commandments). The later catechisms usually included discussions of these three subjects and added others.

Perhaps the most influential book produced by any Reformer was Martin Luther's *Small Catechism* (1529), which added discussions of baptism and the Eucharist to the usual three subjects. Luther's *Large Catechism* (1529) was intended for use by the clergy.

John Calvin published a catechism in 1537 that was intended to instruct children. It proved too difficult, so he prepared an easier version in 1542. The *Heidelberg Catechism* (1563) of Caspar Olevianus and Zacharias Ursinus (revised by the Synod of Dort in 1619) became the most widely used catechism in the Reformed churches. The standard Presbyterian catechisms have been the Westminster Larger and Shorter Catechisms, completed by the Westminster Assembly in 1647.

The Anglican catechism is included in *The Book of Common Prayer*. The first part was probably prepared by Thomas Cranmer and Nicholas Ridley in 1549 and was modified several times before 1661. A second part, discussing the meaning of the two sacraments, was prepared in 1604 in response to a suggestion of the Puritan faction of the Hampton Court Conference.

The most famous Roman Catholic catechism was one by Peter Canisius, a Jesuit, first published in 1555, which went through 400 editions in 150 years. One that had a large circulation and greatly influenced later works was that of Robert Bellarmine (1597).

In France, those of Edmond Auger (1563) and Jacques-Bénigne Bossuet (1687) were outstanding. In more recent times, well-known Roman Catholic catechisms have included the *Baltimore Catechism* (1885) in the United States, *A Catechism of Christian Doctrine* ("Penny Catechism") in England (1898), and that of Joseph Deharbe (1847) in Germany. In 1992 the Vatican issued a new universal *Catechism of the Catholic Church* that summarized the church's doctrinal positions and teachings since the second Vatican Council (1962-65). The new catechism abandoned the question-and-answer form and used modern language in its prescriptions on faith, the sacraments, sin, and prayer.

In reaction to the work of the Jesuits and the Reformed church among the Orthodox, Peter Mogila composed *The Orthodox Confession of Faith*. It was approved at a provincial synod in 1640 and standardized by the synod of Jerusalem in 1672. By order of the Russian tsar Peter I the Great, a smaller Orthodox catechism was prepared in 1723.

catecholamine, any of various naturally occurring amines that function as neurotransmitters and hormones within the body. Catecholamines are characterized by a catechol group (a benzene ring with two hydroxyl groups) to which is attached an amine (nitrogen-containing) group. Among the catecholamines are dopamine, norepinephrine, and epinephrine.

All catecholamines begin with the amino acid L-tyrosine. Through a series of enzymatic reactions, L-tyrosine is converted to L-dopa, then to dopamine, then to norepinephrine, and finally to epinephrine. Catecholamines are synthesized in the brain, in the adrenal medulla, and by some sympathetic nerve fibres.

The neurotransmitter dopamine is widely distributed throughout the central nervous system and is involved in the control of movement. Norepinephrine is an important neurotransmitter in both the central nervous system and the sympathetic division of the autonomic nervous system. The hormone epinephrine acts in concert with the sympathetic nervous system to initiate the body's quick response to stressful stimuli (the "fight or flight" response).

catechu, also called CATCH, or CASHOO, extract used in dyeing and tanning. It is obtained from several plants, its chief sources being the wood of two species of *Acacia*, *A. catechu* and *A. suma*, both natives of India. This extract is known as black catechu. A similar extract, known in pharmacy as pale catechu and in commerce as gambier, or terra japonica, is produced from the leaves of *Uncaria gambir* and *U. acida*, plants of the Indonesian archipelago. These extracts have a sweetish taste and are used in medicine as astringents. They consist chiefly of mixtures of catechutannic acid and catechin or catechuic acid.

The name catechu also is applied to an extract obtained from areca nuts, or betel nuts, the seeds of the fruit of *Areca catechu*, a palm of Southeast Asia. It consists of the alkaloid arecoline, which is used as a worming agent in animals.

catechumen, a person who receives instruction in the Christian religion in order to be baptized. According to the New Testament, the apostles instructed converts after baptism (Acts 2:41-42), and Christian instruction was evidently given to all converts (Luke 1:4, Acts 18:25, Galatians 6:6). As the number of Gentiles in the church increased, instruction became more definite. In the 4th century, with the rise of heresy, detailed doctrinal teaching was given. But by this time the postponement of baptism had become general (Constantine was not baptized until he was at the point of death), and, therefore, a large proportion

of Christians belonged to the catechuminate. Most of them were merely "adherents" of the church, while others were under definite instruction for baptism. As infant baptism became general, the catechuminate decreased. The baptismal rites now used are adaptations of rites intended for the reception of adult catechumens.

Catechumens, Liturgy of the, the instructional part of the Christian worship service, consisting of hymns, prayers, scriptural readings, and homilies, which precedes the Eucharist (*i.e.*, the Liturgy of the Faithful). In the early church the catechumens, or hearers who had not yet been baptized, were dismissed at the conclusion of the Liturgy of the Catechumens, and the faithful, or baptized Christians, remained to celebrate the mystery of the Eucharist, also called Holy Communion.

categorical imperative, in the ethics of the 18th-century German philosopher Immanuel Kant, founder of critical philosophy, a moral law that is unconditional or absolute for all agents, the validity or claim of which does not depend on any ulterior motive or end. "Thou shalt not steal," for example, is categorical as distinct from the hypothetical imperatives associated with desire, such as "Do not steal if you want to be popular." For Kant there was only one such categorical imperative, which he formulated in various ways. "Act only according to that maxim by which you can at the same time will that it should become a universal law" is a purely formal or logical statement and expresses the condition of the rationality of conduct rather than that of its morality, which is expressed in another Kantian formula: "So act as to treat humanity, whether in your own person or in another, always as an end, and never as only a means."

categorical proposition, in syllogistic or traditional logic, a proposition or statement, in which the predicate is, without qualification, affirmed or denied of all or part of the subject. Thus, categorical propositions are of four basic forms: "Every *S* is *P*," "No *S* is *P*," "Some *S* is *P*," and "Some *S* is not *P*." These forms are designated by the letters *A*, *E*, *I*, and *O*, respectively, so that "Every man is mortal," for example, is an *A*-proposition. Categorical propositions are to be distinguished from compound and complex propositions, into which they enter as integral terms; in particular, being assertions of fact rather than of logical connections, they contrast especially with hypothetical propositions, such as "If every man is mortal, then Socrates is mortal."

category, in logic, a term used to denote the several most general or highest types of thought forms or entities, or to denote any distinction such that, if a form or entity belonging to one category is substituted into a statement in place of one belonging to another, a nonsensical assertion must result.

The term was used by Aristotle to denote a predicate type; *i.e.*, the many things that may be said (or predicated) of a given subject fall into classes—such as quantities, substances, relations, and states—which Aristotle called categories. To the Greeks, the clarification of predicate categories helped resolve questions that seemed to be paradoxes. In the course of a year or so, for example, Socrates could cease to be taller and come to be shorter than Alcibiades; so he is not now what he was at an earlier date. Yet he does not cease to be a human being. One may wonder how he can not be what he used to be (taller) and still be what he used to be (a human being). The answer is that the categories are different: a change of relation is not a change of substance.

Though the Stoics, philosophers of ancient Greece, had recognized only 4 "most generic"

notions. Aristotle's 10 categories were treated throughout the Middle Ages as though they were definitive. In a commentary on Aristotle's *Categoriae* (*Categories*), the Neoplatonist Porphyry set the stage for the entire medieval controversy over universals, or general abstract terms (see Nominalism), and he thus posed the issues that any theory of categories must resolve.

In the 18th century Immanuel Kant revived the term category to designate the different types of judgments or ways in which logical propositions function. It should thus be clear that, whereas Kant retained the Aristotelian term "category" and even some of the sub-terms, such as "quality," "quantity," and "relation," his distinctions were different from those of Aristotle. For Aristotle, for example, "quality" referred to such predicates as "white" or "sweet," whereas for Kant it designated the distinction between affirmative and negative.

After Kant, G.W.F. Hegel arranged many categories in a dialectical structure of ascending triads and thus initiated the modern tendency to regard them as many and as comprising the basic principles of a logical and/or metaphysical system; thus, for Hegel the categories encompassed both form and content. Early in the 20th century Bertrand Russell, faced with a "contradiction" in the foundations of mathematics, developed the theory of types, which distinguished different levels of language and held that the levels should not be intermixed.

Meanwhile, Charles Sanders Peirce, an American logician and Pragmatist, arguing from Kant's categories, proposed a reduced list of categories. He defended the view that there can be three and only three types of predicates: "firstness," that of "pure possibility"; "secondness," that of "actual existence"; and "thirdness," that of "real generality." Clearly, if universals belong to the category of thirdness, then the Nominalist, who urges that universals have no existence (the secondness category) is confusing categories and, by the definition of "category," is making a nonsensical statement. Such misjudgments, made famous as "category-mistakes" by Gilbert Ryle, a mid-20th-century Oxford Analytical philosopher, have played an important role in recent linguistic philosophy, which, with its proliferation of categories, has applied this critique, with powerful therapeutic effect, to philosophical discourse.

Stanisław Leśniewski (1886–1939), a Polish logician, and Rudolf Carnap (1891–1970), a German-American semanticist, distinguished between syntactical categories (dealing with the interrelations of concepts) and semantical categories (dealing with concepts and referents). Distinctions akin to those of Aristotle are thus apt to be described today as semantical, as distinctions between kinds or modes of significance rather than kinds of linguistic expressions or of things or happenings. P.F. Strawson, another Oxford philosopher, discussed the implications of category theory for a descriptive metaphysics.

catenary, the curve describing the shape taken by a homogeneous cable that is suspended by its endpoints. Any freely hanging cable assumes this shape, also called a chainette, if the body is of uniform mass per unit of length and is acted upon solely by gravity.

The general equation of a catenary is $y = a \cosh(x/a)$, in which a is a constant, the distance between the lowest point of the curve and a reference axis. If $a=1$, the equation is that of the hyperbolic cosine (cosh).

The approximate curve may be observed in the cables of suspension bridges. The catenary

Catenary curve

can be generated as the locus of the focus of a parabola rolling along a straight line.

catenation, chemical linkage into chains of atoms of the same element, occurring only among the atoms of an element that has a valence of at least two and that forms relatively strong bonds with itself. The property is predominant among carbon atoms, significant among sulfur and silicon atoms, and slightly present among germanium, nitrogen, selenium, and tellurium atoms. See also polymerization.

caterpillar, larva of a butterfly or moth (Lepidoptera). Caterpillars have cylindrical bodies consisting of 13 segments, with three pairs of legs on the thorax and several on the abdomen. The head has six eyes on each side, short antennae, and strong jaws. Many caterpillars within the Lepidoptera are called worms, such as the measuring worm, silkworm, and army worm. Caterpillar-like, or eruciform, larvae also occur in other insect groups, namely the scorpionflies (Mecoptera) and the sawflies (Hymenoptera).

Caterpillar Inc., formerly (1925–86) CATERPILLAR TRACTOR COMPANY, major American manufacturer of earth-moving, construction, and materials-handling equipment. Caterpillar also makes diesel and natural gas engines for industrial and marine use. Headquarters are in Peoria, Ill.

Benjamin Holt, the owner of a California heavy equipment company, invented the familiar "caterpillar" tractor a few years before World War I. The tractors ran on continuous metal-belted tracks instead of wheels. The tracks kept the heavy tractors from sinking in mud or dirt, and during the war British and American forces successfully used such treads on their armoured tanks.

In 1925 Holt's firm, Holt Manufacturing Company, was merged with the C.L. Best Tractor Company and was incorporated as the Caterpillar Tractor Company. Headquarters were moved to Illinois. In 1963 Caterpillar formed one of the first joint ventures between an American and a Japanese company when they began operations with Mitsubishi Heavy Industries Ltd. The company struggled during the economic downturn in the early 1980s but by the late '80s had regained its footing. Acquisitions of the U.K. company Perkins Engine and the German company MaK Motoren allowed Caterpillar to become the world leader in diesel engine manufacture in the 1990s.

Caterpillar produces a wide variety of machines used in agriculture, construction, logging, mining, petroleum, industrial warehousing, and public service markets.

Catesby, Robert (b. 1573, Lapworth, Warwickshire, Eng.—d. Nov. 8, 1605, Holbeche House, Staffordshire), chief instigator of the Gunpowder Plot, a Roman Catholic conspiracy to blow up King James I and the English Parliament on Nov. 5, 1605.

A member of a staunchly Roman Catholic family, Catesby became embittered against the government of Queen Elizabeth I as he saw his father, Sir William, persecuted for refusing to conform to the Church of England. In 1601 Robert Catesby was imprisoned and fined for joining the abortive uprising of Robert Devereux, 2nd earl of Essex. Upon his release he set about promoting a Spanish invasion of England, and as a result he was again briefly imprisoned shortly before Elizabeth's death in March 1603.

Catesby placed little faith in the promises of religious toleration made by Elizabeth's successor, King James I (reigned 1603–25). As early as May 1603 he conceived the idea of destroying both king and Parliament by exploding gunpowder under the Parliament building, and in January 1604 he began to assemble a group of zealous Catholics to carry out his scheme, including the soldier Guy Fawkes and Thomas Percy. But the government learned of the plot, and on Nov. 4, 1605, Fawkes was arrested. Catesby fled from London and took refuge in Holbeche House, Staffordshire, where he was killed while resisting government troops. The plot intensified anti-Catholic feelings in England.

catfish, any of the fishes of the order Siluriformes. Catfishes are related to the characins, carp, and minnows (order Cypriniformes) and may be placed with them in the superorder Ostariophysii. Some authorities, however, consider these groups suborders, rather than a single order, and classify them as the suborders

Channel catfish (*Ictalurus punctatus*)

Siluroidea (catfishes) and Cyprinoidea (characins, carp, and minnows) of the order Cypriniformes or Ostariophysii.

The name catfish refers to the long barbels, or feelers, which are present about the mouth of the fish and resemble cat whiskers. All catfishes have at least one pair of barbels, on the upper jaw; they may also have a pair on the snout and additional pairs on the chin. Many catfishes possess spines in front of the dorsal and pectoral fins. These spines may be associated with venom glands and can cause painful injuries to the unsuspecting. All catfishes are either naked or armoured with bony plates; none has scales.

Living catfishes constitute about 2,500 species placed in about 30 families. The majority of species inhabit fresh water, but a few, belonging to the families Ariidae and Plotosidae, are marine. Freshwater catfishes are almost worldwide in distribution and live in a variety of habitats from slow or stagnant waters to fast mountain streams; marine catfishes are found in the shore waters of the tropics. Catfishes are generally bottom dwellers, more active by night than by day. Most are scavengers and feed on almost any kind of animal or vegetable matter. All species are egg layers and may exhibit various types of parental care. The brown bullhead (*Ictalurus nebulosus*), for example, builds and guards a nest and protects its young, while male sea catfishes (Ariidae) carry the marble-sized eggs, and later the young, in their mouths.

Catfishes vary considerably in size. Small species, such as the dwarf *Corydoras*, or micro cat (*C. hastatus*), may be as little as 4 or 5 centimetres (1½–2 inches) long, while the wels (*Silurus glanis*), a large, European species, may be 4.5 metres (15 feet) in length and 300

kilograms (660 pounds) in weight. A number of the smaller species, especially those of the genus *Corydoras*, are popular aquarium fishes, while many of the larger catfishes are edible and used as food. Notable examples of the latter are the many North American food and sport fishes of the family Ictaluridae, among them the blue catfish (*Ictalurus furcatus*), with a maximum length and weight of 1.5 metres and 68 kilograms, and the channel catfish (*I. punctatus*), growing to about 1 metre and 12 kilograms.

The ictalurids are more or less typical catfishes; others, however, may be distinctive in appearance or behaviour. The glass catfish (*Kryptopterus bicirrhus*), for example, is a popular aquarium fish of the family Siluridae noted for its slender, highly transparent body; the banjo catfishes (Aspredinidae) of South America are slim fishes with rough, flattened heads and from above somewhat resemble banjos; the electric catfish (*Malapterurus electricus*) of Africa can generate up to 450 volts of electricity; the parasitic catfish, or candiru (*Vandellia cirrhosa*), of South America sometimes invades the urogenital openings of bathers; the talking catfish (*Acanthodoras spinosissimus*) is an armoured, Amazonian species that makes grunting sounds; the upside-down catfishes (*Synodontis batensoda* and others) of the family Mochokidae habitually swim upside down; the walking catfish (*Clarias batrachus*) is an air breather of the family Clariidae that can travel overland.

For more information about catfish species and groups, see bullhead; candiru; corydoras; electric catfish; madtom; wels. The catfish is also important in fish farming (*q.v.*).

catgut, tough cord made from the intestines of certain animals, particularly sheep, and used for surgical ligatures and sutures, for the strings of violins and related instruments, and for the strings of tennis rackets and archery bows. The ancient Egyptians and Babylonians and the later Greeks and Romans used the intestines of herbivorous animals for much the same purposes. The origin of the term catgut is obscure; it is not known if the intestines of cats were ever put to such uses.

The intestinal tubes (called runners) of sheep are washed, cut in ribbons, and scraped free of mucous membrane and circular muscle tissue. The ribbons are placed in an alkaline bath for several hours and then stretched on frames. While still moist they are removed, sorted by size, and twisted into cords of varying thickness. A smoothing and polishing operation completes the process.

Italian catgut is considered the best for stringing musical instruments. Surgical catgut is sterilized by heat applied in progressive steps and maintained for several hours; it is often treated with an impregnating agent.

Cathari (from Greek *katharos*, "pure"), also spelled CATHARS, heretical Christian sect that flourished in western Europe in the 12th and 13th centuries. The Cathari professed a neo-Manichaean dualism—that there are two principles, one good and the other evil, and that the material world is evil. Similar views were held in the Balkans and the Middle East by the medieval religious sects of the Paulicians and the Bogomils; the Cathari were closely connected with these sects.

In the first half of the 11th century isolated groups of such heretics appeared in western Germany, Flanders, and northern Italy. In the late 11th century no more was heard of them; then in the 12th century they reappeared. A period of rapid growth came in the 30 years following 1140. At about this time the Bogomil Church was reorganizing itself, and Bogomil missionaries, as well as Western dualists returning from the Second Crusade (1147–49), were at work in the West in the middle of the century. From the 1140s the Cathari were an organized church with a hierarchy, a liturgy,

and a system of doctrine. About 1149 the first bishop established himself in the north of France; a few years later he established colleagues at Albi and in Lombardy. The status of these bishops was confirmed and the prestige of the Cathar Church enhanced by the visit of the Bogomil bishop Nicetas in 1167. In the following years more bishops were set up, until by the turn of the century there were 11 bishoprics in all, 1 in the north of France, 4 in the south, and 6 in Italy.

Although the various groups emphasized different doctrines, they all agreed that matter was evil. Man was an alien and a sojourner in an evil world; his aim must be to free his spirit, which was in its nature good, and restore it to communion with God. There were strict rules for fasting, including the total prohibition of meat. Sexual intercourse was forbidden; complete ascetic renunciation of the world was called for.

The extreme asceticism made the Cathari a church of the elect, and yet in France and northern Italy it became a popular religion. This success was achieved by the division of the faithful into two bodies: the "perfect" and the "believers." The perfect were set apart from the mass of believers by a ceremony of initiation, the *consolamentum*. They devoted themselves to contemplation and were expected to maintain the highest moral standards. The believers were not expected to attain the standards of the perfect.

The Cathar doctrines of creation led them to rewrite the biblical story; they devised an elaborate mythology to replace it. They viewed much of the Old Testament with reserve; some of them rejected it altogether. The orthodox doctrine of the Incarnation was rejected. Jesus was merely an angel; his human sufferings and death were an illusion. They also severely criticized the worldliness and corruption of the Catholic Church.

The Cathar doctrines struck at the roots of orthodox Christianity and of the political institutions of Christendom, and the authorities of church and state united to attack them. Pope Innocent III (1198–1216) attempted to force Raymond VI, count of Toulouse, to join him in putting down the heresy, but this ended in disaster; the papal legate was murdered in January 1208, and the Count was generally thought to have been an accessory to the crime. A crusade—the Albigensian Crusade—was proclaimed against the heretics, and an army led by a group of barons from northern France proceeded to ravage Toulouse and Provence and massacre the inhabitants, both Cathar and Catholic (see Albigenses). A more orderly persecution sanctioned by St. Louis IX, in alliance with the nascent Inquisition, was more effective in breaking the power of the Cathari. In 1244 the great fortress of Montségur near the Pyrenees, a stronghold of the perfect, was captured and destroyed. The Cathari had to go underground, and many of the French Cathari fled to Italy, where persecution was more intermittent. The hierarchy faded out in the 1270s; the heresy lingered through the 14th century and finally disappeared early in the 15th.

catharsis, in criticism, metaphor used by Aristotle in the *Poetics* to describe the effects of true tragedy on the spectator. The use is derived from the medical term *katharsis* (Greek: "purgation" or "purification"). Aristotle states that the purpose of tragedy is to arouse "terror and pity" and thereby effect the catharsis of these emotions. His exact meaning has been the subject of critical debate over the centuries. The German dramatist and literary critic Gotthold Lessing (1729–81) held that catharsis converts excess emotions into virtuous dispositions. Other critics see tragedy as a moral lesson in which the fear and pity excited by the tragic hero's fate serve to warn the spectator not to similarly tempt provi-

dence. The interpretation generally accepted is that through experiencing fear vicariously in a controlled situation, the spectator's own anxieties are directed outward, and, through sympathetic identification with the tragic protagonist, his insight and outlook are enlarged. Tragedy then has a healthful and humanizing effect on the spectator or reader.

Cathay, name by which North China was known in medieval Europe. The word is derived from *Khitay* (or *Khitan*), the name of a seminomadic people who left southeastern Mongolia in the 10th century AD to conquer part of Manchuria and northern China, which they held for about 200 years. By the time of Genghis Khan (died 1227), the Mongols had begun referring to North China as *Kitai* and South China as *Mangi*. *Kitai* is still the Russian word for China.

Either Muslim merchants or two Franciscan friars who visited the ancient Mongol capital of Karakorum in 1246 and 1254 are thought to have introduced the name Cathay to Europe. But Marco Polo (1254–1324), who journeyed to China almost 50 years later, was the one who really put the image of Cathay before the European public. His descriptions of a Cathay that possessed a far more sophisticated culture and technology than the contemporary West were circulated throughout medieval Europe. Following the collapse of Mongol power in the 14th century, European contact with China was lost, but stories of the country persisted. Christopher Columbus and John Cabot thought they were heading toward Cathay in their voyages to the New World. In fact Columbus, who had a copy of Marco Polo's book with him, believed he had reached *Mangi*, which he described as contiguous to Cathay. It was not ascertained that China and Cathay were the same place until the Spanish Augustinian friar Marin de Rade, in 1575, and the Jesuit Matteo Ricci, in 1607, recorded the fact when they proved that China could be reached by following Marco Polo's land route across Central Asia.

Cathaya, genus of evergreen coniferous trees of the family Pinaceae, containing two living species native to China and one fossil species found in Germany. Both living forms are about 20 metres (65 feet) tall and have two types of branchlets: long terminal shoots and short secondary shoots. The margins of the long, narrow leaves are fringed with tiny hairs. Both male and female cones are borne on one tree.

cathedra (Latin: "chair," or "seat"), Roman chair of heavy structure derived from the *klismos*—a lighter, more delicate chair developed by the ancient Greeks.

The cathedra was used in the early Christian basilica as a raised bishop's throne placed near the wall of the apse, behind the altar. Later, a bishop's principal church, or seat, within his diocese was designated a cathedral. The term *ex cathedra* ("from the seat, or throne") was used in Roman Catholicism to distinguish solemn pronouncements by the Pope on matters of faith or morals and therefore binding on the faithful.

cathedral, in Christian churches that have an episcopal form of church government, the church in which a residential bishop has his official seat or throne, the cathedra. Cathedral churches are of different degrees of dignity. There are cathedral churches of simple diocesan bishops, of archbishops or metropolitans, of primates, patriarchs, and, in the Roman Catholic Church, of the pope. A cathedral church is not necessarily large and magnificent, although most cathedrals have become so. Since the territorial organization of the early church followed that of the Roman Em-

pire, cathedrals from the first were established wherever possible in towns, not in villages. In the early European Middle Ages, the town in which a cathedral church was situated became known as the cathedral city.

In the Roman Catholic church, canon law makes no architectural conditions for a cathedral. The only canonical requirement is that a cathedral should be consecrated and adequately endowed. The pope has the right to designate a cathedral, although the choice of the bishop of the diocese or his decision to build a cathedral is normally approved by the pope. The bishop must be present in his cathedral on certain holy days, and he must normally perform ordinations there.

In the Eastern Orthodox church the cathedral is the main church in a city where the bishop resides and where he celebrates the liturgy on festival occasions. In Russia, where the dioceses have always been few and have covered a vast area, the main church in any large town became known as a cathedral (*sobor*), even though no bishop was in residence there. The principal church of a big monastery also assumed the same name.

After the 16th-century Protestant Reformation, cathedrals where bishops were rejected became simple churches. In Sweden the cathedral continued to be the seat of the Lutheran bishop. In the Church of England, where the order of bishops was retained, the cathedrals remained as the seat of the bishop.

cathedral school, medieval European school run by cathedral clergy. Originally the function of such schools was to train priests, but later they taught lay students as well—usually boys of noble families being prepared for high positions in church, state, or commercial affairs. Every cathedral had such a school; there were generally fewer than 100 students in a school. Notable cathedral schools during the early European Middle Ages (late 8th and early 9th centuries) were at York, North Yorkshire, Eng.; Orléans, Fr.; and Reims, Fr.

Cather, Willa (Sibert) (b. Dec. 7, 1873, Winchester, Va., U.S.—d. April 24, 1947, New York, N.Y.), American novelist noted for her portrayals of the settlers and frontier life on the American plains.

Willa Cather

Courtesy of the New York Historical Society, New York City

At nine Cather moved with her family from Virginia to the Nebraska village of Red Cloud. There she grew up among the immigrants from Europe—Swedes, Bohemians, Russians, Germans—who were breaking the land on the Great Plains.

At the University of Nebraska she showed a marked talent for journalism and story writing, and on graduating in 1895 she obtained a position on a Pittsburgh "family" magazine. Later she worked as copy editor and music and drama editor of the *Pittsburgh Leader*. She turned to teaching in 1901 and in 1903 pub-

lished her first book of verses, *April Twilights*. In 1905 her first collection of short stories, *The Troll Garden*, led to her appointment as managing editor of *McClure's*, the New York muckraking monthly. After building up its declining circulation, she left in 1912 to devote herself wholly to writing novels.

Cather's first novel, *Alexander's Bridge* (1912), was a factitious story of cosmopolitan life. Under the influence of Sarah Orne Jewett's regionalism, however, she turned to her familiar Nebraska material. With *O Pioneers!* (1913) and *My Antonia* (1918), which has frequently been adjudged her finest achievement, she found her characteristic themes—the spirit and courage of the frontier she had known in her youth. *One of Ours* (1922), which won the Pulitzer Prize, and *A Lost Lady* (1923) mourned the passing of the pioneer spirit.

In her earlier *Song of the Lark* (1915), as well as in the tales assembled in *Youth and the Bright Medusa* (1920), with its story of a neurotic boy in "Paul's Case," and *Lucy Gayheart* (1935), Cather reflected the other side of her experience—the struggle of a talent to emerge from the constricting life of the prairies and the stifling effects of small-town life.

A mature statement of both themes can be found in *Obscure Destinies* (1932). With success and middle age, however, Cather experienced a strong disillusionment, which was reflected in *The Professor's House* (1925) and her essays *Not Under Forty* (1936).

Her solution was to write of the pioneer spirit of another age, that of the French Catholic missionaries in the Southwest in *Death Comes for the Archbishop* (1927) and of the French Canadians at Quebec in *Shadows on the Rock* (1931). Her last novel, *Sapphira and the Slave Girl* (1940), marked a return to the Virginia of her ancestors and her childhood.

BIBLIOGRAPHY. Phyllis C. Robinson, *Willa, the Life of Willa Cather* (1983), is a traditional biography. Biographies with analyses of her works include Sharon O'Brien, *Willa Cather: The Emerging Voice* (1987); Hermione Lee, *Willa Cather: A Life Saved Up* (1989); and James Woodress, *Willa Cather: A Literary Life* (1987). Critical interpretations are Philip Gerber, *Willa Cather* (1975); Dorothy Tuck McFarland, *Willa Cather* (1972, reprinted 1984); Marilyn Arnold, *Willa Cather's Short Fiction* (1984); and David Stouck, *Willa Cather's Imagination* (1975).

Catherine I, Russian in full YEKATERINA ALEKSEYEVNA, original name MARTA SKOWRONSKA (b. April 15 [April 5, Old Style], 1684—d. May 17 [May 6], 1727, St. Petersburg, Russia), peasant woman of Baltic (probably Lithuanian) birth who became the second wife of Peter I the Great (reigned 1682–1725) and empress of Russia (1725–27).

Orphaned at the age of three, Marta Skowronska was raised by a Lutheran pastor in Marienburg (modern Alūksne, Latvia). When the Russians seized Marienburg (1702) during the Great Northern War, Marta was taken prisoner. She later was handed over to a close adviser of Peter I. A short time later she and the tsar became lovers.

In 1703, after the birth of their first child, she was received into the Russian Orthodox church and rechristened Catherine (Yekaterina) Alekseyevna. Subsequently, she became Peter's inseparable companion, and, in February 1712, his wife. On May 18 (May 7), 1724, she was crowned empress-consort of Russia.

When Peter died (Feb. 8 [Jan. 28], 1725) without naming an heir, Catherine's candidacy for the throne was supported by the guards and by several powerful and important individuals. As a result, the Holy Synod, the Senate, and the high officials of the land almost immediately proclaimed Catherine empress of Russia. In February 1726, however, she created the Supreme Privy Council, named six of Peter's former advisers as its members, and effectively transferred control of government affairs to it, thereby undermining the author-

ity of the Senate and the Synod, which had been Peter's main administrative instruments.

Shortly before her death, Catherine appointed Peter's grandson Pyotr Alekseyevich (reigned as Peter II; 1727–30) as her heir. Later, her daughter Elizabeth (reigned 1741–62) and her grandson Pyotr Fyodorovich (reigned as Peter III; 1762) became Russia's sovereigns.

Catherine II, Russian in full YEKATERINA ALEKSEYEVNA, byname CATHERINE THE GREAT, Russian YEKATERINA VELIKAYA, original name SOPHIE FRIEDERIKE AUGUSTE, PRINZESSIN (princess) VON ANHALT-ZERBST (b. May 2 [April 21, Old Style], 1729, Stettin, Prussia [now Szczecin, Pol.]—d. Nov. 17 [Nov. 6], 1796, Tsarskoye Selo, near St. Petersburg, Russia), German-born empress of Russia (1762–96), who led her country into full participation in the political and cultural

life of Europe, carrying on the work begun by Peter the Great. With her ministers she reorganized the administration and law of the Russian Empire and extended Russian territory, adding the Crimea and much of Poland.

Origins and early experience. Sophie Friederike Auguste von Anhalt-Zerbst was the daughter of an obscure German prince, Christian August von Anhalt-Zerbst, but she was related through her mother to the dukes of Holstein. At the age of 14 she was chosen to be the wife of Karl Ulrich, duke of Holstein-Gottorp, grandson of Peter the Great and heir to the throne of Russia as the Grand Duke Peter. In 1744 Catherine arrived in Russia, assumed the title of Grand Duchess Catherine Alekseyevna, and married her young cousin the following year. The marriage was a complete failure; the following 18 years were filled with deception and humiliation for her.

Russia at the time was ruled by Peter the Great's daughter, the empress Elizabeth, whose 20-year reign greatly stabilized the monarchy. Devoted to much pleasure and luxury and

greatly desirous of giving her court the brilliancy of a European court, Elizabeth prepared the way for Catherine.

Catherine, however, would not have become empress if her husband had been at all normal. He was extremely neurotic, rebellious, obstinate, perhaps impotent, nearly alcoholic, and, most seriously, a fanatical worshipper of Frederick II of Prussia, the foe of the empress Elizabeth. Catherine, by contrast, was clear-headed and ambitious. Her intelligence, flexibility of character, and love of Russia gained her much support.

She was humiliated, bored, and regarded with suspicion while at court, but she found comfort in reading extensively and in preparing herself for her future role as sovereign. Although a woman of little beauty, Catherine possessed considerable charm, a lively intelligence, and extraordinary energy. During her husband's lifetime alone, she had at least three lovers; if her hints are to be believed, none of her three children, not even the heir apparent Paul, was fathered by her husband. Her true passion, however, was ambition; since Peter was incapable of ruling, she saw quite early the possibility of eliminating him and governing Russia herself.

The empress Elizabeth died on Jan. 5, 1762 (Dec. 25, 1761, O.S.), while Russia, allied with Austria and France, was engaged in the Seven Years' War against Prussia. Shortly after Elizabeth's death, Peter, now emperor, ended Russia's participation in the war and concluded an alliance with Frederick II of Prussia. He made no attempt to hide his hatred of Russia and his love of his native Germany; discrediting himself endlessly by his foolish actions, he also prepared to rid himself of his wife. Catherine had only to strike: she had the support of the army, especially the regiments at St. Petersburg, where Grigory Orlov, her lover, was stationed; the court; and public opinion in both capitals (Moscow and St. Petersburg). She was also supported by the "enlightened" elements of aristocratic society, since she was known for her liberal opinions and admired as one of the most cultivated persons in Russia. On July 9 (June 28, O.S.), 1762, she led the regiments that had rallied to her cause into St. Petersburg and had herself proclaimed empress and autocrat in the Kazan Cathedral. Peter III abdicated and was assassinated eight days later. Although Catherine probably did not order the murder of Peter, it was committed by her supporters, and public opinion held her responsible. In September 1762, she was crowned with great ceremony in Moscow, the ancient capital of the tsars, and began a reign that was to span 34 years as empress of Russia under the title of Catherine II.

Early years as empress. Despite Catherine's personal weaknesses, she was above all a ruler. Truly dedicated to her adopted country, she intended to make Russia a prosperous and powerful state. Since her early days in Russia she had dreamed of establishing a reign of order and justice, of spreading education, creating a court to rival Versailles, and developing a national culture that would be more than an imitation of French models. Her projects obviously were too numerous to carry out, even if she could have given her full attention to them.

Her most pressing practical problem, however, was to replenish the state treasury, which was empty when Elizabeth died; this she did in 1762 by secularizing the property of the clergy, who owned one-third of the land and serfs in Russia. The Russian clergy was reduced to a group of state-paid functionaries, losing what little power had been left to it by the reforms of Peter the Great. Since her coup d'état and Peter's suspicious death demanded both discretion and stability in her dealings with other nations, she continued to preserve friendly relations with Prussia, Rus-

sia's old enemy, as well as with the country's traditional allies, France and Austria. In 1764 she resolved the problem of Poland, a kingdom lacking definite boundaries and coveted by three neighbouring powers, by installing one of her old lovers, Stanislaw Poniatowski, a weak man entirely devoted to her, as king of Poland.

Her attempts at reform, however, were less than satisfying. A disciple of the English and French liberal philosophers, she saw very quickly that the reforms advocated by Montesquieu or Jean-Jacques Rousseau, which were difficult enough to put into practice in Europe, did not at all correspond to the realities of an anarchic and backward Russia. In 1767 she convened a commission composed of delegates from all the provinces and from all social classes (except the serfs) for the purpose of ascertaining the true wishes of her people and framing a constitution. The debates went on for months and came to nothing. Catherine's Instruction to the commission was a draft of a constitution and a code of laws. It was considered too liberal for publication in France and remained a dead letter in Russia.

Frustrated in her attempts at reform, Catherine seized the pretext of war with Turkey in 1768 to change her policy; henceforth, emphasis would be placed above all on national grandeur. Since the reign of Peter the Great, the Ottoman Empire had been the traditional enemy of Russia; inevitably, the war fired the patriotism and zeal of Catherine's subjects. Although the naval victory at Çeşme in 1770 brought military glory to the Empress, Turkey had not yet been defeated and continued fighting. At that point, Russia encountered unforeseen difficulties.

First, a terrible plague broke out in Moscow; along with the hardships imposed by the war, it created a climate of disaffection and popular agitation. In 1773 Yemelyan Pugachov, a former officer of the Don Cossacks, pretending to be the dead emperor Peter III, incited the greatest uprising of Russian history prior to the revolution of 1917. Starting in the Ural region, the movement spread rapidly through the vast southeastern provinces, and in June 1774 Pugachov's Cossack troops prepared to march on Moscow. At this point, the war with Turkey ended in a Russian victory, and Catherine sent her crack troops to crush the rebellion. Defeated and captured, Pugachov was beheaded in 1775, but the terror and chaos he inspired were not soon forgotten. Catherine now realized that for her the people were more to be feared than pitied, and that, rather than freeing them, she must tighten their bonds.

Before her accession to power, Catherine had planned to emancipate the serfs, on whom the economy of Russia, which was 95 percent agricultural, was based. The serf was the property of the master, and the fortune of a noble was evaluated not in lands but in the "souls" he owned. When confronted with the realities of power, however, Catherine saw very quickly that emancipation of the serfs would never be tolerated by the owners, whom she depended upon for support, and who would throw the country into disorder once they lost their own means of support. Reconciling herself to an unavoidable evil without much difficulty, Catherine turned her attention to organizing and strengthening a system that she herself had condemned as inhuman. She imposed serfdom on the Ukrainians who had until then been free. By distributing the so-called crown lands to her favourites and ministers, she worsened the lot of the peasants, who had enjoyed a certain autonomy. At the end of her reign, there was scarcely a free peasant left in Russia, and, because of more systematized control, the condition of the serf was worse than it had been before Catherine's rule.

Thus, 95 percent of the Russian people did not in any way benefit directly from the

achievements of Catherine's reign. Rather, their forced labour financed the immense expenditures required for her ever-growing economic, military, and cultural projects. In these undertakings, at least, she proved herself to be a good administrator and could claim that the blood and sweat of the people had not been wasted.

Influence of Potemkin. In 1774, the year of Russia's defeat of Turkey, Grigory Potemkin, who had distinguished himself in the war, became Catherine's lover, and a brilliant career began for this official of the minor nobility, whose intelligence and abilities were equalled only by his ambition. He was to be the only one of Catherine's favourites to play an extensive political role. Ordinarily, the Empress did not mix business and pleasure; her ministers were almost always selected for their abilities. In Potemkin she found an extraordinary man whom she could love and respect and with whom she could share her power. As minister he had unlimited powers, even after the end of their liaison, which lasted only two years. Potemkin must be given part of the credit for the somewhat extravagant splendour of Catherine's reign. He had a conception of grandeur that escaped the rather pedestrian German princess, and he understood the effect it produced on the people. A great dreamer, he was avid for territories to conquer and provinces to populate; an experienced diplomat with a knowledge of Russia that Catherine had not yet acquired and as audacious as Catherine was methodical, Potemkin was treated as an equal by the Empress up to the time of his death in 1791. They complemented and understood each other, and the ambitious minister expressed his respect for his sovereign through complete devotion to her interests.

The annexation of the Crimea from the Turks in 1783 was Potemkin's work. Through that annexation and the acquisition of the territories of the Crimean khanate, which extended from the Caucasus Mountains to the Bug River in southwestern Russia, Russia held the north shore of the Black Sea and was in a position to threaten the existence of the Ottoman Empire and to establish a foothold in the Mediterranean. Catherine also sought to renew the alliance with Austria, Turkey's neighbour and enemy, and renounced the alliance with Prussia and England, who were alarmed by Russian ambitions. Yet, during Catherine's reign, the country did not become involved in a European war, because the Empress scrupulously adhered to the territorial agreements she had concluded with several western European nations.

Catherine's glorification reached its climax in a voyage to the Crimea arranged by Potemkin in 1787. In a festive Arabian Nights atmosphere, the Empress crossed the country to take possession of her new provinces; the Emperor of Austria, the King of Poland, and innumerable diplomats came to honour her and to enjoy the splendours of what became known as "Cleopatra's fleet," because Catherine and her court travelled partly by water. She dedicated new towns bearing her name and announced that she ultimately intended to proceed to Constantinople.

Effects of the French Revolution. Catherine, like all the crowned heads of Europe, felt seriously threatened by the French Revolution. The divine right of royalty and the aristocracy was being questioned, and Catherine, although a "friend of the Enlightenment," had no intention of relinquishing her own privileges: "I am an aristocrat, it is my profession." In 1790 the writer A.N. Radishchev, who attempted to publish a work openly critical of the abuses of serfdom, was tried, condemned to death, then pardoned and exiled. Ironically, the sentiments Radishchev expressed were very sim-

ilar to Catherine's Instruction of 1767. Next, Poland, encouraged by the example of France, began agitating for a liberal constitution. In 1792, under the pretext of forestalling the threat of revolution, Catherine sent in troops and the next year annexed most of the western Ukraine, while Prussia helped itself to large territories of western Poland. After the national uprising led by Tadeusz Kościuszko in 1794, Catherine wiped Poland off the map of Europe by dividing it between Russia, Prussia, and Austria in 1795.

Catherine's last years were darkened by the execution of Louis XVI, the advance of the revolutionary armies, and the spread of radical ideas. The Empress realized, moreover, that she had no suitable successor. She considered her son Paul an incompetent and unbalanced man; her grandson Alexander was too young yet to rule.

Assessment. Russians, even Soviet Russians, continue to admire Catherine, the German, the usurper and profligate, and regard her as a source of national pride. Non-Russian opinion of Catherine is less favourable. Because Russia under her rule grew strong enough to threaten the other great powers, and because she was in fact a harsh and unscrupulous ruler, she figured in the Western imagination as the incarnation of the immense, backward, yet forbidding country she ruled. One of Catherine's principal glories is to have been a woman who, just as Elizabeth I of England and Queen Victoria gave their names to periods of history, became synonymous with a decisive epoch in the development of her country.

At the end of Catherine's reign, Russia had expanded westward and southward over an area of more than 200,000 square miles, and the Russian rulers' ancient dream of access to the Bosphorus Strait (connecting the Black Sea with the Aegean) had become an attainable goal. At the end of her reign Catherine claimed that she had reorganized 29 provinces under her administrative reform plan. An uninhibited spender, she invested funds in many projects. More than a hundred new towns were built; old ones were expanded and renovated. As commodities were plentiful, trade expanded and communications developed. These achievements, together with the glory of military victories and the fame of a brilliant court, to which the greatest minds of Europe were drawn, have won her a distinguished place in history.

Catherine's critics acknowledge her energy and administrative ability but point out that the achievements of her reign were as much due to her associates and to the unaided, historical development of Russian society as to the merits of the Empress. And when they judge Catherine the woman, they treat her severely.

Her private life was admittedly not exemplary. She had young lovers up to the time of her unexpected death from a stroke at the age of 67. After the end of her liaison with Potemkin, who perhaps was her morganatic husband, the official favourite changed at least a dozen times; she chose handsome and insignificant young men, who were only, as one of them himself said, "kept girls." Although in reality devoted to power above all else, she dreamed endlessly of the joys of a shared love, but her position isolated her. She did not love her son Paul, the legitimate heir, whose throne she occupied. On the other hand, she adored her grandsons, particularly the eldest, Alexander, whom she wished to succeed her. In her friendships she was loyal and generous and usually showed mercy toward her enemies.

Yet it cannot be denied that she was also egotistical, pretentious, and extremely domineering, above all a woman of action, capable

of being ruthless when her own interest or that of the state was at stake. As she grew older she also became extremely vain: there was some excuse, as the most distinguished minds of Europe heaped flatteries on her that even she ultimately found exaggerated.

A friend of Voltaire and Diderot, she carried on an extensive correspondence with most of the important personages of her time. She was a patron of literature and a promoter of Russian culture; she herself wrote, established literary reviews, encouraged the sciences, and founded schools. Her interests and enthusiasms ranged from construction projects to lawmaking and the collection of art objects; she touched on everything, not always happily but always passionately. She was a woman of elemental energy and intellectual curiosity, desiring to create as well as to control.

(Z.O.)

BIBLIOGRAPHY. *Primary sources.* *Mémoires de Catherine II*, ed. by Dominique Maroger (1953; Eng. trans. 1955), is of great importance for the history of Catherine's beginnings and for an analysis of her character. This edition is not complete, but it constitutes a choice made among the various versions of the autobiography begun by Catherine; all versions stop very near to the date of her accession to power. Equally important are the *Correspondance* of Catherine II with Voltaire (published in various editions of the complete works of Voltaire, as well as in the Evdokimov edition of the complete works of Catherine II, 1893); the *Correspondance avec le Baron F.M. Grimm (1774-1796)*, Grot edition (1878), is interesting for its autobiographical character; Grimm was Catherine's confidant. See also *Lettres d'amour de Catherine II à Potemkine*, Georges Oudard edition (1934), which unfortunately is edited without chronological order.

Works about Catherine II and her reign. V.A. Bilbassov, *Geschichte Katharina II*, 3 vol. (1891-93; also published in French as *Histoire de Catherine II*, 1900), is the most important work written about Catherine II, with quotations from many documents of the period; the last volume was banned in Russia under the tsarist regime. Ian Grey, *Catherine the Great: Autocrat and Empress of All Russia* (1961), a remarkable work, is a penetrating analysis of Catherine's character and notably of her relationships with Potemkin. Olga Wormser, *Catherine II* (1957; in French), is particularly interesting for its analysis of the social and cultural situation in Russia. Z. Oldenbourg, *Catherine de Russie* (1964; in French), is a work devoted primarily to the first half of Catherine's life.

Catherine, SAINT, also called SAINT CATHERINE DEI RICCI, original name ALESSANDRA DEI RICCI (b. April 23, 1522, Florence—d. Feb. 2, 1590, Prato, Rep. of Florence; canonized 1746; feast day February 13), Italian Dominican mystic. At the age of 13 she entered the Dominican convent at Prato, becoming prioress from 1560 to 1590. Famous for her visions of the Passion and her stigmatization, she was the author of letters (ed. by Fr. Sisto of Pisa, 1912) and other minor works.

*Articles are alphabetized word by word,
not letter by letter*

Catherine DE MÉDICIS, Italian CATERINA DE' MEDICI (b. April 13, 1519, Florence—d. Jan. 5, 1589, Blois, Fr.), queen consort of Henry II of France (reigned 1547-59) and subsequently regent of France (1560-74), who was one of the most influential personalities of the Catholic-Huguenot wars. Three of her sons were kings of France: Francis II, Charles IX, and Henry III.

Early life. Catherine was the daughter of Lorenzo de' Medici, duke of Urbino, and Madeleine de La Tour d'Auvergne, a Bourbon princess related to many of the French nobility. Orphaned within days, Catherine was highly educated, trained, and disciplined by nuns in Florence and Rome and married in 1533 by

Catherine de Médicis, portrait by an unknown artist, 1561; in the Bibliothèque Nationale, Paris

Giraudon—Art Resource/EB Inc

her uncle, Pope Clement VII, to Henry, duc d'Orléans, who inherited the French crown from his father, Francis I, in April 1547. Artistic, energetic, and introverted, as well as discreet, courageous, and gay, Catherine was greatly esteemed at the dazzling court of Francis I, from which she derived both her political attitudes and her passion for building. Of the chateaux she designed herself—including the Tuileries—Chenonceaux was her unfinished masterpiece.

In spite of Henry's abiding attachment to his mistress Diane de Poitiers, Catherine's marriage was not unsuccessful and, after 10 anxious years, she bore him 10 children, of whom 4 boys and 3 girls survived. She herself supervised their education. Thus occupied, Catherine lived privately though she was appointed regent in 1552 during Henry's absence at the siege of Metz. Her ability and eloquence were acclaimed after the Spanish victory of Saint-Quentin in Picardy in 1557, possibly the origin of her perpetual fear of Spain, which remained, through changing circumstances, the touchstone of her judgments. It is essential to understand this in order to discern the coherence of her career.

Political crises. Catherine's first great political crisis came in July 1559 upon the accidental death of Henry II, a traumatic bereavement from which it is doubtful that she ever recovered. Under her son, Francis II, power was retained by the Guise brothers. Thus began her lifelong struggle—explicit in her correspondence—with these extremists who, supported by Spain and the papacy, sought to dominate the crown and extinguish its independence in the commingled interests of European Catholicism and personal aggrandizement. It is also necessary to understand this political struggle of the Catholic crown with its own ultramontane extremists and to perceive its fluctuations in changing circumstances, in order to realize the fundamental consistency of Catherine's career. Her essentially moderate influence was first perceptible during the Conspiracy of Amboise (March 1560), an instance of tumultuous petitioning by the Huguenot gentry, primarily against Guisard persecution in the name of the King. Her merciful Edict of Amboise (March 1560) was followed in May by that of Romorantin, which distinguished heresy from sedition, thereby detaching faith from allegiance.

Catherine's second great political crisis came with the premature death on Dec. 5, 1560, of Francis II, whose royal authority the Guises had monopolized. Catherine succeeded in obtaining the regency for Charles IX, with Antoine de Bourbon, king of Navarre and first prince of the blood, as lieutenant general, to whom the Protestants vainly looked for leadership.

Civil wars. The 10 years from 1560 to 1570 were, politically, the most important of

Catherine's life. They witnessed the first three civil wars and her desperate struggle against the Catholic extremists for the independence of the crown, the maintenance of peace, and the enforcement of limited toleration. In 1561, with the support of the distinguished chancellor Michel de L'Hospital, she began by trying to propitiate the leaders of both religious factions, to effect reforms and economies by unassailably traditional methods, and to settle the religious conflict. Religious reconciliation was the conveners' purpose of the Colloquy of Poissy (September–November 1561). Catherine appointed a mixed commission of moderates that devised two formulas of consummate ambiguity, by which they hoped to resolve the basic, Eucharist controversy. Possibly Catherine's most concrete achievement was the Edict of January 1562, which followed the failure of reconciliation. This afforded the Calvinists licensed coexistence with specific safeguards. Unlike the proposals of Poissy, the edict was law, which the Protestants accepted and the Catholics rejected. This rejection was one basic element in the outbreak of civil war in 1562, in which—as she had predicted—Catherine fell, politically, into the clutches of the extremists, because the Catholic crown might protect its Protestant subjects in law but could not defend them in arms. Thenceforth the problem of religion was one of power, public order, and administration.

Catherine ended the first civil war in March 1563 by the Edict of Amboise, an attenuated version of the Edict of January. In August 1563 she declared the King of age in the Parlement of Rouen and, from April 1564 to January 1566, conducted him on a marathon itinerary round France. Its principal purpose was to execute the edict and, through a meeting at Bayonne in June 1565, to seek to strengthen peaceful relations between the crown and Spain and to negotiate for Charles's marriage to Elizabeth of Austria. During the period 1564–68, Catherine was unable, for complex reasons, to withstand the cardinal Lorraine, statesman of the Guises, who largely provoked the second and third civil wars. She quickly terminated the second (September 1567–March 1568) with the Peace of Longjumeau, a renewal of Amboise. But she was unable to avert its revocation (August 1568), which heralded the third civil war. She was not primarily responsible for the more far-reaching Treaty of Saint-Germain (August 1570), but she succeeded in disgracing the Guises.

For the next two years Catherine's policy was one of peace and general reconciliation. This she envisaged, in terms of the marriage of her daughter Marguerite to the young Protestant leader, Henry of Navarre (later Henry IV of France), and alliance with England through the marriage of her son Henry, duc d'Anjou, or, failing him, his younger brother François, duc d'Alençon, to Queen Elizabeth. The complexity of Catherine's position during these years cannot be briefly explained. To some extent she was eclipsed by Louis of Nassau and a group of Flemish exiles and youthful Protestants who surrounded the King and urged him to make war upon Spain in the Netherlands, which Catherine inevitably resisted.

The Massacre of St. Bartholomew's Day. The issue of war or peace in the Netherlands was closely linked with the Massacre of St. Bartholomew's Day in Paris on Aug. 23–24, 1572. Upon this occasion, following an abortive attempt against the life of the admiral Gaspard de Coligny, he and a number of his principal lieutenants, together with several thousand Huguenots, were killed. Catherine traditionally has been blamed for these events, which have therefore fashioned the interpretation not only of her subsequent, but frequently also of her previous, career, resulting in the familiar myth of the wicked Italian queen. There are two principal reasons for this. First,

after some hesitation and inconsistency, the King assumed the responsibility by a declaration of August 26 in the Parlement of Paris, and "the crown" has been taken to mean Catherine. The second reason for the traditional inculpation of Catherine is the work of the pamphleteers and the polemical nature of the historiography of the event. It is impossible to establish the origin of the assault upon Coligny, but, as a member of the court—the royal family and the council—Catherine was among those who appear to have authorized not the massacre itself but the death of the admiral and his principal followers. This and the subsequent royal declaration of August 26 are both explained by the danger of the situation—after the unsuccessful assault upon Coligny—in which the infuriated Huguenots allegedly threatened the court with extinction and the kingdom with war.

Last years. After the Massacre of St. Bartholomew's Day, Catherine was more concerned with the election of Anjou to the throne of Poland (May 1573) than the prosecution of the fourth civil war. Upon the death of Charles IX a year later, she assumed the regency with the support of the Parlement until the return from Poland of Henry III in August. Catherine placed high hopes in her favourite, Henry, for the regeneration of France, for which she longed, but not without simultaneous misgivings, knowing his weakness of character and his previous subjection to the Catholics. For these reasons Catherine neither sought to dominate Henry nor to rule in his place but rather suffered him to exploit her and strove with unremitting pains to supply his deficiencies. Until the death of Alençon in 1584, much of her attention was devoted to restraining his dangerous ambitions, which again threatened to involve France in hostilities with Spain. After the Treaty of Joinville (December 1584) between the Guises and Spain, at Henry's bidding, Catherine, though gravely ill, returned to this dual threat. But after three months of continuous effort, in order to avert a public breach between the crown and the Guises, she was obliged, by the Treaty of Nemours (July 1585), to commit the King to making war against the Huguenots. Having failed with the Guises, the crown turned to Navarre, the Protestant leader who, as heir presumptive, had an interest in the preservation of the throne. In July 1586 Catherine undertook the arduous journey to see him at Saint-Brice near Cognac. But there was nothing to which Navarre could safely commit himself. Thus, despite the heroic efforts of Catherine's old age, France was sinking into chaos when she died at Blois eight months before the murder of Henry III. Nevertheless, her ultimate achievement was to have saved the kingdom just long enough to ensure the succession of the Bourbon Henry IV, by whom the royal authority was restored. (N.M.Su.)

(1880–1909), with valuable introductions; Lucien Romier, *Le Royaume de Catherine de Médicis*, 2nd ed., 2 vol. (1922), for background analysis; N.M. Sutherland, *The Massacre of St. Bartholomew and the European Conflict 1559–1572* (1972), distinguishes the role of Catherine from that of the King and the Cardinal of Lorraine; Paul Van Dyke, *Catherine de Médicis*, 2 vol. (1922), an old-fashioned account of Catherine's life and times.

Catherine HOWARD (d. Feb. 13, 1542, London), fifth wife of King Henry VIII of England. Her downfall came when Henry learned of her premarital affairs.

Catherine was one of 10 children of Lord Edmund Howard (died 1539), a poverty-stricken younger son of Thomas Howard, 2nd duke of Norfolk. Henry VIII first became attracted to the young girl in 1540, when he was seeking to end his politically motivated marriage to Anne of Cleves, to whom Catherine was a

maid of honour. He had his marriage to Anne annulled on July 9, and on July 28 Henry and Catherine were privately married. He publicly acknowledged her as queen on August 8.

For the next 14 months Henry appeared to be much enamoured of his bride. But in November 1541, he learned that before their marriage Catherine had had affairs: Henry Mannock, a music teacher; Francis Dereham, who had called her his wife; and her cousin, Thomas Culpepper, to whom she had been engaged. After her marriage to Henry, Catherine had made Dereham her secretary, and it is probable—though still unproved—that she had committed adultery with Culpepper.

The King, initially incredulous, became incensed with these revelations. On Feb. 11, 1542, Parliament passed a bill of attainder declaring it treason for an unchaste woman to marry the king. Two days later Catherine was beheaded in the Tower of London. Her life is recounted in Lacey Baldwin Smith's *A Tudor Tragedy* (1961).

Catherine OF ALEXANDRIA, SAINT (d. c. early 4th century, Alexandria, Egypt; feast day November 25), one of the most popular early Christian martyrs. She is not mentioned before the 9th century, and her historicity is doubtful. According to the legend, she was an ex-

St. Catherine of Alexandria, detail from "The Mystic Marriage of St. Catherine," by Filippino Lippi; in the Church of S. Domenico, Bologna, Italy

Alinari—Art Resource/EB Inc

remely learned young girl of noble birth who protested the persecution of Christians under the Roman emperor Maxentius—whose wife and several soldiers she converted—and defeated the most eminent scholars summoned by Maxentius to oppose her. The spiked wheel (whence the term catherine wheel) by which she was sentenced to be killed broke, and she was then beheaded.

After her death angels allegedly took her body to Mt. Sinai, where it was discovered c. 800. In the Middle Ages, when the story of her mystical marriage to Christ was widely circulated, she was one of the most popular saints. She is the patron of philosophers and scholars. St. Joan of Arc claimed that Catherine's was among the heavenly voices that spoke to her. In 1969 her feast day was removed from the church calendar.

Catherine OF ARAGON (b. Dec. 16, 1485, Alcalá de Henares, Spain—d. Jan. 7, 1536, Kimbolton, Huntingdon, Eng.), first wife of King Henry VIII of England (reigned 1509–47). The refusal of Pope Clement VII to annul Henry's marriage to Catherine triggered the break between Henry and Rome and led to the English Reformation.

Catherine was the youngest daughter of the Spanish rulers Ferdinand II of Aragon and Isabella I of Castile. In 1501 she married Prince Arthur, eldest son of King Henry VII of England. Arthur died the following year, and

shortly afterward she was betrothed to Prince Henry, the second son of Henry VII. But subsequent rivalry between England and Spain and Ferdinand's refusal to pay the full dowry prevented the marriage from taking place until her fiancé assumed the throne as Henry VIII in 1509. For some years the couple lived happily. Catherine matched the breadth of her husband's intellectual interests, and she was a competent regent while he was campaigning against the French (1512–14).

Catherine of Aragon, detail of an oil painting by an unknown artist; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Between 1510 and 1518 Catherine gave birth to six children, including two sons, but all except Mary (later queen of England, 1553–58) either were stillborn or died in early infancy. Henry's desire for a legitimate male heir prompted him in 1527 to appeal to Rome for an annulment on the grounds that the marriage had violated the biblical prohibition against a union between a man and his brother's widow. Catherine appealed to Pope Clement VII, contending that her marriage to Henry was valid because the previous marriage to Arthur had never been consummated.

For seven years the Pope avoided issuing the annulment because he could not alienate Catherine's nephew, the Holy Roman emperor Charles V. Finally Henry separated from Catherine in July 1531. On May 23, 1533—five months after he married Anne Boleyn—he had his own archbishop of Canterbury, Thomas Cranmer, annul the marriage to Catherine. Parliament passed the Act of Supremacy repudiating all papal jurisdiction in England and making the king head of the English church. Although Catherine had always been loved by the English people, Henry forced her to spend her last years isolated from all public life. Garrett Mattingly's *Catherine of Aragon* (1942) is the standard biography.

Catherine OF BOLOGNA, SAINT, original name CATERINA VIGRI (b. Sept. 8, 1413, Bologna, Papal States—d. March 9, 1463, Bologna; canonized 1712; feast day March 9), Italian mystic and writer whose spiritual writings were popular in Italy until the end of the 18th century.

Of noble birth, Catherine was educated at the Este court at Ferrara and entered the order in 1432. In 1456 she founded in Bologna a convent of Poor Clares, serving as abbess until her death. Throughout her life Catherine claimed to have visions and revelations. Her chief work is considered to be *Le sette arme necessarie alla battaglia spirituale* (composed in 1438; Eng. trans. by A.G. McDougall, *The Spiritual Armour*, 1926).

Catherine OF BRAGANZA (b. Nov. 25, 1638, Vila Viçosa, Port.—d. Dec. 31, 1705, Lisbon), Portuguese Roman Catholic wife of King Charles II of England (ruled 1660–85). A pawn in diplomatic dealings and anti-papal intrigues, she was married to Charles as part

of an important alliance between England and Portugal.

Catherine's father became King John IV of Portugal in 1640. Her marriage, which took place in May 1662, brought England valuable trading privileges and the port cities of Tangier (in Morocco) and Bombay. In return, England pledged to help Portugal maintain its independence from Spain.

The young queen had little personal charm, and, despite her deep affection for Charles, he paid less attention to her than to his mistresses. When it became apparent that she would bear the King no children, opponents of his brother, James, duke of York, urged him to divorce her in the hope that Charles could then be induced to wed a Protestant. In 1678 they accused Catherine of scheming to poison the King and place his Roman Catholic brother James on the throne. But Charles, who never doubted his wife's innocence, stood by her until she was cleared of the charges. Catherine helped convert Charles to the Roman Catholic Church shortly before he died in 1685, and in 1692 she returned to Portugal. In 1704 she became regent of Portugal for her ailing brother, King Pedro II.

Catherine OF GENOA, SAINT, original name CATERINA FIESCHI (b. 1447, Genoa—d. Sept. 15, 1510; canonized 1737; feast day September 15), Italian mystic admired for her work among the sick and the poor.

Catherine was born into a distinguished family and received a careful education. Her early aspirations to become a nun were frustrated by an arranged marriage to Giuliano Adorno. After several years of unhappiness she led a life of pleasure for a time but was converted by a mystical experience in 1473, which marked the beginning of her life of close union with God. This she combined with assiduous service to the sick in a hospital at Genoa, in which her husband joined her after he, too, had been converted.

St. Catherine's two works, the *Trattato del Purgatorio* and the *Dialogo*, are the outcome of her mystical life. Her authorship of these has been denied, but according to Umile Bonzi a large part of both works is her own, though they received their final form only after her death. They were first printed, together with her biography, in 1551.

Catherine OF SIENA, SAINT, original name CATERINA BENINCASA (b. March 25, 1347, Siena, Tuscany—d. April 29, 1380, Rome; canonized 1461; feast day April 29), Dominican tertiary, mystic, and patron saint of Italy who played a major role in returning the papacy from Avignon to Rome (1377). She was declared a doctor of the church in 1970.

Catherine became a tertiary (a member of a monastic third order who takes simple vows and may remain outside a convent or monastery) of the Dominican order (1363), joining the Sisters of Penitence of St. Dominic in Siena. She rapidly gained a wide reputation for her holiness and her severe asceticism. When the rebellious city of Florence was placed under an interdict by Pope Gregory XI (1376), Catherine determined to take public action for peace within the church and Italy and to encourage a crusade against the Muslims. She went as an unofficial mediator to Avignon with her confessor and biographer Raymond of Capua. Her mission failed, and she was virtually ignored by the Pope, but while at Avignon she promoted her plans for a crusade.

It became clear to her that the return of Pope Gregory XI to Rome—an idea that she did not initiate and had not strongly encouraged—was the only way to bring peace to Italy and thus facilitate a crusade. Catherine left for Tuscany the day after Gregory set out for Rome (1376). At his request she went to Florence (1378) and was there during the Ciompi Revolt in June. After a short final

stay in Siena, during which she completed her *Dialogo* (begun the previous year), she went to Rome in November, probably at the invitation of Pope Urban VI, whom she helped in reorganizing the church. From Rome she sent out letters and exhortations to gain support for Urban; as one of her last efforts she tried to win back Queen Joan I of Naples to obedience to Urban, who had excommunicated the Queen for supporting the antipope Clement VII.

Catherine's writings, all of which were dictated, include about 380 letters, 26 prayers, and the four treatises of *Il libro della divina dottrina* ("The Dialogue of Saint Catherine"), better known as the *Dialogo* (c. 1475; Eng. trans. by A.L. Thorold, 1925). The record of her ecstatic experiences in the *Dialogo* illustrates her doctrine of the "inner cell" of the knowledge of God and of self into which she withdrew. A complete edition of Catherine's works together with her biography by Raymond was published in Siena (1707–21). Alice Curtayne's *Saint Catherine of Siena* appeared in 1929.

Catherine OF SWEDEN, SAINT, Swedish SANKTA KATARINA, original name KATARINA ULFSDOTTER (b. 1331/32, Sweden—d. March 24, 1381, Vadstena; feast day March 24), daughter of St. Bridget of Sweden, whom she succeeded as superior of the Brigittines.

Catherine was married to Egard Lydersson von Kyren, who died shortly after she left for Rome (1350) to join Bridget as her constant companion. She did not return to Sweden until after Bridget's death in 1373. She took part in the ecclesiastical controversies of her time, supported Pope Urban VI against the antipope Clement VII, and promoted the canonization of Bridget. She was abbess of Vadstena when she died. She was never formally canonized but is listed in the Roman martyrology.

Catherine PARR (b. 1512—d. Sept. 7, 1548), sixth and last wife of King Henry VIII of England (ruled 1509–47).

She was a daughter of Sir Thomas Parr of Kendall, an official of the royal household. Catherine had been widowed twice—in mar-

Catherine Parr, detail of a portrait panel attributed to W. Scrots, c. 1545; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

riages to Edward Borough (died c. 1529) and to John Neville, Lord Latimer (died 1542 or 1543)—by the time she married Henry on July 12, 1543.

Her tactfulness enabled her to exert a beneficial influence on the King during the last years of his reign. She developed close friendships with the three children Henry had by previous marriages and devoted herself to their education. A Humanist, she was friendly with Protestant reformers. Timely access to the King saved her from conservatives, especially Stephen Gardiner, who were bent on her destruction in 1546.

After Henry's death in January 1547 she married a former suitor, Thomas, Lord Seymour of Sudeley, who was admiral of England from 1547 to 1549, but she died shortly after giv-

ing birth to a daughter. A learned and deeply religious woman, she wrote *A Lamentacion or Complaynt of a Sinner* in the last year of her life.

Catherine THE GREAT: see Catherine II.

Catherine the Great, Instruction of, Russian NAKAZ YEKATERINY VELIKOY (Aug. 10 [July 30, old style], 1767), in Russian history, document prepared by Empress Catherine II that recommended liberal, humanitarian political theories for use as the basis of government reform and the formulation of a new legal code. The Instruction was written as a guide for a legislative commission that was intended to consider internal reforms and to devise a new code of laws.

The Instruction generally favoured the creation of a society of free individuals acting in accordance with the law. It maintained that all men should be considered equal before the law; that law should protect the populace, not oppress it; and that law should forbid only acts directly harmful to an individual or the community, leaving the people free to do anything not forbidden. It disapproved of capital punishment, torture, and the perpetuation of serfdom. But it also upheld the principle of absolutism in government, insisting that all political power was derived from the autocrat, who was subject to no law.

The Instruction had little impact within Russia. When the legislative commission adjourned (December 1768), it had neither prepared a legal code nor agreed upon measures for restructuring the government; and Catherine made no further efforts to create legislation to implement her principles. The Instruction did serve, however, as a major stimulus to Russian political thought.

cathode, negative terminal or electrode through which electrons enter a direct current load, such as an electrolytic cell or an electron tube, and the positive terminal of a battery or other source of electrical energy through which they return. This terminal corresponds in electrochemistry to the terminal at which reduction occurs. Within a gas discharge tube, electrons travel away from the cathode, but positive ions (current carriers) travel toward the cathode. *Compare* anode.

cathode ray, stream of electrons leaving the negative electrode (cathode) in a discharge tube containing a gas at low pressure, or electrons emitted by a heated filament in certain electron tubes. Cathode rays focused on a hard target (anticathode) produce X rays or focused on a small object in a vacuum generate very high temperatures (cathode-ray furnace). Cathode rays cause phosphors to luminesce. This effect, when coupled with the controlled deflection of a cathode ray by electric or magnetic fields, gives rise to the cathode-ray oscilloscope (cathode-ray tube) for monitoring variations and values of an alternating voltage or current and to the picture tube of television and radar. Electrons emitted by radioactive nuclei are known as β -rays.

cathode-ray oscilloscope, electronic display device containing a cathode-ray tube (CRT), used to produce visible patterns that are the graphical representations of electrical signals. The graphs plot the relationships between two or more variables, with the horizontal axis normally being a function of time and the vertical axis usually a function of the voltage generated by the input signal to the oscilloscope. Because almost any physical phenomenon can be converted into a corresponding electric voltage, the oscilloscope is a versatile tool in all forms of physical investigation.

Speed of response is the cathode-ray oscilloscope's chief advantage over other plotting devices. General-purpose oscilloscopes have plotting frequencies of up to 100 megahertz (mHz). Response times as rapid as 2,000 mHz

are achievable with special-purpose, high-speed oscilloscopes.

The central component in this device, the cathode-ray tube, consists of an evacuated glass container with a phosphorescent coating at one end (similar to that of a television screen) and an electron gun and system for focusing and deflecting the beam of electrons at the other. The electron beam emerging from the electron gun passes between pairs of metal plates mounted in such a way that they deflect the beam horizontally and vertically to control the production of a luminous pattern on the screen. The screen image is a visual representation of the voltages applied to the deflection plates. Alternatively, the beam may be deflected magnetically by varying the currents through externally mounted deflection coils. Thus, almost any graph can be plotted on the screen by generating horizontal and vertical deflection voltages or currents proportional to the lengths, velocities, or other quantities being observed.

It is sometimes necessary or desirable to plot more than one waveform at the same time on the screen of an oscilloscope. Using a variety of techniques, four or more plots can be simultaneously shown. With a dual-trace amplifier and a single CRT gun, two signals may be shown at what appears to be the same time. Actually, the amplifier electronically switches rapidly between the two observed signals. In a split-beam CRT the electron beam from a single gun is split, with the two parts receiving different vertical deflections. A dual-gun CRT uses two separate electron guns, each having its own focus and brightness controls. By combining two dual-trace amplifiers with a dual-gun CRT, four individual plots can be obtained.

The cathode-ray oscilloscope is one of the most widely used test instruments; its commercial, engineering, and scientific applications include acoustic research, television-production engineering, and electronics design.

catholic (from Greek *katholikos*, "universal"), the characteristic that, according to ecclesiastical writers since the 2nd century, distinguished the Christian Church at large from local communities or from heretical and schismatic sects. A notable exposition of the term as it had developed during the first three centuries of Christianity was given by St. Cyril of Jerusalem in his *Catecheses* (348): the church is called catholic on the ground of its worldwide extension, its doctrinal completeness, its adaptation to the needs of men of every kind, and its moral and spiritual perfection.

The theory that what has been universally taught or practiced is true was first fully developed by St. Augustine in his controversy with the Donatists (a North African heretical Christian sect) concerning the nature of the church and its ministry. It received classic expression in a paragraph by St. Vincent of Lérins in his *Commonitoria* (434), from which is derived the formula: "What all men have at all times and everywhere believed must be regarded as true." St. Vincent maintained that the true faith was that which the church professed throughout the world in agreement with antiquity and the consensus of distinguished theological opinion in former generations. Thus, the term catholic tended to acquire the sense of orthodox.

Some confusion in the use of the term has been inevitable, because various groups that have been condemned by the Roman Catholic Church as heretical or schismatic never retreated from their own claim to catholicity. Not only the Roman Catholic Church but also the Eastern Orthodox Church, the Anglican Church, and a variety of national and other churches claim to be members of the holy catholic church, as do most of the major Protestant churches.

Catholic Action, the organized work of the laity that is performed under the direction or mandate of a bishop in the fields of dogma, morals, liturgy, education, and charity. In 1927 Pope Pius XI gave the term its classical definition as "the participation of the laity in the apostolate of the hierarchy."

A distinction is normally made between general and specialized Catholic Action. General Catholic Action organizations, such as the Holy Name Society or the Legion of Mary, are open to all Roman Catholics, or at least all of a given age. Specialized Catholic Action groups are limited to members of a given profession or interest group, such as workers, students, doctors, lawyers, or married couples. The most famous of the specialized groups is the Jocists (*Jeunesse Ouvrière Chrétienne*; in English-speaking nations called the Young Christian Workers), founded in Belgium after World War I as an organized association of factory workers by Father (later Cardinal) Joseph Cardijn.

Besides Catholic Action in the strict sense, in which it is conceived as an extension of the hierarchy, there is the broader notion of the lay apostolate, which involves the more autonomous activity of the laity in the temporal society to bring a Christian influence to their environment. It is this latter notion, which gives greater recognition to the responsibility of the laity, that has been emphasized since the second Vatican Council (1962-65).

Catholic Emancipation, in British history, the freedom from discrimination and civil disabilities granted to the Roman Catholics of Britain and Ireland in a series of laws during the late 18th and early 19th centuries. After the Reformation, Roman Catholics in Britain had been harassed by numerous restrictions. In Britain, Roman Catholics could not purchase land, hold civil or military offices or seats in Parliament, inherit property, or practice their religion freely without incurring civil penalties. A Roman Catholic in Ireland could not vote in Parliamentary elections and could be readily dispossessed of his land by his nearest Protestant relative.

By the late 18th century, however, Roman Catholics had ceased to be considered the social and political danger that they had represented at the beginning of the Hanoverian succession. The first Relief Act (1778) enabled Roman Catholics in Britain to acquire real property, such as land. Similar legislation was enacted in Ireland in a series of measures (1774, 1778, and 1782). In 1791 another bill was passed that enabled British Catholics to practice their religion without fear of civil penalties, a measure applied on a much wider scale by the Irish Parliament with the Relief Act of 1793, which granted Irish Roman Catholics the franchise and admission to most civil offices.

Further emancipatory measures following the Act of Union (1801), which united Great Britain with Ireland, foundered in the face of resistance from the bitterly anti-Catholic George III and from powerful Irish Protestants and British Tories who feared Roman Catholic participation in Britain's public life. In the next two decades, however, the charismatic Irish lawyer and orator Daniel O'Connell began to mobilize the Irish Roman Catholic peasantry and middle class to agitate for full emancipation. He formed the Catholic Association to this end in 1823, bringing into its ranks hundreds of thousands of members in Ireland. By 1828 the British government was faced with the threat of a nationwide rebellion in Ireland if action was not taken to conciliate this broad-based and energetic movement intent on the alleviation of Catholic grievances. O'Connell himself forced the issue when he

entered a Parliamentary by-election in County Clare in 1828, insisting that he would not take his seat until the anti-Roman Catholic oath required of members of Parliament was abolished. O'Connell's ensuing triumphant election compelled the British prime minister, the Duke of Wellington, and Sir Robert Peel to carry the Emancipation Act of 1829 in Parliament. This act admitted Irish and English Roman Catholics to Parliament and to all but a handful of public offices. With the Universities Tests Act of 1871, which opened the universities to Roman Catholics, Catholic Emancipation in the United Kingdom was virtually complete.

Catholic League, German KATHOLISCHE LIGA, a military alliance (1609–35) of the Catholic powers of Germany led by Maximilian I, duke of Bavaria, and designed to stem the growth of Protestantism in Germany. In alliance with the Habsburg emperors, the League's forces, led by Johann Tserclaes, Graf von Tilly, played a key role in the Thirty Years' War.

Plans for a league had long been discussed, but the formation of the Protestant Union in 1608 caused the Catholics to unite under Maximilian. The original League members on July 10, 1609, included Bavaria; the prince-bishops of Bavaria, Franconia, and Swabia; and the Rhenish ecclesiastical electors of Mainz, Trier, and Cologne. Maximilian reorganized the League in 1617, excluding the Rhenish members and making the League an exclusively southern German confederation.

When the Protestant elector Frederick V of the Palatinate accepted the Bohemian crown in 1619, the Holy Roman emperor Ferdinand II looked to the League for military support. Through negotiations in 1620, Maximilian undermined the Protestant Union's support of Frederick. In November 1620, the League's forces under Tilly crushed Frederick at the Battle of White Mountain near Prague. Tilly's troops then ravaged the Palatinate and other Protestant lands to the north; won several battles over King Christian IV of Denmark, who had come to the Protestants' defense; and helped carry out Catholic restitutions in conquered Protestant territories. The importance of the League began to decline after 1626, when the Emperor found his own general in Albrecht von Wallenstein. Tilly's defeat by Gustav II Adolf of Sweden at Breitenfeld in 1631, followed by his death the following year, accelerated the League's decline. It was abolished in 1635 by the Peace of Prague, which forbade military confederations in the Empire.

Catholic Reformation (church history): *see* Counter-Reformation.

Catholicism: *see* Roman Catholicism.

catholicos, Greek KATHOLIKOS ("universal" bishop), in Eastern Christian Churches, title of certain ecclesiastical superiors. In earlier times the designation had occasionally been used, like archimandrite and exarch, for a superior abbot; but the title eventually came to denote a bishop who, while head of a major church, was still in some way dependent on his patriarch. The titles catholicos and patriarch later became synonymous and were both applied to the heads of the Armenian, Nestorian (Assyrian), and Georgian churches. The title catholicos patriarch is also used by the primates of the Armenian Catholic Church and the Chaldean Church.

Catiline, Latin in full LUCIUS SERGIUS CATILINA (b. c. 108 BC—d. 62 BC, Pistoria, Etruria), in the late Roman Republic, an aristocrat who turned demagogue and made an unsuccessful attempt to overthrow the republic while Cicero was a consul (63).

Catiline served under Pompey's father in the Social War of 89 and acquired an unsavoury reputation as a zealous participant in Sulla's proscriptions, killing his own brother-in-law during them. He became praetor in 68 and governor of the province of Africa in 67–66. Because Catiline was then under prosecution for extortion, a charge of which he was eventually acquitted, he could not stand for the consular elections of 65 or 64. In 64 he failed to be elected consul when Cicero was one of the successful candidates, and a year later he was again defeated for that office. Upon this last defeat, Catiline began to systematically enlist a body of supporters with which to stage an armed insurrection and seize control of the government. His proposals for the cancellation of debt and the proscription of wealthy citizens and his general championship of the poor and oppressed appealed to many discontented elements within Roman society.

Cicero, who was consul in 63, was kept fully informed of the growing conspiracy by his network of spies and informers, but he felt unable to act against the still-popular and well-connected Catiline. On October 21, however, Cicero denounced Catiline to the Senate in an impassioned speech, charging him with treason and obtaining from the Senate the "ultimate decree," in effect a proclamation of martial law. Catiline withdrew from Rome on November 8 and joined his army of destitute veterans and other supporters that had been collected at Faesulae in Etruria. After Cicero saw a number of signed documents that unmistakably proved a conspiracy's existence, several suspects were arrested and were executed on December 5 by decree of the Senate. The Senate also mobilized the republic's armies to take the field against Catiline's forces. Catiline, assuming charge of the army at Faesulae, attempted to cross the Apennines into Gaul in January 62 but was engaged by a republican army under Gaius Antonius Hybrida at Pistoria. Catiline and most of his followers were killed.

cation, atom or group of atoms that bears a positive electric charge. *See* ion.

Catlett, Elizabeth (b. April 15, 1919, Washington, D.C., U.S.), expatriate American sculptor and printmaker renowned for her intensely political art.

The granddaughter of slaves, Catlett was born into a middle-class Washington family. Disallowed entrance into the Carnegie Institute of Technology because she was black, Catlett enrolled at Howard University (B.A., c. 1936), where she studied art. While working as

a muralist for two months during the mid-1930s with the Federal Art Project of the Works Progress Administration, she became influenced by the social activism of Mexican muralist Diego Rivera.

In 1940 Catlett became the first student to earn a master's degree of fine arts in sculpture at the University of Iowa, where she studied under the regionalist painter Grant Wood. After holding several teaching positions and continuing to expand her range of media, Catlett went to Mexico City in 1946 to work at the Taller de Gráfica Popular, an artists' collective. There, along with her then-husband, the artist Charles White, she created prints depicting Mexican life. As a left-wing activist, she endured investigation by the House Un-American Activities Committee during the 1950s. About 1962 she took Mexican citizenship.

Catlett is known largely for her sculpture, especially for works such as *Homage to My Young Black Sisters* (1968) and various mother-child pairings, the latter of which became one of her central themes. She was also an accomplished printmaker who valued prints for their affordability and hence their accessibility to many people. Catlett alternately chose to illustrate famous subjects, such as Harriet Tubman and Malcolm X, and anonymous workers—notably strong, solitary black women.

Catlin, George (b. July 26, 1796, Wilkes-Barre, Pa., U.S.—d. Dec. 23, 1872, Jersey City, N.J.), American artist and author, whose paintings of American Indian scenes are an invaluable record of those vanished cultures.

Catlin practiced law for a short time but in 1823 turned to portrait painting, in which he was self-taught. He had been interested in Indian life from his boyhood, and in 1829 he became determined to record their way of life before their heritage disappeared under the onslaught of the advancing American frontier. He began a series of visits to various tribes, chiefly in the Great Plains. He made more than 500 paintings and sketches based on his observations during his travels and exhibited these works in the United States and Europe from 1837 to 1845 as the "Gallery of Indians." In 1841 he published his best known book, the two-volume *Letters and Notes on the Manners, Customs, and Condition of the North American Indians*, which was illustrated with many engravings. Catlin traveled to Central and South America from 1852 to 1857, adding sketches to his collection, and then he lived in Europe between 1858 and 1870.

The bulk of the Catlin collection, which is mainly of ethnographic and historical interest,

"Comanche Mounted War Party," oil on canvas by George Catlin, 1834; in the National Museum of American Art, Washington, D.C.

By courtesy of the National Museum of American Art (formerly National Collection of Fine Arts), Smithsonian Institution, Washington, D.C., gift of Mrs. Sarah Harrison

was acquired by the Smithsonian Institution in 1879. His other published works include *Catlin's North American Indian Portfolio: Hunting Scenes and Amusements of the Rocky Mountains and Prairies of America* (1845); *Catlin's Notes of Eight Years' Travels and Residence in Europe* (1848); *Life Amongst the Indians* (1867); and *Last Rambles Amongst the Indians of the Rocky Mountains and the Andes* (1867).

catnip, also called **CATMINT** (*Nepeta cataria*), aromatic herb of the mint family (Lamiaceae, or Labiatae). The plant has spikes of small,

Catnip (*Nepeta cataria*)

Walter Chandoha

purple-dotted flowers. Catnip has been used as a seasoning and as a medicinal tea for colds and fever. Because its mintlike flavour and aroma are particularly exciting to cats, it is often used as a stuffing for cat playthings.

Cato, Marcus Porcius, byname **CATO THE CENSOR**, or **CATO THE ELDER** (b. 234 BC, Tusculum, Latium [Italy]—d. 149), Roman statesman, orator, and the first Latin prose writer of importance. He was noted for his conservative and anti-Hellenic policies, in opposition to the phil-Hellenic ideals of the Scipio family.

Cato was born of plebeian stock and fought as a military tribune in the Second Punic War. His oratorical and legal skills and his rigid morality attracted the notice of the patrician Lucius Valerius Flaccus, who helped him begin a political career at Rome. Cato was elected quaestor (205), aedile (199), and praetor (198) in Sardinia, where he suppressed usury. He was elected consul with Flaccus in 195, and as consul he unsuccessfully opposed the repeal of a measure restricting female extravagance (*Lex Oppia*). Then, in an extensive and bitter military campaign, he stamped out an insurrection in Spain and organized the province of Nearer Spain. In 191 Cato served with distinction under Manius Acilius Glabrio at Thermopylae in the war against the Seleucid king Antiochus III. Shortly thereafter he included Glabrio in his denunciation of the supporters of the Scipios. He then attacked Lucius Scipio and Scipio Africanus the Elder and broke their political influence. This success was followed by his election to the censorship in 184, again with Flaccus as his colleague. (The censors were twin magistrates who acted as census takers, assessors, and inspectors of morals and conduct.)

As censor Cato aimed at preserving the *mos majorum* ("ancestral custom") and combating all Greek influences, which he believed were undermining older Roman standards of morality. He passed measures taxing luxury and strictly revised the list of persons eligible for the Senate. He checked abuses by the tax gatherers, and he promoted much public building, including the Basilica Porta (the

first market hall in Rome). Cato's censorship impressed later generations but was too reactionary; his anti-Hellenic policies, in particular, were retrograde and lacked wide support. His sternness as censor made him so many enemies that he later had to defend himself 44 times against various accusations and attempted prosecutions.

After his term as censor, Cato continued to preach his social doctrines and to support such measures as the *Lex Orchia* against luxury (181) and the *Lex Voconia* (169), which checked the financial freedom of women. In his later years he turned to capitalistic farming, speculation, and moneylending on a considerable scale. His embassy to Carthage (probably 153) convinced him that the revived prosperity of Rome's old enemy constituted a new threat. Cato constantly repeated his admonition "Carthage must be destroyed" ("Delenda est Carthago"), and he lived to see war declared on Carthage in 149.

Cato's dislike of luxury and ostentation partly explains his deep hatred of the Scipio family. He himself affected rustic manners and speech, though he was witty and deeply learned. Cato's influence on the growth of Latin literature was immense. He was the author of *Origines*, the first history of Rome composed in Latin. This work, of whose seven books only a few fragments survive, related the traditions of the founding of Rome and other Italian cities. Cato's only surviving work is *De agri cultura* (*On Farming*), a treatise on agriculture written about 160 BC. *De agri cultura* is the oldest remaining complete prose work in Latin. It is a practical handbook dealing with the cultivation of grape vines and olives and the grazing of livestock, but it also contains many details of old customs and superstitions. More important, it affords a wealth of information on the transition from small landholdings to capitalistic farming in Latium and Campania. Cato also compiled an encyclopaedia and *Praecepta* ("Maxims") for his son, in addition to works on medicine, jurisprudence, and military science. Of at least 150 speeches he published, only meagre fragments of about 80 survive.

Cato, Marcus Porcius, byname **CATO THE YOUNGER** (b. 95 BC—d. 46, Utica, Africa [now in Tunisia]), great-grandson of Cato the Censor and a leader of the Optimates (conservative senatorial aristocracy) who tried to preserve the Roman Republic against power seekers, in particular Julius Caesar.

On the death of his parents, Cato was brought up in the house of his uncle Marcus Livius Drusus (tribune in 91). He served in the ranks against the insurgent slave Spartacus in 72 and was military tribune in Macedonia (67) and quaestor (perhaps in 64) before obtaining a provincial appointment in Asia. As tribune-designate for 62, he incurred the resentment of Caesar by voting to execute the Catilinarian conspirators. Cato's opposition to Pompey, Caesar, and Marcus Licinius Crassus helped to bring about their coalition in the so-called First Triumvirate (60). With the Optimate Calpurnius Bibulus, Cato attempted unsuccessfully to obstruct Caesar's agrarian legislation. He was sent to annex Cyprus (58), but upon his return in 56 he continued to struggle against the Triumvirate.

Failing to obtain the consulship of 51, Cato had decided to retire from public life when civil war (Caesar against Pompey and the Optimates, 49–45) broke out. Cato realized that the sole chance to preserve the republic lay in supporting Pompey, whom he had formerly opposed. He was entrusted with the defense of Sicily but found it impossible to hold the island and joined Pompey at Dyrrhachium. After Pompey's defeat at Pharsalus (in Thessaly), Cato led a small remnant of troops to Africa. He shut himself up in Utica, and even after the decisive defeat of the republican

forces at Thapsus (46), he was determined to keep the gates closed until he had evacuated his adherents by sea. When the last transports had left, Cato committed suicide.

Although Cato was a doctrinaire and obstructionist politician, he provided the Optimates with relatively honest leadership in a corrupt age. His only surviving composition is a letter to Cicero (preserved in Cicero's *Ad familiares*, xv, 5). Immediately after his death Cato's character became the subject of debate. Cicero's panegyric *Cato* was answered by Caesar's bitter *Anticato*. In the *Bellum civile* by the poet Lucan (1st century AD), Cato is represented as a model of virtue.

Cato, Publius Valerius (fl. 1st century BC), Roman poet and grammarian, the leader of the "new" school of poetry (*poetae novi*, as Cicero called them). Its followers rejected the national epic and drama in favour of the short mythological epics (*epyllia*), elegies, and lyrics of the Alexandrian school. The compliments paid to Cato's verse by contemporary poets bear witness to his preeminence.

According to the biographer and antiquarian Suetonius, Cato was a native of Cisalpine Gaul who lost his property during a period of civil disturbances. He lived to a great age and at the end of his life was very poor. Nothing is known of his grammatical treatises. Of his poems, two titles survive: the "Lydia" and the "Diana."

Catoche, Cape, Spanish **CABO CATOCHE**, cape on the Caribbean Sea, on a bar off the Mexican state of Quintana Roo, in the north-eastern part of the Yucatán Peninsula (*q.v.*). Cape Catoche is said to have been the first Mexican land visited by Spaniards, in 1517. It is separated from western Cuba, approximately 150 miles (240 km) to the east, by the Yucatán Channel.

Caton-Thompson, Gertrude (b. Feb. 1, 1889, London, Eng.—d. April 18, 1985, Broadway, Hereford and Worcester), English archaeologist who distinguished two prehistoric cultures in the Al-Fayyūm depression of Upper Egypt, the older dating to about 5000 BC and the younger to about 4500 BC.

While a student at the British School of Archaeology in Egypt (1921–26), Caton-Thompson and Elinor Wight Gardner began the first archaeological survey of the Al-Fayyūm depression (1924–26 and 1927–28). In Southern Rhodesia (1928–29) she directed stratigraphic studies of the Zimbabwe architectural remains that pointed to indigenous African design and construction during the time of the European Middle Ages. Her findings, controverting a popular view that the ruins were the remains of biblical Ophir and of Phoenician origin, were reported in *The Zimbabwe Culture* (1931; reissued in 1969). Returning to Egypt (1930–33), she conducted excavations in Al-Wāhāt al-Khārijah (the Kharga oasis). A fellow of Newnham College, Cambridge (1934–51), in 1948 she advanced the hypothesis that earliest civilization may have originated in central Africa. Her other publications included *The Desert Fayum* (1935) and *Kharga Oasis in Prehistory* (1952).

Catonsville, village, Baltimore county, north-central Maryland, U.S., a southwestern suburb of Baltimore. It was founded before 1729 and was known as Johnnyeake after a local inn specializing in that type of cornbread. The present name, honouring Richard Caton, was adopted about 1800. A residential community with light industry, Catonsville is the seat of Catonsville Community College (1956). The Baltimore County Campus (1963) of the University of Maryland and Patapsco Valley State Park are nearby. In 1968 a group of citizens burned the records of the local draft

board in protest against the war in Vietnam and became known as the Catonsville Nine; their subsequent trial, imprisonment, and parole received worldwide publicity. Pop. (1990) 35,233.

Catron, John (b. 1786?, Wythe County, Va.?, U.S.—d. May 30, 1865, Nashville, Tenn.), associate justice of the United States Supreme Court (1837–65).

After moving from Kentucky to Tennessee in 1812 and serving under General Andrew Jackson in the War of 1812, Catron studied law and was admitted to the bar in 1815. Until 1818 he practiced on a "mountain circuit" in Tennessee and became its prosecuting attorney. He became highly versed in the land law, then the major source of litigation, and built up a lucrative practice in Nashville. In 1824 the state Supreme Court of Last Resort (later called the Supreme Court of Errors and Appeals) was enlarged, and Catron was elected to it by the legislature. In his most famous decision on this court he disbarred a lawyer for duelling and denounced the practice. In 1831, in a judicial reorganization, Catron became Tennessee's first chief justice.

After a new constitution abolished his court in 1834, Catron took up private practice and politics. An ardent supporter of President Andrew Jackson, Catron directed the Tennessee campaign of Jackson's protégé, Martin Van Buren, in 1836. The day before Jackson's retirement from the presidency, Congress passed an act enlarging the U.S. Supreme Court; and, on his last day in office, Jackson appointed Catron to one of the new vacancies. Although a capable justice, Catron decided no major cases and generally cast his vote with Chief Justice Roger B. Taney, also a Jacksonian politically.

In 1848 he strongly opposed secession and set out on his circuit duties in hopes of both maintaining the authority of the United States and using his influence to prevent his home state from seceding. Such action was too late. He was forced to leave Tennessee for his own safety and was able to hold his Kentucky court during the war only with military assistance.

Catroux, Georges (b. Jan. 29, 1877, Limoges, Fr.—d. Dec. 21, 1969, Paris), French general and diplomat, one of the highest-ranking officers in the Free French government of World War II.

A graduate of the military academy at Saint-Cyr, Catroux served in World War I and then in various posts in the French colonial empire. Appointed governor-general of Indochina in 1939, he was dismissed by the Vichy government in 1940 and joined General Charles de Gaulle's Free French movement. As representative of the Free French in the Middle East, he proclaimed the independence of Syria and Lebanon in 1941. In 1943–44 he was governor-general of Algeria and in 1944 minister for North Africa in the French provisional government. He served as French ambassador to the Soviet Union in 1945–48.

Cats, Jacob, Jacob also spelled JACOBUS (b. Nov. 10, 1577, Brouwershaven, Zeeland, Spanish Netherlands [now in The Netherlands]—d. Sept. 12, 1660, Zorgh-vliet, near The Hague), Dutch writer of emblem books and didactic verse whose place in the affections of his countrymen is shown by his nickname, "Father Cats."

Cats took his doctor's degree in law at Orléans, practiced at The Hague, and, after visits to Oxford and Cambridge, settled in Zeeland, where he accumulated wealth by land reclamation. Becoming a magistrate, he was successively pensionary of Middelburg and Dordrecht and, from 1636 to 1651, grand pensionary of Holland. He took part in diplomatic

missions to England—in 1627 to Charles I and in 1651–52, unsuccessfully, to Cromwell. His background gave him an international outlook, and he was in sympathy with many of the English Puritan writers.

Cats was primarily a writer of poetic emblem books, a type of literature popular in the 17th century that consisted of woodcuts or engrav-

Cats, oil painting by M.J. van Mierevelt, 1634; in the Rijksmuseum, Amsterdam

By courtesy of the Rijksmuseum, Amsterdam

ings accompanied by verses pointing a moral. He used this form to express the major ethical concerns of early Dutch Calvinists, especially those dealing with love and marriage. By being the first to combine emblem literature with love poetry, and by his skill as a storyteller, he achieved enormous popularity. The sources on which he draws are chiefly the Bible and the classics and occasionally Boccaccio and Cervantes.

His first book, *Sinn'-en minne-beelden* (1618), contained engravings with text in Dutch, Latin, and French. Each picture has a threefold interpretation, expressing what were for Cats the three elements of human life: love, society, and religion. Perhaps his most famous emblem book is *Spiegel van den ouden ende nieuwen Tijd* (1632), many quotations from which have become household sayings. It is written in a more homely style than his earlier works, in popular rather than classical Dutch. Two other works—*Houwelyck* (1625) and *Trou-Ringh* (1637)—are rhymed dissertations on marriage and conjugal fidelity. In one of his last books, *Ouderdom, Buytenleven en Hofgedachten op Zorgh-vliet* (1655), Cats wrote movingly about old age.

cat's-eye, any of several gemstones that, when cut *en cabochon* (in convex form, highly polished), display a luminous band reminiscent of the eye of a cat; this particular quality is termed chatoyancy. Precious, or oriental, cat's-eye, the rarest and most highly prized, is a greenish chatoyant variety of chrysoberyl called cymophane; the chatoyant effect is

Chrysoberyl cat's-eye with yellow banding on a brown stone
John H. Gerard

due to minute parallel cavities. Quartz cat's-eye, the commonest, owes its chatoyancy and grayish-green or greenish colour to parallel fibres of asbestos in the quartz; although it comes from the East, it is often called occidental cat's-eye to differentiate it from the more valuable oriental (chrysoberyl) cat's-eye. The two may be distinguished by their specific gravities; chrysoberyl is much denser. Crocidolite cat's-eye (African cat's-eye), more commonly known as tigereye (or tiger's-eye), is quartz that contains oriented fibres of crocidolite that have been replaced by silica. Corundum cat's-eye is an imperfect star sapphire or ruby in which the star is reduced to a luminous zone.

Catskill Delta, structure that was deposited in the northeastern United States during the Middle and Late Devonian Period (the Devonian Period began about 408 million years ago and lasted about 48 million years); it is named for exposures studied in the Catskill Mountains of New York. During Middle and Late Devonian time, numerous streams flowing from the Appalachian Highlands constructed a large compound delta along the northeastern regions of the United States. Late in the Devonian Period, the shoreline was pushed back to western New York and northwestern Pennsylvania. A broad coastal lowland, extending more than 320 km (200 miles) across, was formed; at the same time, the submerged portion of the delta was growing and extended into Ohio.

Catskill Game Farm, Inc., privately owned zoo opened in 1933 in Catskill, N.Y., U.S. It occupies more than 370 hectares (914 acres), of which 55 hectares (135 acres) are open to the public from April to October. The remainder of the zoo grounds is maintained as a breeding preserve. The Catskill Game Farm provides other zoos throughout the world with many varieties of captive-bred animals. The strength of its collection is a large breeding stock of rare ungulates, among which are scimitar-horned oryx, mountain zebra, and onager.

Catskill Mountains, dissected segment of the Allegheny Plateau, U.S., and part of the Appalachian system, lying mainly in Greene and Ulster counties of southeastern New York.

Catskill Mountains near Cairo, N.Y.
Pictorial Parade—EB Inc

Bounded north and east by the valleys of the Mohawk and Hudson rivers, the mountains are drained by headstreams of the Delaware River and by numerous small creeks. Many

peaks rise more than 3,000 ft (900 m) abruptly above adjacent valley floors, with the highest being Slide Mountain (4,204 ft). The northern portion along the Mohawk is called the Helderberg Hills. The much higher elevations in the Catskills compared to the surrounding area are mainly due to the durability of the top layers of sandstone and conglomerate.

The unusually steep-sided valleys and massive, rounded uplands comprise a natural wilderness within easy reach of New York City. Heavily mantled with mixed broad-leaf and needle-leaf forests, the area's scenery is made more spectacular by deeply scored cloves (rocky glens). Tourism and outdoor recreation are popular in Catskill Park (688,660 ac [278,700 ha]), which includes the state-owned Catskill Forest Preserve (250,000 ac), and in the more accessible, privately owned parts of the mountains. The artificial lakes in the Catskills include Ashokan, Downsville, Neversink, Rondout, and Schoharie reservoirs, important to the water supply of metropolitan New York. The mountains were made famous through Washington Irving's short stories about the legendary Rip Van Winkle, who supposedly took his long nap near the town of Catskill on the Hudson River at the eastern entrance to the park. The name Catskill is derived from Kaaterskill (Dutch, meaning wildcat creek), as one of the nearby better known streams is called.

catsup, also spelled **KETCHUP**, spicy liquid condiment widely used in the United States and Great Britain. U.S. catsup is a sweet puree of tomatoes, onions, and green peppers flavoured with vinegar and pickling spice that is eaten with meats, especially beef, and frequently with french fried potatoes (British chips); it is the universal condiment of fast-food sandwiches. In Britain, as formerly in the United States, catsup signifies a spicy liquid based on mushrooms, unripe walnuts, or oysters; this catsup functions primarily as a seasoning for cooking. The word derives from the Chinese *ke-tsiap*, a fish brine, probably by way of the Malaysian *ketjap*.

Catt, Carrie Chapman, *née* LANE (b. Jan. 9, 1859, Ripon, Wis., U.S.—d. March 9, 1947, New Rochelle, N.Y.), American feminist leader who led the women's rights movement for more than 25 years, culminating in the adoption of the 19th (suffrage) Amendment to the U.S. Constitution in 1920.

Carrie Chapman Catt

Courtesy of the League of Women Voters of Illinois

She was appointed high school principal in Mason City, Iowa, in 1881 and became one of the first woman school superintendents in the country two years later. Her first marriage (1884) to Leo Chapman, an editor, ended with his death in 1886. From 1887 to 1890 she devoted herself to organizing the Iowa Woman Suffrage Association. Her marriage to George W. Catt, an engineer, in 1890, was unusual in its prenuptial legal contract providing her with four months of free time each year to work exclusively for woman suffrage. George Catt encouraged and supported his wife's dedication until his death, in 1905, at which time he left

her financially independent to devote the rest of her life to reform activities.

A highly effective organizer, Catt was elected in 1900 to succeed Susan B. Anthony as president of the National American Woman Suffrage Association (NAWSA). She resigned the presidency in 1904 to care for her ailing husband. Between 1905 and 1915 Catt reorganized the NAWSA along political-district lines. By then an accomplished public speaker, she served as the group's president from 1915 until her death. In the meantime, she trained women for direct political action and marshaled seasoned campaigners.

Buoyed by the nearly \$1 million bequest of Miriam Leslie, NAWSA adopted Catt's "Winning Plan" and opened a massive drive for a constitutional suffrage amendment. The success of a second New York state referendum in 1917, followed by Pres. Woodrow Wilson's conversion to the cause of suffrage in 1918, attested to the effectiveness of her flexible strategy of working at both federal and state levels. The ratification of the 19th Amendment in August 1920 was in large part a tribute to Catt's imaginative and tactful leadership. She later reorganized the suffrage association—two million strong—into the League of Women Voters in order to work for continuing progressive legislation throughout the United States.

In the 1920s Catt embraced the peace movement, enlisting the cooperation of 11 national women's organizations in the Committee on the Cause and Cure of War (1925) to urge U.S. participation in a world organization for peace. She was also a strong advocate of international disarmament and of Prohibition. Following World War II she was keenly interested in the United Nations and used her influence to have qualified women placed on certain commissions.

Catt's works include *Woman Suffrage and Politics; The Inner Story of the Suffrage Movement* (1923, written with Nettie Rogers Shuler) and, with others, *Why Wars Must Cease* (1935).

Cattaneo, Carlo (b. June 15, 1801, Milan—d. Feb. 6, 1869, near Lugano, Switz.), Italian publicist and intellectual whose writings significantly shaped the Risorgimento and whose journal, *Il Politecnico* ("The Polytechnic"), not only served as a vehicle for his political views but also was influential in introducing new scientific and technical improvements into Italy.

During Cattaneo's early career as a schoolmaster and as a graduate in law at the University of Padua (1824), he acquired a tremendous scope of knowledge: his writings treat such diversified subjects as literature and fine arts, philosophy, language, mathematics, chemistry, geology, agriculture, and penal reform, as well as other economic, social, and political problems. Considered Italy's first proponent of positivism, he tried to clarify the complex relations between morality and economics. His scholarly work *Notizie naturali e civili su la Lombardia* (1844; "Natural and Civil Reports on Lombardy") gained him election to the prestigious Lombard Institute.

Cattaneo was slow to enter the political sphere, in which he was considered a moderate, because he believed Italy was not ready for an armed revolt against Austria, which then controlled Milan. When the Milan rebellion, "the Five Days" (March 18–22, 1848), broke out, he became one of the leaders of the revolutionary council. On the reoccupation of Milan by the Austrians in August, Cattaneo left and settled in Switzerland. He wrote two books on the revolt: *L'insurrezione di Milano nel 1848 e della successiva guerra* (1849; "On the Milan Insurrection of 1848 and on the Succeeding War").

Cattaneo returned to Milan in 1859 to re-found his journal. In 1867 he was elected to

the Chamber of Deputies of the Kingdom of Italy but never took his seat because he was unwilling to take a required oath of loyalty to the ruling House of Savoy. He continued to oppose the monarchy from his home in Switzerland.

Cattell, James McKeen (b. May 25, 1860, Easton, Pa., U.S.—d. Jan. 20, 1944, Lancaster, Pa.), American psychologist who oriented American psychology toward use of objective experimental methods, mental testing, and

James McKeen Cattell

Courtesy of Columbia University, Office of Public Information

application of psychology to the fields of education, business, industry, and advertising. He originated two professional directories and published five scientific periodicals.

After graduation from Lafayette College in Easton (1880), he went to Germany and studied with philosopher Rudolf Hermann Lotze at the University of Göttingen and with psychologist Wilhelm Wundt at the University of Leipzig. Returning to the United States, he spent 1882 and 1883 at Johns Hopkins University, Baltimore. Journeying again to Leipzig, he became Wundt's assistant and conducted investigations directed toward scientific objectivity.

After receiving a Ph.D. from Leipzig (1886), Cattell continued his research in the London laboratory of Sir Francis Galton. In 1888 he received a professorship in psychology, the first ever offered, at the University of Pennsylvania, Philadelphia. There he established a laboratory and developed a series of mental measurement tests for college students.

In 1891 Cattell became professor and administrative head of psychology at Columbia University, where he focused on improving and advancing mental testing. In 1894 he cofounded the *Psychological Review* and acquired the weekly journal *Science*, which he edited from 1894 to 1944. In 1900 he established *Popular Science Monthly*, renamed *Scientific Monthly* in 1915, which he edited through 1943. His concern with scientific eminence led him to originate, edit, and publish the directory *American Men of Science* (1906–38). Cattell was dismissed from Columbia in 1917 when he publicly criticized the draft in World War I. The remainder of his professional life was devoted principally to editing, including *The American Naturalist* (1907–44) and *School and Society* (1915–39). In 1921 he founded the Psychological Corporation in order to make research in applied psychology available to industry and business.

Cattell, Raymond B(ernard) (b. March 20, 1905, Staffordshire, Eng.—d. Feb. 2, 1998, Honolulu, Hawaii, U.S.), British-born American psychologist, considered to be one of the world's leading personality theorists.

Cattell was educated at the University of London, receiving a B.S. in 1924 and a Ph.D. in 1929. He taught at the University of Exeter (1927–32), after which he served as director of the Leicester Child Guidance

Clinic (1932–37). Cattell then taught at Clark University, Worcester, Mass. (1939–41). After a brief stint as a lecturer at Harvard University (1941–43), he was appointed research professor of psychology at the University of Illinois, Urbana (1945), a position he held until becoming emeritus professor in 1974.

Cattell was a prolific writer in the field of psychological measurement. Among his many books are *The Meaning and Measurement of Neuroticism and Anxiety* (1961), *Handbook of Multivariate Experimental Psychology* (1966), *Prediction of Achievement and Creativity* (1968), and *Abilities: Their Structure, Growth, and Action* (1971).

Personality and Learning Theory, 2 vol. (1979–80), is considered his most important work. In it he proposed a theory of human development that integrates the intellectual, temperamental, and dynamic aspects of personality in the context of environmental and cultural influences. He was able to synthesize in this work many of the disparate hypotheses of both personality and learning theories.

cattle, domesticated bovine farm animals that are raised for their meat or milk, for their hides, or for draft purposes.

A brief treatment of cattle follows. For full treatment, see MACROPAEDIA: Farming and Agricultural Technology; *Livestock farming*.

In the terminology used to describe the sex and age of cattle, the male is first a bull calf and if left intact becomes a bull; if castrated he becomes a steer and in about two or three years grows to an ox. The female is first a heifer calf, growing into a heifer and becoming a cow. Depending on the breed, mature bulls weigh 1,000–4,000 pounds (450–1,800 kg), and cows 800–2,400 pounds. Males retained for beef production are usually castrated to make them more docile on the range or in feedlots; with males intended for use as working oxen or bullocks, castration is practiced to make them more tractable at work.

All modern domestic cattle are believed to

belong to the species *Bos taurus* (European breeds such as Shorthorn and Jersey) or *Bos indicus* (zebu breeds such as Brahman) or to be crosses of these two (such as Santa Gertrudis). Many contemporary breeds are of recent origin. The definition of a breed is difficult and inexplicit, although the term is commonly used and, in practice, well understood. It may be used generally to connote animals that have been selectively bred for a long time so as to possess distinctive identity in colour, size, conformation, and function, and these or other distinguishing characteristics are perpetuated in their progeny. The major meat and dairy breeds are described in the table below. For individual breeds, see INDEX.

cattle grub: see warble fly.

cattle plague: see rinderpest.

Cattle Raid of Cooley, The, Irish Gaelic TÁIN BÓ CUAILNGE, old Irish epiclike tale, the longest of the Ulster cycle of hero tales dealing with the conflict between Ulster and Connaught over possession of the brown bull of Cooley. The tale was composed in prose with verse passages in the 7th and 8th centuries, probably by an author who was acquainted with epics such as the Latin *Aeneid*. It is partially preserved in *The Book of the Dun Cow* (c. 1100) and is also found in *The Book of Leinster* (c. 1160) and *The Yellow Book of Lecan* (late 14th century). Although it contains passages of lively narrative and witty dialogue, similar to the finest of early Irish shorter tales, it is not a coherent work of art, and its text has been marred by revisions and interpolations. It has particular value for the literary historian in that the reworkings provide a record of the degeneration of Irish style; e.g., the bare prose of the earlier passages is later replaced by bombast and alliteration, and ruthless humour becomes sentimentality.

The tale's plot is as follows. Medb (Maeve), the warrior-queen of Connaught, disputes with her husband, Ailill, over their respective wealth. Because possession of the white-horned bull guarantees Ailill's superiority, Medb resolves to secure the even more famous brown

bull of Cooley from the Ulstermen. Although Medb is warned by a propheticess of impending doom, the Connaught army proceeds to Ulster. The Ulster warriors are temporarily disabled by a curse, but Cú Chulainn, the youthful Ulster champion, is exempt from the curse and singlehandedly holds off the Connaughtmen. The climax of the fighting is a three-day combat between Cú Chulainn and Fer Díad, his friend and foster brother, who is in exile with the Connaught forces. Cú Chulainn is victorious, and, nearly dead from wounds and exhaustion, he is joined by the Ulster army, which routs the enemy. The brown bull, however, has been captured by Connaught and defeats Ailill's white-horned bull, after which peace is made.

The tale's loose construction has preserved intact a few outstanding dramatic episodes, such as Medb's dialogue with the soothsayer and Cú Chulainn's dealings with the Connaught scouts. Undoubtedly the finest section is that in which Fergus, an exile from Ulster at the Connaught court, recalls for Medb and Ailill the heroic deeds of Cú Chulainn's youth.

cattleya, any orchid plant of the genus *Cattleya* (family Orchidaceae), comprising about

Cattleya
Joyce R. Wilson

65 species of air plants or rock plants that are commercially important as ornamentals and florists' plants. They are native to tropical America and are widely grown in greenhouses and other light, humid indoor environments. Cattleyas have large pseudo-bulbs (bulblike stems), 1 or 2 leaves, and 1 to 30 large, brightly coloured flowers.

Cattleya labiata, one of the most commonly cultivated species, has been crossed with numerous other orchid genera to produce many showy hybrids.

Catton, Bruce, in full CHARLES BRUCE CATTON (b. Oct. 9, 1899, Petoskey, Mich., U.S.—d. Aug. 28, 1978, Frankfort, Mich.), American journalist and historian, noted for his books on the American Civil War.

As a child living in a small town in Michigan, Catton was stimulated by the reminiscences of the Civil War that he heard from local veterans. His education at Oberlin College, Ohio, was interrupted by two years of naval service in World War I and was subsequently abandoned for a career in journalism. While he was employed as a reporter for the *Boston American*, the *Cleveland News*, and the *Cleveland Plain Dealer* (1920–26), Catton continued his lifelong study of the Civil War period. He subsequently worked for the Newspaper Enterprise Service (1926–41) and for the U.S. War Production Board. In 1954 he became a member of the staff of *American Heritage* magazine, and from 1959 he served as its senior editor.

A commission to write a Centennial History of the Civil War evolved into Catton's celebrated trilogy on the Army of the Potomac: *Mr. Lincoln's Army* (1951); *Glory Road* (1952); and *A Stillness at Appomattox* (1953). The latter earned Catton both a Pulitzer Prize and the National Book Award in 1954.

Catton's brilliance as a historian lay in his

Breeds of domesticated cattle

name and type	distribution	appearance	characteristics
Angus, or Aberdeen-Angus (beef)	originally Scotland, now U.S., U.K.	hornless, black, compact, low-set	adapts well to varied climates
Ayrshire (dairy)	throughout temperate lands	deep, fleshy body; red or brown colour	hardy
Beefmaster (beef)	developed 1908, Texas	red, usually with white spots	breed trademarked "Lansater Beefmaster"
Brahman, or zebu (dairy and draft)	originally India, now widespread	gray with large shoulder hump	extensively crossbred
Brangus (beef)	developed in U.S., 1930s	large, black, hornless, straight back	3/8 Brahman, 5/8 Angus
Brown Swiss (dairy)	North and South America, also Europe	brown wedge-shaped body	hardy
Charbray (beef)	developed 1940s, Texas	large, horned, white	1/8–1/4 Brahman, remainder Charolais
Charolais (beef)	originally France, now Mexico and U.S.	unusually large and white	much used for cross-breeding
Droughtmaster (beef)	developed in Australia	red colour; horned or hornless	excellent tick resistance
Galloway (beef)	originally Galloway, southwest Scotland	hornless, black, compact, low-set	hardy; thrives in rigorous climate
Guernsey (dairy)	U.K., North America, Australia	fawn-coloured, white markings; short horns	excellent milk producer
Hereford, or white-face (beef)	U.K., North and South America, Australia, N.Z.	red and white; low-set and compact	popular beef breed
Highland (beef)	Scotland	small, heavy dewlap, wide horns	especially hardy
Holstein-Friesian (dairy)	North and South America, Australia, South Africa	black and white; horned or hornless	large production of milk
Jersey (dairy)	now in every cattle-raising country	small, short-horned; fawn or yellow brown	docile, uses feed efficiently
Murray Grey (beef)	originally Australia, now also N.Z., Fiji, east Asia, U.K., North America	hornless; silver to gray colour	cows milk well; docile; good rate of growth
Red Poll (beef and dairy)	North and South America, N.Z., Australia, South Africa	medium size; red colour with some white	satisfactory milk and butterfat
Santa Gertrudis (beef)	U.S., Cuba, South America, Australia	deep red colour; horned	3/8 Brahman, 5/8 Shorthorn
Shorthorn, or Durham (beef)	now in almost every cattle-raising area	horned or hornless; red or roan	calves mature rapidly for market

ability to bring to historical narrative the immediacy of reportage.

Other works by Catton include *The War Lords of Washington* (1948); *U.S. Grant and the American Military Tradition* (1954); and a second trilogy, *The Coming Fury* (1961); *Terrible Swift Sword* (1963); and *Never Call Retreat* (1965).

Cattopadhyay, Bankim Candra (Indian author): see Chatterjee, Bankim Chandra.

Catullus, Gaius Valerius (b. c. 84 bc, Verona, Cisalpine Gaul—d. c. 54 bc, Rome), Roman poet whose expressions of love and hatred are generally considered the finest lyric poetry of ancient Rome. In 25 of his poems he speaks of his love for a woman he calls Lesbia, whose identity is uncertain. Other poems by Catullus are scurrilous outbursts of contempt or hatred for Julius Caesar and lesser personages.

Life. No ancient biography of Catullus survives. A few facts can be pieced together from external sources, in the works of his contemporaries or of later writers, supplemented by inferences drawn from his poems, some of which are certain, some only possible. The unembroidered, certain facts are scanty. Catullus was alive 55–54 bc on the evidence of four of his poems and died young according to the poet Ovid—at the age of 30 as stated by St. Jerome (writing about the end of the 4th century), who nevertheless dated his life erroneously 87–57 bc. Catullus was thus a contemporary of the statesmen Cicero, Pompey, and Caesar, who are variously addressed by him in his poems. He preceded the poets of the immediately succeeding age of the emperor Augustus, among whom Horace, Sextus Propertius, Tibullus, and Ovid name him as a poet whose work is familiar to them. On his own evidence and that of Jerome, he was born at Verona in northern Italy and was therefore a native of Cisalpine Gaul (Gaul This Side of the Alps); he owned property at Sirmio, the modern Sirmione, on Lake Garda, though he preferred to live in Rome and owned a villa near the Roman suburb of Tibur, in an unfashionable neighbourhood. According to an anecdote in the Roman biographer Suetonius' *Life of Julius Caesar*, Catullus' father was Caesar's friend and host, but the son nevertheless lampooned not only the future dictator but also his son-in-law Pompey and his agent and military engineer Mamurra with a scurrility that Caesar admitted was personally damaging and would leave its mark on history; the receipt of an apology was followed by an invitation to dinner "the same day," and Caesar's relations with the father continued uninterrupted. (Suetonius cites the episode as an example of Caesar's clemency.)

Catullus' poetry reports one event, externally datable to c. 57–56 bc, a journey to Bithynia in Asia Minor in the retinue of Gaius Memmius, the Roman governor of the province, from which he returned to Sirmio. It also records two emotional crises, the death of a brother whose grave he visited in the Troad, also in Asia Minor, and an intense and unhappy love affair, portrayed variously in 25 poems, with a woman who was married and whom he names Lesbia, a pseudonym (Ovid states) for Clodia, according to the 2nd-century writer Apuleius. His poems also record, directly or indirectly, a homosexual affair with a youth named Juventius.

Such are the stated facts. The conjectural possibilities to be gleaned mostly from the internal evidence of Catullus' poetry extend a little further. It is accepted that Catullus was born c. 84 bc and that he died c. 54 bc. His father's hospitality to Caesar may have been exercised in Cisalpine Gaul when Caesar was governor of the province, but equally well at Rome—Suetonius does not indicate time or place. Catullus' Roman villa may have been heavily mortgaged (depending on the choice

of manuscript reading of one poem). A yacht retired from active service and celebrated in an iambic poem may have been his own, built in Bithynia, in northwestern Asia Minor, and therefore available to convey him on his way home to Sirmio after his tour of duty. His fellow poet Cinna may have accompanied him to Bithynia. For the governor Memmius, himself a litterateur (to whom the Roman philosophic poet Lucretius dedicated his poem on the nature of things, *De rerum natura*), such company might be congenial, and it is possible to speculate that Cinna was on board the yacht. The brother's grave could have been visited en route to or from Bithynia.

The poet's Clodia may have been a patrician, one of the three Clodia sisters of Cicero's foe Publius Clodius Pulcher, all three the subject of scandalous rumour, according to Plutarch. If so, she was most probably the one who married the aristocrat Metellus Celer (consul 60 bc, died 59 bc), who in 62 bc was governor of Cisalpine Gaul. It may have been at that time that the youthful poet first met her and possibly fell under her spell. She is accorded a vivid if unflattering portrait in Cicero's *Pro Caelio*, in which the orator had occasion to blacken her character in order to defend his client against Clodia's charge that as her lover after her husband's death he had tried to poison her. The client was Marcus Caelius Rufus, conceivably the Rufus reproached by Catullus in poem LXXVII as a trusted friend who had destroyed his happiness (but if so, the Caelius of poem C is a different person). This identification of Clodia, suggested by an Italian scholar of the 16th century, has found support in some uncertain inferences from the Lesbia poems: the poet's mistress besides being married perhaps moved in society, enjoyed fashionable amusements, was cultivated and witty, and was licentious enough to justify Cicero's attack. On the other hand, the poet twice appears to have included the protection of his own rank among the gifts he had laid at her feet.

The poetry. A consideration of the text of Catullus' poems and of its arrangement is of unusual interest. Its survival has been as precarious as his biography is brief. Not being part of the school syllabus, from roughly the end of the 2nd century to the end of the 12th century, it passed out of circulation. Knowledge of it depends on a single manuscript discovered c. 1300, copied twice, and then lost. Of the two copies, one in turn was copied twice, and then it was lost. From the three survivors—in the Bodleian Library at Oxford, the Bibliothèque Nationale in Paris, and the Vatican Library in Rome—scholars have been able to reconstruct the lost "archetype." Incorrect transcription in the preceding centuries (some 14 instances are beyond repair), however, has invited frequent and often uncertain emendation. Depending on whether one poem is divided or not, 113 or 114 poems survive. In the printed total of 116, numbers XVIII to XX were inserted by early editors without proof that they were written by Catullus. In 14 instances gaps are visible (eight of these of one or more lines), and in possibly six poems fragments of lost poems have been left attached to existing ones. Ancient citations indicate the existence of at least five more poems. The surviving body of work is therefore mutilated and incomplete and (in contrast to the *Odes* of Horace) cannot in its present published form represent the intentions of either author or executors, despite the elegant dedication to the historian Cornelius Nepos that heads it. With these qualifications, it permits the reconstruction of a poetic personality and art unique in Latin letters.

The collection is headed by 57 "short poems," ranging in length between 5 and 25 lines (number X, an exception, has 34) in assorted metres, of which, however, 51 are either hendecasyllabic—that is, having a verse line of 11 syllables (40 such)—or iambic—basically of

alternate short and long syllables (11). These rhythms, though tightly structured, can be characterized as occasional or conversational. There follow eight "longer poems," ranging from 48 lines to 408 (number LXV, of 24 lines, is prefatory to number LXVI) in four different metres. The collection is completed by 48 "epigrams" written in the elegiac distich, or pair of verse lines, and extending between 2 and 12 lines, a limit exceeded only by two poems, one of 26 lines and the other of 16.

This mechanical arrangement, by indirectly recognizing the poet's metrical virtuosity and proposing three kinds of composition, justly calls attention to a versatility disproportionate to the slim size of the extant work. The occasional-verse metres and the elegiac distich had been introduced into Latin before his day. Traditionally both forms, as practiced by Greek writers after the 4th century bc and their Roman imitators, had served for inscriptions and dedications and as verse of light occasions, satirical comment, and elegant sentiment. Catullus and his contemporaries continued this tradition; but in some 37 instances the poet uniquely converts these verse forms to serve as vehicles of feelings and observations expressed with such beauty and wit, on the one hand, or such passion, on the other, as to rank him, in modern terms, among the masters of the European lyric—the peer of Sappho and Shelley, of Burns and Heine—but exhibiting a degree of complexity and contradiction that the centuries-later Romantic temperament would scarcely have understood. The conversational rhythms in particular, as he managed them for lyric purposes, achieved an immediacy that no other classic poet can rival.

In his longer poems Catullus produced studies that deeply influenced the writers and poets of the Augustan Age: two charming marriage hymns; one frenzied cult hymn of emasculation; one romantic narrative in hexameters (lines of six feet) on the marriage of Pelcus with the sea goddess Thetis; and four elegiac pieces, consisting of an epistle introducing a translation of an elegant conceit by the Alexandrian poet Callimachus, followed by a pasquinade, or scurrilous conversation, between the poet and a door (of poor quality, perhaps a youthful effort), and lastly a soliloquy (unless indeed this be two poems) addressed to a friend and cast in the form of an encomium, or poem of praise. The Augustan poet Virgil is content to imitate Catullus without naming him, even going so far, in the *Aeneid*, as thrice to borrow whole lines from him. Horace both imitated Catullus and criticized him. Tibullus, Propertius, Ovid, and later Martial both imitate and affectionately commemorate him.

Assessment. In his lifetime, Catullus was a poet's poet, addressing himself to fellow craftsmen (*docti*, or scholarly poets), especially to his friend Licinius Calvus, who is often posthumously commemorated along with him. It is now fashionable to identify this coterie as the *poetae novi*, or "Neoterics" (the modern term for these new poets), who preferred the learned allusiveness and mannered and meticulous art of the Alexandrian poets to the grander but archaic fashion of Ennius, the father of Roman poetry. The school was criticized by Cicero and by Horace, who names Calvus and Catullus. To the degree that Catullus shared such conceptions of what might be called poetic scholarship, he is to be numbered in the company of Gerard Manley Hopkins, T.S. Eliot, and Ezra Pound rather than with the Romantics.

For the general reader, the 25 Lesbia poems are likely to remain the most memorable, recording as they do a love that could register ecstasy and despair and all the divided emotions that intervene. Two of them with

unusual metre recall Sappho, the poetess of the Aegean island of Lesbos, as also does his use of the pseudonym Lesbia. As read today, these two seem to evoke the first moment of adoring love (number LI, a poem that actually paraphrases its Sapphic model) and the last bitterness of disillusionment (number XI). On the other hand, the poems of invective, which spare neither Julius Caesar nor otherwise unknown personalities, male and female, may not have received the critical attention some of them deserve. Their quality is uneven, ranging from the high-spirited to the tedious, from the lapidary to the laboured, but their satiric humour is often effective, and their obscenity reflects a serious literary convention that the poet himself defends. Between these two poles of private feeling lie a handful of transcendent and unforgettable compositions: the lament at his brother's grave; the salute to Sirmio his beloved retreat; the exchange of vows between Acme and Septimius; his elegy for the wife of Calvus; and even that vivid mime of a moment's conversation in a leisured day, in which the gay insouciance of a few young persons of fashion, the poet included, going about their affairs in the last days of the Roman Republic, is caught and preserved for posterity. (E.A.Ha.)

MAJOR WORKS. Catullus' 116 extant poems may be classified under the headings lyric, epithalamium, miniature epic, elegy, and epigram. They were mostly written between 61 and 54 BC but cannot be dated exactly.

Apart from V, VII, VIII, XI, LVIII, and LXXXVI, which, with many others, are all devoted to the theme of Lesbia, Catullus' mistress, whether in delight, sorrow, or anger, special mention may perhaps be made of XXX, to a false friend; of XXXI, on his home at Sirmio; and of CI, on his brother's death.

BIBLIOGRAPHY. The text of R.A.B. Mynors (1958), whose *Praefatio* succinctly explains the procedures essential for reconstruction of the text and summarizes the history of the first printed Renaissance editions, is standard. This text may be supplemented by the German edition of Mauritiuss Schuster (1949; rev. with additional bibliography by W. Eisenhut, 1958); and by the French Budé text of Georges Lafaye (1922; 3rd ed. rev. by M. Duchemin, 1949).

Commentaries. The second edition of Robinson Ellis (1889) remains a classic despite its age. The American text and commentary of E.T. Merrill (1893, reprinted 1951) was long the only unabridged edition available in English; it is now joined by Kenneth Quinn, *Catullus: The Poems, Edited with Commentary* (1970). The otherwise exhaustive edition of C.J. Fordyce (1961) omits certain poems of significant critical interest, either literary or biographical. The German commentary of Wilhelm Kroll (1923, reprinted 1968) is a standard and complete work. That in Italian by M.L. De Gubernatis, 2nd ed. (1933, reprinted 1953), stresses literary interpretation.

General. Estimates of Catullus' poetry and its place in Latin letters are offered by A.L. Wheeler, *Catullus and the Traditions of Ancient Poetry* (1934, reprinted 1964), who gives special attention to the longer poems; by E.A. Havelock, *The Lyric Genius of Catullus* (1939, reprinted 1967), who sees the secret of the poet's significance in the short poems; and by Kenneth Quinn, *The Catullan Revolution*, 2nd rev. ed. (1969), who stresses the poet's place within the Roman tradition; as does David O. Ross, Jr., *Style and Tradition in Catullus* (1969). The biographical approach to the poems, pervasive in Merrill's commentary and criticized by Havelock, has been revived by T.P. Wiseman, *Catullan Questions* (1969).

Translations. These, unabridged, responding to a new tolerance of the obscene in literature, have recently proliferated. Aside from the Loeb Library edition (text and translation by F.W. Cornish, 1912), versions in a more contemporary style include the following: F.O. Copley, *Complete Poetry of Catullus* (1957); R.A. Swanson, *Odi et Amo: Complete Poetry* (1959); Peter Whigham, *Poems of Catullus* (1966); Reney Myers and Robert J.

Ormsby, *Catullus: The Complete Poems for American Readers* (1970); and Frederic Raphael and Kenneth McLeish, *The Poems of Catullus* (1979).

Catulus, Gaius Lutatius (fl. 3rd century BC), Roman commander, victor in the final battle of the First Punic War between Rome and Carthage (264–241). As consul in 242, he blockaded the Sicilian cities of Lilybaeum and Drepanum with a fleet of 200 ships. On March 10, 241, the Carthaginian relieving fleet was totally defeated near the Aegates Islands off western Sicily. Catulus, who had made the decision to attack, shared in the triumph, though a wound had prevented him from taking part in the operations.

Catulus, Quintus Lutatius (d. 86 BC), Roman general, at first a colleague and later a bitter enemy of the politically powerful commander Gaius Marius.

As consul with Marius in 102, Catulus was sent to hold the passage of the Alps from the invading Cimbri and Teutoni tribes, but he was forced back to the Po River. In 101 the Cimbri were defeated in the Raudian Fields, near modern Vercelli, Italy, by the united armies of Catulus and Marius. When the chief credit for this victory went to Marius, Catulus sided with Marius' political rival, Lucius Cornelius Sulla. After Marius' capture of Rome late in 87, Catulus was forced to commit suicide. Catulus was distinguished as an orator, poet, and prose writer.

Catulus, Quintus Lutatius (b. c. 120 BC—d. 61/60), Roman politician, a leader of the Optimates, the conservative faction in the Senate.

Catulus' father, Quintus Lutatius Catulus, had been forced to commit suicide after Gaius Marius' capture of Rome. The younger Catulus therefore became an adherent of Marius' opponent, the commander Lucius Cornelius Sulla, who was dictator of Rome from 82 to 80. In 78, when he was consul, Catulus defeated an army led by his colleague in the consulship, Aemilius Lepidus, who sought to overthrow Sulla's constitutional innovations. Catulus unsuccessfully opposed laws conferring extraordinary military powers upon the ambitious Pompey in 67 and 66; as censor in 65, Catulus fought the attempt of Marcus Licinius Crassus to enfranchise the Transpadane Gauls. A consistent opponent of Julius Caesar, Catulus suffered a bitter disappointment when Caesar was elected *pontifex maximus* ("high priest") in 63 over his own far stronger claim. The Optimate leader unsuccessfully attempted to implicate Caesar in Catiline's conspiracy to seize power (63), and in return Caesar in 62 accused Catulus of embezzling public funds—a charge that was later dropped.

Catuvellauni, probably the most powerful Belgic tribe in ancient Britain; it occupied the area directly north of the River Thames. The first capital of the Catuvellauni was located near Wheathampstead, but after their defeat by Julius Caesar in 54 BC, they expanded to the north and northwest, building a new capital at Verulamium, near St. Albans. The Catuvellauni practiced agriculture extensively and apparently had a prosperous economy.

Cauca, department, southwestern Colombia, stretching eastward from the Pacific Ocean across the Andean Cordilleras (mountains) Occidental and Central, which are separated by the fertile valley of the upper Río Cauca. The department, 11,316 sq m² (29,308 sq km), is rich in minerals and forests, but it has made little progress in agriculture because of inadequate transportation. Cattle raising and the cultivation of coffee, bananas, corn (maize), rice, and sugarcane are the main economic activities. A railroad connects Popayán (*q.v.*), the departmental capital, with Cali, in Valle

Main street of Popayán, capital of Cauca, Colombia

join the Río Magdalena north of Mompós. In its middle reaches, the Cauca flows through the broad, fertile intermontane depression of the Valle del Cauca (where sugarcane, cacao, bananas, corn [maizè], and rice are grown, and cattle are raised) at an elevation of 3,100–3,300 ft (940–1,000 m). Together with the adjacent uplands, the valley has been organized under a regional authority to promote balanced agricultural, commercial, and industrial development. Food, paper, and textile industries are important. The volcanic uplands produce two-thirds of Colombia's coffee. The river is navigable by river steamers below Cáceres, Antioquia department.

Caucasian PEOPLES, various ethnic groups living in the Caucasus, a geographically complex area of mountain ranges, plateaus, foothills, plains, rivers, and lakes, with grasslands, forests, marshes, and dry steppes. The complex of regions harbours more than 50 separate peoples, ranging from language communities with only a few hundred speakers to large national groups numbering millions. This diversity is not of recent date. Pliny the Elder related that the Romans carried on their business there through 80 interpreters. Arab geographers called the Caucasus Jabal al-Alsine, Mountain of Languages.

The languages of the Caucasus belong to four different families: Caucasian (or Paleocaucasian), Indo-European, Turkic, and Semitic. Whereas speakers of the latter three groups are known to have migrated to the Caucasus in

historical times, speakers of the Caucasian languages occupied the area at the dawn of history.

The Caucasian peoples are subdivided, like the Caucasian languages, into two northern branches and a southern branch. The southerners, comprising the Georgians, the closely related Mingrelians and Laz, and the Svan, make up the Republic of Georgia and live in western Transcaucasia (the Laz live in Turkish territory). Among the many peoples that make up the two smaller northern groups, the Chechens, who constitute the majority of the population of Chechnia republic in southwestern Russia, and the Kabardians, settled along the Kuban and upper Terek river basins, are the most populous. Among other northern Caucasian peoples are the Abkhaz, the Ingush, and the Lezgi. There are a vast number of less populous groups.

Of the Indo-European peoples, the ancestors of the Armenians entered Transcaucasia from Anatolia in the early 1st millennium BC. A second ancient Indo-European group is the Ossetes, or Ossetians, in the central Greater Caucasus; they are a remnant of the eastern Iranian nomads who roamed the south Western Steppe from the 7th century BC until the 4th century AD (when they were expelled by the Huns) and who were successively known as Scythians, Sarmatians, and Alans. Slavic groups account for more than one-third of the total population of the Caucasus; they live in the north and consist mainly of Russians and Ukrainians. Finally, there are such Indo-European groups as Kurds, Talysh, Tats, Greeks, and Gypsies distributed in various areas of the Caucasus.

Among the Turkic peoples are the Azerbaijani (Azerbaijanians) in the southwest and the Kipchak Turks in the north. Of mixed ethnic origin, the Azerbaijani are at least in part composed of the indigenous population of eastern Transcaucasia and possibly an admixture of the Medians of northern Persia. They were in turn Persianized during the rule of the Sasanians (3rd-7th century AD), and, after conquest by Seljuq Turks in the 11th century, Turkicized. The Turkic influence remained strong throughout the following centuries. The Kipchak Turks are a group of small, but distinct peoples including the Kumyk, Nogay, Karachay, and Balkar. The indigenous Kumyk, like the other Kipchak Turks, are largely Muslim. Their language was for some three centuries the lingua franca of the region, but in the 20th century it was supplanted by Russian. The Nogay are thought to have become a distinct group formed after the disintegration of the Golden Horde. Most were nomads until the early 20th century. Both the Karachay and the Balkar are of unknown origins.

The only Semitic peoples in the Caucasus are the Assyrians, who fled to Russian territory from Turkish persecution at the end of World War I and live mainly in the cities.

The traditional economy of the peoples of the Caucasus is based on agriculture, cattle and sheep herding, and cottage industries. The main crops are millet, barley, wheat, and corn (maize). Wine production is highly developed in Transcaucasia, especially in Georgia. Crafts, such as rug weaving, are developed in Dagestan republic, Russia; Armenia; and Azerbaijan.

In the treeless highlands, villages consist of stone houses clustered together and built into the mountain slope. In the western Caucasus, villages consist of individual homesteads surrounded by fences, the buildings being made of wood or of wattle coated with clay. In central and eastern Transcaucasia, houses have a cupola-shaped vault on pillars, with an opening at the top that serves as a window and smoke vent.

Everywhere in the Caucasus are traces of a

patriarchal clan system and a tribal organization of society. These features have been best preserved among the mountaineers. In general, however, the tribal system gradually gave way to a system of village communities. Feudal relations developed especially in Georgia, Armenia, and Azerbaijan and in some parts of the northern Caucasus. During the Soviet period all areas were subjected to heavy Russian influence.

Traditionally, the major religions in the Caucasus have been Islām (notably the Turkic groups), the Eastern Orthodox church (chiefly Georgians), the Armenian Gregorian church, and Judaism. There are also numerous minority sects.

Caucasian languages, those languages indigenous to the Caucasus region that have not been affiliated with any of the larger language families (such as Indo-European).

Distribution of the Caucasian languages

A brief treatment of Caucasian languages follows. For full treatment, see *MACROPAEDIA: Languages of the World: Caucasian languages*.

The genetic relationship of the Caucasian languages to any languages outside the Caucasus is highly speculative and as yet unproven. Several linguists have proposed an "Ibero-Caucasian" family comprising all of the Caucasian languages and Basque. Others have sought to link these languages with the as yet unaffiliated languages of the ancient Middle East (e.g., Sumerian and Hurrian-Urartian). Within the Caucasian languages, most scholars accept the following grouping: South Caucasian (Kartvelian), Northwest Caucasian (Abkhazo-Adyghian), and Northeast Caucasian (Nakho-Dagestanian).

The Kartvelian (South Caucasian) language family includes Georgian, Mingrelian, Laz, and Svan. Georgian, the national language of Georgia, is the only Caucasian language with an ancient literary tradition. (See Georgian literature.) Monuments were inscribed in an Old Georgian script derived from the Greek alphabet; the modern Georgian writing system, a round-form cursive written from left to right, is an indirect descendant of the old script. Mingrelian, Laz, and Svan are unwritten languages, with Mingrelian and Laz sometimes

seen as dialects of a single language. Mingrelian and Laz are spoken along the Black Sea coast; Svan is spoken in the high mountain valleys south of Mount Elbrus. The Kartvelian languages are considered to be closely related and descended from a common language. The sound system in these languages is relatively uniform, and they have a highly developed system of word inflection, that is, of word endings and derivation.

The Abkhazo-Adyghian (Northwest Caucasian) group consists of the Abkhaz, Abaza, Adyghian, Kabardian, and Ubykh languages. Abkhaz is spoken in Abkhazia, Georgia, and the other languages of this group are spoken in the northwestern Caucasus region of Russia. The Ubykh language, however, is virtually

extinct. The Abkhazo-Adyghian languages are not widely differentiated into dialects. Phonologically, they have a limited number of distinctive vowels but up to 80 distinctive consonant sounds.

The Nakho-Dagestanian (Northeast Caucasian) group consists of the Nakh and Dagestanian languages. Two Nakh languages—Chechen and Ingush—are spoken mainly in Chechnia and Ingushetia republics of Russia. A third, Bats, is spoken in Georgia. The Dagestanian languages can be divided into the following groups: (1) the Avar-Andi-Dido languages of central and western Dagestan, Russia, and part of Azerbaijan, (2) the Lak-Dargin (Lak-Dargwa) languages of central Dagestan, and (3) the Lezgian languages, principally of southern Dagestan.

Compared with the other two Caucasian families, the Nakho-Dagestanian is less clearly unified from a genetic standpoint. While some linguists join Nakho-Dagestanian with Abkhazo-Adyghian into a single North Caucasian family, others separate the Nakh languages (Central Caucasian) and the Dagestanian languages (East Caucasian) into two distinct families.

The original vocabulary of the North Caucasian languages has been fairly well preserved

in the modern languages, though there are many loanwords. The written languages of the area are the state languages. Newspapers, radio, and television use the local languages; and children in primary schools are taught in their mother tongue. The North Caucasian alphabets are based on the Cyrillic alphabet, which was adopted in 1936–38.

Caucasus, Russian *КАВКАЗ*, region and mountain system lying between the Black and Azov seas (west) and the Caspian Sea (east) and occupied by Russia, Georgia, Azerbaijan, and Armenia. The Caucasus is part of the traditional dividing line between Europe and Asia, but there now is general agreement for assigning the mountains wholly to Asia.

A brief treatment of the Caucasus follows. For full treatment, see *MACROPAEDIA: Asia*.

The Great Caucasus Range extends for approximately 750 miles (1,200 km) southeastward along the breadth of the Caucasus region. The country north of the Great Caucasus is called Ciscaucasia; the region south of the range is called Transcaucasia.

The Great Caucasus is a series of ranges running generally northwest-southeast, including the principal peaks of Mount Elbrus (18,510 feet [5,642 m]), Mount Dykhtau (17,073 feet [5,204 m]), and Mount Shkhara (16,627 feet [5,068 m]). The Great Caucasus has more than 2,000 glaciers, which cover about 1 percent of its total area. The Caucasus Mountains are crossed by several passes, notably the Mamison and the Daryal, and by the Georgian Military Road and the Ossetian Military Road, which connect Ciscaucasia with Transcaucasia to the south. Ciscaucasia north of the Great Caucasus consists of vast plains, much of them under cultivation for cereals. Transcaucasia is dominated by similar plains and by the Little Caucasus Range.

Water power resources are considerable. The deepest and most powerful rivers are the Rioni, the Kura, and the Araks. Lake Sevan is the largest lake of the Caucasus. The mountain slopes of the Caucasus are covered with forests, which include oak, chestnut, beech and alder, Caucasian fir, ash, and linden. Animal life includes chamois, red deer, bear, lynx, fox, and two species of mountain goat. The clear rivers and lakes are full of trout. The Caucasus is rich in deposits of various minerals, including coal, iron ore, lead, zinc, copper, molybdenum, and manganese. Petroleum is exploited in Azerbaijan and in Krasnodar and Stavropol *kraya* (regions), and natural gas deposits have acquired great importance.

INDEX
first

Cauchon, Pierre (b. 1371, near Reims, Fr.—d. Dec. 18, 1442, Rouen), French bishop of Beauvais, an ecclesiastic memorable chiefly because he presided over the trial of Joan of Arc.

Cauchon was educated at the University of Paris, of which he became rector in 1403. He became associated with the Burgundian party and took part in the riots of the Cabochiens (radical reformers) during 1413. He was subsequently banished from Paris in 1414, taking service with John the Fearless, Duke of Burgundy, thereafter. He became bishop of Beauvais in 1420. In 1422 Cauchon, as a counselor of Henry VI of England, became a servant of the king's regent in France, John Plantagenet, Duke of Bedford. Cauchon aided the Anglo-Burgundian alliance in gaining control of much of northern France from the French king. An excellent opportunity to serve the

Giraudon—Art Resource

English arose when Joan of Arc was captured in Cauchon's diocese in 1430. Cauchon was careful to disguise the political motivations of Joan's trial by conducting it according to inquisitorial procedure and by attempting to obtain from Joan a confession that would save her life. He is held formally responsible for her condemnation and subsequent execution as a heretic. Cauchon became bishop of Lisieux in 1432.

Cauchy, Augustin-Louis, Baron (b. Aug. 21, 1789, Paris, Fr.—d. May 23, 1857, Sceaux), French mathematician who pioneered in analysis and the theory of substitution groups (groups whose elements are ordered sequences of a set of things). He was one of the greatest of modern mathematicians.

At the onset of the Reign of Terror (1793–94) during the French Revolution, Cauchy's family fled from Paris to the village of Arcueil, where Cauchy first became acquainted with the mathematician Pierre-Simon Laplace and the chemist Claude-Louis Berthollet.

Cauchy became a military engineer and in 1810 went to Cherbourg to work on the harbours and fortifications for Napoleon's English invasion fleet. In spite of his work load he produced several mathematical papers of note, including the solution of a problem sent to him by Joseph-Louis Lagrange that established a relationship between the number of edges, the number of vertices, and the number of faces of a convex polyhedron, and the solution of Pierre de Fermat's problem on polygonal numbers.

Cauchy returned to Paris in 1813, and Lagrange and Laplace persuaded him to devote himself entirely to mathematics. The following year he published the memoir on definite integrals that became the basis of the theory of complex functions. From 1816 he held professorships in the Faculty of Sciences, the Collège de France, and the École Polytechnique, all in Paris. When Gaspard Monge was expelled for political reasons from the Academy of Sciences (1816), Cauchy was appointed to fill the vacancy. The same year he won the grand prix of the Institute of France for a paper on wave propagation, now accepted as a classic in hydrodynamics. In 1822 he laid the

foundations of the mathematical theory of elasticity.

Cauchy's greatest contributions to mathematics, characterized by the clear and rigorous methods that he introduced, are embodied predominantly in his three great treatises: *Cours d'analyse de l'École Royale Polytechnique* (1821; "Courses on Analysis from the École Royale Polytechnique"); *Résumé des leçons sur le calcul infinitésimal* (1823; "Résumé of Lessons on Infinitesimal Calculus"); and *Leçons sur les applications du calcul infinitésimal à la géométrie* (1826–28; "Lessons on the Applications of Infinitesimal Calculus to Geometry"). The first phase of modern rigour in mathematics originated in his lectures and researches in analysis during the 1820s. He clarified the principles of calculus and put them on a satisfactory basis by developing them with the aid of limits and continuity, concepts now considered vital to analysis. To the same period belongs his development of the theory of functions of a complex variable (a variable involving a multiple of the square root of minus one), today indispensable in applied mathematics from physics to aeronautics.

Although acting only from the highest motives, Cauchy often offended his colleagues by his self-righteous obstinacy and aggressive religious bigotry. Upon the exile of Charles X in 1830 and the ascension of Louis-Philippe to the throne, Cauchy went into exile, too, rather than take the oath of allegiance. A chair of mathematical physics was created for him at the University of Turin, but in 1833 he left to tutor the Duke of Bordeaux, grandson of Charles X. In 1838, with the suspension of the oath, he returned to France, resuming his chair at the École Polytechnique.

Cauchy made substantial contributions to the theory of numbers and wrote three important papers on error theory. His work in optics provided a mathematical basis for the workable but somewhat unsatisfactory theory of the properties of the ether, a hypothetical, omnipresent medium once thought to be the conductor of light. His collected works, *Oeuvres complètes d'Augustin Cauchy* (1882–1970), were published in 27 volumes.

caucus, any political group or meeting organized to further a special interest or cause.

The word caucus originated in Boston in the early part of the 18th century, when it was used as the name of a political club, the Caucus, or Caucus Club. In that club public matters were discussed and arrangements made for local elections and the choosing of candidates for offices. In its subsequent and current usage in the United States, the term caucus came to be used in a more restricted sense to denote a meeting either of party managers or of duty voters, as for instance a "nominating caucus," for nominating candidates for office or for selecting delegates for a nominating convention. The caucus of a party's members in Congress nominated its candidates for the office of president and vice president from 1796 until 1824. At the same time, the candidates for governor and lieutenant governor were nominated by the party members of the state legislatures in what was known as the legislative nominating caucus. Occasionally, districts unrepresented in the legislature sent in delegates to sit in with the members of the legislature when these nominations were made, and this was termed the mixed legislative nominating caucus.

The American use of the term caucus has also been extended to denote a faction within a legislative body that attempts to further its interests by trying to influence matters of party policy on proposed legislation or legislative offices. Hence such bodies as the Black Caucus (representing African Americans) and the Women's Caucus.

In Great Britain, the term caucus first came

into use in 1878, when Joseph Chamberlain and Frank Schnadorst organized the Liberal Association of Birmingham on strict disciplinary lines, particularly with a view toward managing elections and controlling voters. This type of organization became the model for other Liberal associations throughout the country; and, because it was a supposed imitation of the U.S. political "machine," Benjamin Disraeli gave it the name caucus. Thus, the name came to be used thereafter, not in the U.S. sense of a meeting but of a closely disciplined system of party organization, not infrequently as a term of abuse applied by politicians of one party to the controlling organization of its opponents.

Caudine Forks, Latin *FURCULAE CAUDINAE*, narrow mountain pass near Beneventum in ancient Samnium (near modern Montesarchio, Campania, southern Italy). In the Battle of Caudine Forks the Samnites under Gavius Pontius defeated and captured a Roman army in 321 BC, during the Second Samnite War. The Roman army surrendered, and acknowledged that they had been defeated by passing under a "yoke" of Samnite spears, a unique disgrace.

caudle cup, small, two-handled silver cup, usually with a cover, originally made in England during the second half of the 17th century and possibly used for caudle—warm ale or wine mixed with bread or gruel, eggs,

Silver-gilt caudle cup, English, 1660; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum London

sugar, and spices—which was administered to women after childbirth and to convalescents. The cup is gourd shaped, without a foot, and of thinnish metal usually embossed (ornamented with relief work) with floral motifs. Caudle cup handles, which flare out on either side, are cast in various grotesque shapes. Sometimes the domed cover has a flat, spool-shaped finial that enables it to be reversed and used as a stand.

Caughley ware, porcelain produced by the Caughley China Works, a factory in Caughley, Shropshire, Eng. A local earthenware pottery was extended in 1772 by Thomas Turner to make soaprock porcelain; a close connection existed with Worcester, and from there Robert Hancock, the pioneer engraver of copper plates for transfer printing, joined Turner in 1775. The bulk of Caughley's so-called "Salopian" ware was blue-and-white, mostly blue-printed or powder-blue; in shade, an initial soft blue was succeeded c. 1780 by a stronger violet blue. Blue painting was without distinction, nor was it made in any quantity, and only one form—a mask jug copied from Worcester, molded in the cabbage-leaf style, and painted in enamels and gilt—is noteworthy. Turner's exploitation of blue-printing techniques brought him success; he issued a wide range of patterns, including sporting subjects, views, and commemorative pieces (such as that showing the world's first all-iron bridge built nearby in 1779) that were embellished with elaborate scrolled or brocaded borders. Caughley polychrome decoration is inferior in quality, but some flower painting is colourful.

Caughley porcelain mask jug molded in cabbage-leaf style and painted in underglaze colours and gilt, Shropshire, England, c. 1790; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London, photograph, EB Inc

White porcelain was supplied to independent decorators. One distinction of the factory was its introduction of the perennial Willow pattern; the original, dated 1779, was intended for a teapot, and the best known version was developed by Turner in the late 1780s. Blue Willow ware remained, from many subsequent factories, perhaps the most widespread of domestic designs. The Caughley works was bought by John Rose in 1799.

Caulaincourt, Armand(-Augustin-Louis), marquis de, DUC (duke) DE VICENCE (b. Dec. 9, 1773, Caulaincourt, Fr.—d. Feb. 19, 1827, Paris), French general, diplomat, and ultimately foreign minister under Napoleon. As the Emperor's loyal master of horse from 1804, Caulaincourt was at Napoleon's side in his great battles, and his *Mémoires* provide an important source for the period 1812 to 1814.

In 1795 he became a cavalry conscript in western France and in 1799 was named a colonel of a crack cavalry regiment, which he led at the Battle of Hohenlinden (1800). Talleyrand, his father's friend, employed him in Russia (1801–02), where he impressed Alexander I. Napoleon took him as aide-de-camp on his return. In March 1804 he was sent to Baden to deal with royalist agents from beyond the Rhine; this led to the arrest and eventual execution of the Duc d'Enghien, an action that Caulaincourt did not wholly condone, though the orders were relayed through him.

From November 1807 to February 1811, Caulaincourt was ambassador to Russia, working incessantly for peace against Napoleon's arbitrary policy. Napoleon created him duc de Vicence (Vicenza) in 1808. Recalled in 1811,

Caulaincourt, lithograph by F.-S. Delpech after a portrait by J.-B. Belliard

By courtesy of the Bibliotheque Nationale, Paris

Caulaincourt was subjected to Napoleon's angry taunts that he was "Russian." After the invasion of Russia began (1812), Caulaincourt asked to be sent to Spain, as far away from the Emperor as possible. Yet he was part of the small entourage accompanying Napoleon on his return from Russia to Paris.

Caulaincourt negotiated the armistice in Silesia (June 1813) and went to the abortive congress at Prague. After the Battle of Leipzig, he became foreign minister as the "man of peace," but Napoleon was not peaceful, and by mid-March 1814 the congress of Châtillon had failed. Caulaincourt finally reached Alexander I and, on April 10, 1814, signed the treaty that sent Napoleon to Elba; he was with him in the last grim week at Fontainebleau. In 1815 he resumed the hopeless task of being Napoleon's foreign minister. After Waterloo Alexander's intervention saved him from the Bourbon proscription. Henceforth he lived in retirement, still trying to clear his name of complicity in the Engien case.

Cauliaco, Guido de (medieval surgeon): see Chauliac, Guy de.

cauliflower (*Brassica oleracea*, Botrytis group), form of cabbage (*q.v.*), of the mustard family (Brassicaceae), consisting of a compact terminal mass of greatly thickened, modified, and partially developed flower structures, together with their subtending fleshy stalks.

Cauliflower (*Brassica oleracea*, Botrytis group)

Derek Fell

As desired for food, this terminal cluster forms a firm, white, succulent "curd." The broad, much-elongated leaves extend far above this curd. In most varieties the leaves must be tied together well above the curd, or broken over it, several days before harvest to prevent discoloration of the curd by sunlight.

Cauliflower is frequently served as a cooked vegetable, and the separated flower structures are also used in salads and as relishes in raw form.

cauliflower ear, distortion of the cartilage of the outer ear as the result of an injury. If the injury causes bleeding between the cartilage and the skin, it produces a smooth and rounded purplish swelling. Accumulated clotted blood, if not removed, is transformed into scar tissue, causing permanent, odd-shaped thickening of the outer ear. Because boxers' and wrestlers' ears are subjected to so much pounding abuse, cauliflower ear is often associated with those sports.

cauliflower ware, in pottery, creamware modelled and glazed in green and yellow to simulate a cauliflower, the term also applying to other fruit or vegetable forms. About 1760, William Greatbach undertook the potting and modelling, jobbed out to him by Josiah Wedg-

wood, of cauliflower tureens and stands, lettuce pots, and pineapple teapots, which were returned to Wedgwood for glazing. Production was lively and was imitated by other Stafford-

Cauliflower ware teapot, probably Wedgwood, Burslem, Staffordshire, Eng., c. 1763; in the Victoria and Albert Museum, London

shire potters, yet it died out after 1769, when Wedgwood's new Etruria works was opened; the cabbage or cauliflower spout, however, was a molded detail still used by Wedgwood. The Rococo vogue for plant forms may be seen in the many Chelsea dishes and small tureens of the 1750s in the form of cauliflowers and cabbages, as well as melon, quince, cucumber, and lemon tureens, very rare in "Wedgwood-Greatbach" ware. Meissen was the origin of most of these designs, and tureens in faience were the specialty of some continental factories, notably Brussels and Holitsch. Particularly successful in this genre is a cauliflower teapot, small in scale and partially covered in Wedgwood's green glaze.

Caulery, Maurice (-Jules-Gaston-Corneille) (b. Sept. 5, 1868, Bergues, Fr.—d. July 15, 1958, Paris), French biologist famous for his research on parasitic protozoans and marine invertebrates.

Caulery
H Roger Viollet

Caulery taught at the University of Marseille (1900) and the University of Paris (1903) and succeeded Alfred Giard as director of the zoological station at Wimereux (1909). He was particularly interested in how the morphology, reproduction, and ecology of tunicates (related to vertebrates) and annelid worms had a bearing on their evolution. He also described and named the marine worm *Siboglinum weberi*, which later became the basis for establishing the invertebrate phylum Pogonophora.

Among Caulery's more important works are *Le Parasitisme et la symbiose* (1922; *Parasitism and Symbiosis*, 1952), *Le problème de l'évolution* (1931; "The Problem of Evolution"), and *Organisme et sexualité* (1942; "Organism and Sexuality").

Caulonia, ancient Greek city in southern Italy, southernmost of the colonies founded in Italy by the Achaeans. Established perhaps in the first half of the 7th century BC, Caulonia was an outpost of Croton. Judging from its copious and beautiful coinage from the second half of the 6th century, it seems to have been of some importance despite its small size. After capture by Campanian troops during the invasion (280–275) by Pyrrhus, king of Epirus, and then submission to Hannibal in 215, the city withstood a siege (209) on Hannibal's side in the Second Punic War, but its fortunes declined soon after.

Excavations at the site, located on the eastern coast of modern Calabria, nine miles from modern Caulonia, have revealed remains of fortifications with towers of the Hellenistic period, a large Doric temple, a small tem-

Silver stater from Caulonia, 540–510 BC; in the Bibliothèque Nationale, Paris

Graudon—Art Resource/EB Inc.

ple, and terra-cotta fragments of architectural structures.

Caunt, Benjamin (b. March 22, 1815, Hucknall-Torkard, Nottinghamshire, Eng.—d. Sept. 10, 1861, London), British prizefighter, one of the first to aspire to a world's championship in addition to national honours.

Caunt claimed the English title after winning from Bendigo (William Thompson) on a questionable foul in 75 rounds on April 3, 1838. When on Oct. 26, 1840, he beat John Leechman after 101 rounds, he was considered champion of England. In 1841 he went to the United States seeking opponents for the world's championship, but no match was ever made. Charles Freeman of Michigan, who stood 6 feet 10½ inches and weighed about 250 pounds, challenged Caunt, who, instead of fighting Freeman, became his manager and took him to England for a series of exhibition bouts there. Caunt was defeated by Bendigo on a foul in 93 rounds on Sept. 9, 1845, yielding his disputed claim to the title.

Caupolicán, also spelled QUEPOLICÁN (b. early 16th century, Palmaiquén, Chile—d. 1558, Cañete), Mapuche chief and a leader of the Indian resistance to the Spanish invaders of Chile.

With the assistance of Lautaro, another Mapuche, Caupolicán and his men captured the Spaniards' leader, Pedro de Valdivia, after a battle at Tucapel in December 1553. Reportedly, Caupolicán attempted but failed to save Valdivia from torture and execution (January 1554). In April 1557 Lautaro was defeated and executed by an army led by Francisco de Villagrán at Mataquito, leaving Caupolicán in sole command of the Indian resistance. After an initial victory against Villagrán, Caupolicán suffered three disastrous routs at the hands of forces led by Don García Hurtado de Mendoza, losing more than 6,000 men

in one of the defeats. Caupolicán retreated to the mountains near Cañete, where he was finally captured by Capt. Alonso de Reinoso and barbarously murdered in 1558. Although Caupolicán was a man of great skill and valour, his fame rests primarily on the verses dedicated to him by the poet Alonso de Ercilla y Zúñiga in his long poem *La Araucana*. The poet was with the army of Mendoza and apparently witnessed firsthand the deeds of the Mapuche chief.

Causses, gorge-gouged limestone plateaus of southwestern France. The name is from *cau*, local form of *chaux*, meaning "lime." At elevations of from 3,000 to 4,000 ft (900 to 1,200 m), the Grands-Causses form part of the Massif Central and occupy parts of Aveyron and Lozère départements. Lower limestone plateaus farther west in Quercy and Périgord are called the Petits Causses.

About 60 mi (100 km) from north to south and about 30 mi wide, the plateaus are bare, karstlike, stony solitudes amid whose boulders scanty brush appears. The Tarn and Aveyron rivers have carved canyons with fantastic rock shapes, and it is in their sheltered valleys that settlement still clings.

The dramatic gorges and the eerie white plateaus attract an increasing number of tourists, mainstay of the economy. Glacial action and water erosion have opened potholes (locally called *avens*) in the surface that often lead down to grottoes. The caverns of the Causses du Quercy retain evidences of prehistoric man. The caves of Roquefort on the western edge of the Causses du Larzac are used for the manufacture of the celebrated cheese made from sheep milk. Production is controlled by a cooperative founded in 1880. Sheep rearing is the other prop, after tourism, of the regional economy. Millau, once a wool-weaving centre, makes sheepskin gloves.

caustic, lunar: see silver nitrate.

caustic potash, potassium hydroxide, a potassium salt that readily dissolves in water to form a strongly alkaline and corrosive solution (see potassium).

caustic soda, sodium hydroxide, a white crystalline solid used extensively in the manufacture of soap, rayon, and paper (see sodium).

Cauto River, river in Granma and Santiago de Cuba provinces, eastern Cuba. The island's longest river, it flows for 230 mi (370 km) from its source in the Sierra Maestra westward through alluvial swamps into the Golfo (gulf) de Guacanayabo. Its tributaries include the Salado, Bayamo, and Contramaestre rivers. It is navigable for about 70 mi. Rice, sugarcane, tobacco, and cattle are raised along its course.

Cauvery River, also spelled KĀVERI, sacred river of southern India, rising on Brahmagiri Hill in the Western Ghāts in Coorg district of Karnāta state, flowing in a southeasterly direction for 475 mi (765 km) through Karnāta and Tamil Nādu states, and descending the Eastern Ghāts in a series of great falls. Before emptying into the Bay of Bengal south of Cuddalore, Tamil Nādu, it breaks into a large number of distributaries describing a wide delta called the "garden of southern India." Known to devout Hindus as Dakṣiṇa Gaṅgā (Ganges of the South), it is celebrated for its scenery and sanctity in Tamil literature, and its entire course is considered holy ground. The river is also important for its irrigation-canal projects.

Its uppermost course is tortuous with a rocky bed and high banks under luxuriant vegetation. After passing through a narrow gorge and tumbling 60–80 ft (18–24 m) in the rapids of Chunchankatte, the river widens to 900–1,200 ft across the Karnāta plateau. There, its flow is interrupted by a number of anicuts or weirs. At the Krishnarāja Sāgara, the Cauvery is joined by two tributaries, the Hemāvati and

Lakshmantirtha, and dammed for irrigation, forming a 12-sq-mi (31-sq-km) reservoir.

In Karnāta, the river bifurcates twice, forming the sacred islands of Srirangapatnam and Sivasamudram, 50 mi apart. Around Sivasamudram are the scenic Sivasamudram Falls, comprising two series of rapids, Bhar Chukki and Gagana Chukki, plunging 320 ft and reaching a width of 1,000 ft in the rainy season. The falls supply hydroelectric power to Mysore, Bangalore, and the Kolār Gold Fields, more than 100 mi away.

Upon entering Tamil Nādu, the Cauvery continues through a series of twisted wild gorges until it reaches Hogenakal Falls and flows through a straight, narrow gorge near Salem. There, the Mettūr Dam, 5,300 ft long and 176 ft high, impounds a lake (Stanley Reservoir) of 60 sq mi. The Mettūr Project, completed in 1934, created an important agricultural and industrial area by improving irrigation and providing hydropower.

After sweeping past the historic rock of Tiruchchirāppalli (Trichinopoly), the Cauvery breaks at Srirangam Island, a main pilgrimage centre. There in Thanjavūr (Tanjore) district of Tamil Nādu state, its braided and extensively irrigated deltaic region of about 4,000 sq mi begins. The Grand Anicut was built in the 2nd century at the point where the river divides. A second anicut (1836–38) across the Coleroon, the northern and larger channel, saved the old system from silting and extended irrigation. The open roadsteads of Nāgappattinam and Kārikāl are on the seaward side of the delta. The only navigation on any part of the Cauvery course is in basketwork boats. Its main tributaries are the Kabbani, Amarāvati, Noyil, and Bhavāni rivers.

cava (ritual beverage): *see* kava.

Cava de' Tirreni, town and episcopal see, Salerno province, Campania region, southern Italy, in a rich cultivated valley surrounded by hills, just northwest of Salerno city. Cylindrical towers on the hills are used for shooting pigeons, a tradition derived from Lombardy. Just southwest is the village of Corpo di Cava, with the famous Benedictine abbey of Trinità della Cava, founded in a cave in 1011 by St. Alferius, who had come from Cluny, Fr. Although most of the buildings were modernized in 1796, the Gothic cloisters remain. The archives contain 8th-century parchments, and the library's valuable manuscripts include a 7th-century Visigothic Bible and the 11th-century Lombard Laws; there are also a museum and a picture gallery.

Cava de' Tirreni is a popular resort and centre for international sporting events. Manufactures include textiles, food products, and tobacco. Pop. (1999 est.) mun., 53,385.

Cavafy, Constantine, pseudonym of KONSTANTINOS PÉTROU KAVÁFIS (b. April 17, 1863, Alexandria—d. April 29, 1933, Alexandria), Greek poet who developed his own consciously individual style and thus became one of the most important figures not only in Greek poetry but in Western poetry as well. He lived most of his life in Alexandria, loved English and French literature, and generally spoke English; even his Greek had a British accent.

Cavafy
Dimitri Papadimos

Cavafy wrote much but was his own harsh-critic, publishing only about 200 poems. His most important poetry was written after his 40th year, and with some justification he called himself a "poet of old age." A skeptic, he denied or ridiculed traditional values of Christianity, patriotism, and heterosexuality, though he was ill at ease with his own nonconformity. His language is a strange mixture of the refined and stilted Greek called Katharevusa, inherited from the Byzantines, and the Demotic, or spoken, tongue. His style and tone are intimate and realistic. The lyric treatment he gave to familiar historical themes made him popular and influential after his death. He is well-known to English readers from the many references to his work in Lawrence Durrell's *Alexandria Quartet*. Cavafy's poems were first published without date before World War II and reprinted in 1949. An English translation, *The Poems of C.P. Cavafy*, appeared in 1951.

Cavaignac, Louis-Eugène (b. Oct. 15, 1802, Paris—d. Oct. 28, 1857, Sarthe, Fr.), French general and chief executive during the Revolution of 1848, known for his harsh reprisals against rebelling Parisian workers in June of that year.

Louis-Eugène Cavaignac, detail from an engraving by Alphonse Martinet
By courtesy of the Bibliothèque Nationale, Paris

Cavaignac's father, Jean-Baptiste, was a Jacobin member of the Committee of General Security during the French Revolution (1789–92), and Louis retained his father's strong republican beliefs. His uncle, Jacques-Marie, served the Bourbons and the July Monarchy, which ruled France in 1830–48, and helped Cavaignac regain his appointment in the army, from which he had been dismissed in 1831 because of his republicanism. Nevertheless, he was sent to the relative isolation of Algeria.

Cavaignac performed with distinction during the French conquest of Algeria in the 1840s, and in 1848 he was appointed governor general. Amid the revolutionary activity of that year, he was elected to the legislature in France and appointed minister of war by the provisional government of the newly formed Second Republic. That June there was a large workers' revolt in Paris to protest the expulsion of Socialist leaders from the National Assembly and the closing of the national workshops (government-sponsored employment centres). Cavaignac directed the suppression of the revolt, for which he became known as "the butcher of June." On June 28 the National Assembly named him chief executive of France, but he lost the presidential election to Louis-Napoléon Bonaparte (later Emperor Napoleon III) that December.

Cavaignac remained a leader of the opposition to Bonaparte. He was arrested in 1851, but the next year he was elected to the Corps Législatif. He refused, however, to take an oath of allegiance to the new emperor and thus was denied his seat in the legislature both then and again in 1857.

In 1899 the memoirs and correspondence of Cavaignac and his uncle were published as

Les Deux Généraux Cavaignac. Souvenirs et correspondance (1808–1848).

Cavaillé-Coll, Aristide (b. Feb. 4, 1811, Montpellier, Fr.—d. Oct. 13, 1899, Paris), distinguished French organ builder and initiator of the orchestral style of French organ building and composing.

Descended from a family of organ builders and a talented protégé of his father, Dominique, a well-known builder of Languedoc, he early became a competent and experienced engineer, winning at 22 a prize for the invention of a popular circular saw. At the suggestion of the composer Gioacchino Rossini, Cavaillé-Coll went to Paris in 1833. There he was awarded a contract for a large organ for the basilica of Saint-Denis; completed by 1841, this instrument became in tone and mechanism a model for many later French organs. Napoleon III put Cavaillé-Coll in charge of rebuilding a number of important cathedral organs, and thereafter his fame spread. Eventually over 600 instruments bore his name, a number of them in England, where he had considerable influence.

Among Cavaillé-Coll's contributions to organ building were a number of improvements in mechanism and pipework aimed at making the organ as expressive and versatile as a symphony orchestra. He largely standardized the layout of keyboards and stop controls and achieved excellent balance and uniformity of tone in each set of pipes through careful voicing, while maintaining the strong contrasts of tone colour characteristic of romantic, symphonic organs. Although Cavaillé-Coll successfully imitated the sound of several orchestral instruments, he sacrificed the transparency and clarity of tone that distinguished Baroque organs, so that his instruments are not well-suited, for example, to the music of J.S. Bach. Yet, he influenced a new school of organ composition, and 19th-century composers of the stature of César Franck, Camille Saint-Saëns, Charles-Marie Widor, and Louis Vierne wrote particularly with the Cavaillé-Coll sound in mind. Many of his instruments are still in regular use.

Cavalcanti, Alberto, original name ALBERTO DE ALMEIDA-CAVALCANTI (b. Feb. 6, 1897, Rio de Janeiro—d. Aug. 23, 1982, Paris), Brazilian-born director-producer, screenwriter, and art director of motion pictures in the mid-20th century who spent much of his career in Europe.

Cavalcanti established his reputation as a documentary filmmaker in Britain during the 1930s and went on to produce some notable films for Ealing Studios. In the 1950s he returned to Brazil and was a leading figure in the revival of Brazilian cinema. Cavalcanti studied architecture in Geneva, worked in French cinema as an art director, and in 1926 made the pioneering documentary *Rien que les heures* (1926; "Nothing But Time"), which portrayed the lives of Paris workers during a single day. In 1934 he went to Britain and joined John Grierson on the General Post Office (GPO) Film Unit to make *Pett and Pott* (1934), *Coalface* (1935; with Grierson and W.H. Auden), and *We Live in Two Worlds* (1937). The GPO's productions were important milestones in the development of documentaries. Moving to Ealing Studios in 1941, he produced such wartime propaganda films as *The Foreman Went to France* (1942) and, after 1943, directed the features *Champagne Charlie* (1944), *Nicholas Nickleby* (1947), and *They Made Me a Fugitive* (1947). After returning to Brazil, he made *O Canto do mar* (1952; "The Song of the Sea") and *Mulher de verdade* (1954; "Woman of Truth") with his own company; but he fell under official suspicion because of his left-wing stance and

in 1954 returned to Europe. Cavalcanti eventually settled in France, where he continued his work in television.

Cavalcanti, Guido (b. c. 1255, Florence [Italy]—d. Aug. 27/28, 1300, Florence), Italian poet, a major figure among the Florentine poets who wrote in the *dolce stil nuovo* ("sweet new style") and who is considered, next to Dante, the most striking poet and personality in 13th-century Italian literature.

Born into an influential Florentine family of the Guef (papal) party, Cavalcanti studied under the philosopher and scholar Brunetto Latini, who earlier had been the teacher of Dante. Cavalcanti married the daughter of the rival Ghibelline (imperial) party leader Farinata degli Uberti but joined the White Guef faction when, in 1300, that party split into Blacks and Whites. That same year, Dante, who had dedicated several poems to Cavalcanti and called him his "first friend," apparently was involved in banishing Cavalcanti from Florence. In exile in Sarzana, Cavalcanti contracted malaria and was permitted to return to Florence, where he died.

Cavalcanti's strong, temperamental, and brilliant personality and the poems that mirror it were admired by many contemporary poets and such important later ones as Dante Gabriel Rossetti and Ezra Pound. He left about 50 poems, many addressed to two women: Mandetta, whom he met in Toulouse in 1292, and Giovanna, whom he calls Primavera ("Springtime"). Cavalcanti's poems glow with the brilliance, grace, and directness of diction characteristic of the style at its best. Love is the poet's dominant theme, generally love that causes deep suffering.

Two of Cavalcanti's poems are canzoni, a type of lyric derived from Provençal poetry, of which the most famous is "Donna mi prega" ("A Lady Asks Me"), a beautiful and complex philosophical analysis of love, the subject of many later commentaries. Others are sonnets and ballate (ballads), the latter type usually considered his best. One of his best-known ballate was also one of his last, written when he went into exile: "Perch'io non spero di tornar giamai" ("Because I hope not ever to return"), a line that some hear echoed in T.S. Eliot's refrain from "Ash Wednesday," "Because I do not hope to turn again."

Cavalcanti's poetry was first collected in 1527 and later in *Le rime de Guido Cavalcanti* (1902). Many poems were translated by Dante Gabriel Rossetti in *The Early Italian Poets* (1861; later retitled *Dante and His Circle*) and by Ezra Pound in *The Sonnets and Ballate of Guido Cavalcanti* (1912).

Cavalcaselle, Giovanni Battista (b. Jan. 22, 1820, Legnago, kingdom of Lombardy and Venetia [Italy]—d. Oct. 31, 1897, Legnago, Italy), writer on art and, with Giovanni Morelli (*q.v.*), founder of modern Italian art-historical studies.

A student at the Academy of Fine Arts in Venice, Cavalcaselle from early youth studied the art treasures of Italy. In Germany (1846–47), he met another art enthusiast, the Englishman J.A. Crowe, and they studied together in Berlin. On his return to Venice Cavalcaselle took an active part in the Revolution of 1848 against Austrian rule. He was arrested by Austrian gendarmes and narrowly escaped being shot. He then joined the forces of Giuseppe Garibaldi and was taken prisoner by the French in 1849. He arrived in miserable plight in Paris, where by good fortune he again met Crowe, and with his help he went to London. The two friends worked on a history of early Flemish painters (1857). In 1864 Crowe and Cavalcaselle published their great work, *A New History of Italian Painting*, which was followed by the *History of Painting*

in North Italy. Other joint works were *Titian* (1877) and *Raphael* (1882–85). Cavalcaselle's sketchbooks and notes, preserved in the Marciana library in Venice, are evidence of his method and range of knowledge.

Cavalcaselle was for some time secretary to Giovanni Morelli and was his traveling companion when Morelli compiled the inventory of the works of art in the Marches of Ancona for the Italian government. Toward the end of his life Cavalcaselle was inspector of fine arts in the Ministry of Education in Rome.

cavalier (from Late Latin *caballarius*, "horseman"), originally a rider or cavalryman; the term had the same derivation as the French *chevalier*. In English the word knight was at first generally used to imply the qualities of chivalry associated with the *chevalier* in French and with the kindred *cavaliere* in Italian and *caballero* in Spanish. "Cavalier" in English, however, had the pejorative sense of "swashbuckling" or "overbearing."

In the English Civil Wars (1642–51), the name was adopted by Charles I's supporters, who contemptuously called their opponents Roundheads; at the Restoration, the court party preserved the name Cavalier, which survived until the rise of the term Tory.

Cavalier, Jean (b. Nov. 28, 1681, near Rihaute, Fr.—d. May 17, 1740, London, Eng.), leader of the French Huguenot insurgents known as the Camisards from 1702 to 1704.

The son of a Huguenot shepherd from the Languedoc region of southern France, Cavalier sought refuge in Geneva in 1701 to escape a wave of severe persecution of Protestants by the government of King Louis XIV. He returned to his native area and found work as an apprentice baker shortly before the local Huguenots' Camisard revolt broke out at Le Pont-de-Montvert on July 24, 1702. Several months later Cavalier emerged as the leader of the uprising, which swept through Languedoc and the Cévennes. His genius at guerrilla warfare enabled him to defeat government forces at Vagnas on Feb. 10, 1703, and soon he was threatening Nîmes. On March 4, 1704, he defeated one of Louis XIV's finest regiments at Martignargues. A serious reverse at Nages (April 16, 1704) and the loss of his arsenal at Euzet (April 19) forced him to agree to a truce at Pont-d'Avesnes on May 12. He made his submission at Nîmes four days later, but his followers deserted him when he failed to secure religious liberty from the government. On August 26 he fled to Switzerland; by early 1705 the revolt had lost its force.

Cavalier fought with the British against the French in Portugal and Spain in 1707 and eventually retired to a Huguenot colony in Ireland. His *Memoirs of the Wars of the Cévennes* was published at Dublin in 1726. In 1735 he was made a brigadier in the British army. Appointed lieutenant governor of Jersey in 1738, he became a major general the following year.

Cavalier Parliament (May 8, 1661—Jan. 24, 1679), the first English Parliament after the Restoration of Charles II to the throne. It was originally enthusiastically royalist in tone, but over the years its membership changed and it became increasingly critical of many of Charles's policies. The Cavalier Parliament is best known for the harsh laws it enacted against Roman Catholics and Protestant Dissenters.

Cavalier poet, any of a group of English gentlemen poets, called Cavaliers because of their loyalty to Charles I (1625–49) during the English Civil Wars, as opposed to Roundheads, who supported Parliament. They were also cavaliers in their style of life and counted the writing of polished and elegant lyrics as only one of their many accomplishments as soldiers, courtiers, gallants, and wits. The term embraces Richard Lovelace, Thomas Carew,

Sir John Suckling, Edmund Waller, and Robert Herrick. Although Herrick, a clergyman, was detached from the court, his short, fluent, graceful lyrics on love and dalliance, and his *carpe diem* ("seize the day") philosophy ("Gather ye rose-buds while ye may") are typical of the Cavalier style. Besides writing love lyrics addressed to mistresses with fanciful names like Anthea, Althea, Lucasta, or Amarantha, the Cavaliers sometimes wrote of war, honour, and their duty to the king. Sometimes they deftly combined all these themes as in Richard Lovelace's well-known poem, "To Lucasta, Going to the Wars," which ends,

I could not love thee, dear, so much
Loved I not honour more.

Cavaliere, Emilio del, also spelled EMILIO DEI CAVALIERI (b. c. 1550, Rome [Italy]—d. March 11, 1602, Rome), Italian composer and one of the earliest to compose dramatic music.

A nobleman, he became supervisor of fine arts and entertainments at the court of the grand duke Ferdinand I of Tuscany. He was a member of the Camerata in Florence, a group whose theories gave rise to the first operas. He composed intermezzi and pastorals, which stood midway between the masquelike intermezzi and true operas. Historically, his most significant work is *La rappresentazione di anima e di corpo* (*Representation of Soul and Body*), an allegorical morality play. Important as a precursor of opera and of oratorio, it had characteristics of both. Published in 1600, it contained the earliest printed examples of figured bass. Although it was surpassed in musical and dramatic intensity by the first true operas (those of Jacopo Peri and Giulio Caccini), it was one of the earliest examples of the monodic recitative style that blossomed in early opera.

Cavaliere D'ARPINO, original name GIUSEPPE CESARI, also called IL GIUSEPPINO (b. c. 1568, Arpino, Kingdom of Naples [Italy]—d. 1640, Rome), Italian painter of the post-Renaissance school known as Mannerist, who helped to spread that school abroad.

"Christ with St. John the Baptist," painting from "Scenes from the Life of St. John the Baptist," by Cavaliere d'Arpino, 1597–1601; in the Church of San Giovanni in Laterano, Rome

A major influence on Arpino's early work was Cristoforo Roncalli, the Mannerist fresco painter of the Vatican and the Quirinal Palace. In 1589–91 Arpino executed extensive decorations in the Church of San Martino, Naples, where, as at Rome, he was assisted by his brother Bernardino. He was greatly in demand in Rome as a fresco painter, having impressed Pope Clement VIII with his facility of execution. But his frescoes in the Palazzo dei Conservatori, begun in 1596, were never finished. Perhaps his best work is the four incidents from the life of St. John the Baptist in the Church of San Giovanni in Laterano, Rome. During his long career, he also created the designs for the mosaics of the cupola of St. Peter's; the frescoes of the Cappella Paolina of the Church of Santa Maria Maggiore; and the fine murals in the Ogliate chapel in the Church of Santa Prassede. Although of wide reputation, Arpino did not compare in originality to contemporaries such as Caravaggio, the Carracci, or even some of his own students.

Cavaliere di Candia, Mario (singer): see Mario, Giovanni Matteo.

Cavalieri, (Francesco) Bonaventura (b. 1598, Milan [Italy]—d. Nov. 30, 1647, Bologna, Papal States), Italian mathematician who made developments in geometry that were precursors to integral calculus.

As a boy Cavalieri joined the Jesuit, a religious order (sometimes called "Apostolic Clerics of St. Jerome") that followed the rule of St. Augustine and was suppressed in 1668 by Pope Clement IX. Euclid's works stimulated his interest in mathematics, and, after he met Galileo, Cavalieri considered himself a disciple of that great astronomer.

By 1629, when he was appointed professor of mathematics of the University of Bologna, Cavalieri had completely developed his method of indivisibles, a means of determining the size of geometric figures similar to the methods of integral calculus. He delayed publishing his results for six years out of deference to Galileo, who planned a similar work. Cavalieri's work appeared in 1635 and was entitled *Geometria Indivisibilibus Continuatorum Nova Quadam Ratione Promota* ("A Certain Method for the Development of a New Geometry of Continuous Indivisibles"). As stated in his *Geometria*, the method of indivisibles was unsatisfactory and fell under heavy criticism, notably from the contemporary Swiss mathematician Paul Guldin. In reply to this criticism, Cavalieri wrote *Exercitationes Geometricae Sex* (1647; "Six Geometrical Exercises"), stating the principle in the more satisfactory form that was widely employed by mathematicians during the 17th century.

Cavalieri was largely responsible for introducing the use of logarithms as a computational tool in Italy through his book *Directorium Generale Uranometricum* (1632; "A General Directory of Uranometry"). His other works include *Lo specchio istorico ouero trattato delle sezioni coniche* (1632; "The Burning Glass; or, A Treatise on Conic Sections") and *Trigonometria plana et sphaerica, linearis et logarithmica* (1643; "Plane, Spherical, Linear, and Logarithmic Trigonometry").

Cavalla River, also called **CAVALLY**, **YOU-BOU**, or **DIUGOU**, river in western Africa, rising north of the Nimba Range in Guinea and flowing south to form more than half of the Liberia-Côte d'Ivoire border. It enters the Gulf of Guinea 13 miles (21 km) east of Harper, Liberia, after a course of 320 miles (515 km). With its major tributaries (the Duobe and the Hana), it drains an area of 11,670 square miles (30,225 square km). Named by 15th-century Portuguese navigators for the cavalla (horse mackerel) found at its mouth, it is navigable to Nyaake, 50 miles (80 km) upstream.

Cavalli, (Pier) Francesco, original name **PIER FRANCESCO CALETTI-BRUNI** (b. Feb. 14, 1602, Crema, republic of Venice [Italy]—d. Jan. 14, 1676, Venice), the most important Italian composer of opera in the mid-17th century.

The son of Gian Battista Caletti-Bruni, he assumed the name of his Venetian patron Federico Cavalli. In 1617 he became a singer in the choir of St. Mark's, Venice, under Claudio Monteverdi, whose opera *Orfeo* established opera as a permanent genre. Cavalli subsequently held various posts there, becoming *maestro di cappella* in 1668. During his lifetime he exercised a considerable influence on European taste. *Didone* (1641) is perhaps his most interesting work, but it was his *Egisto*, given in Paris in 1646, that initiated the rivalry between French and Italian styles. As a dramatic composer Cavalli wrote for a small string orchestra, and his operas require no trained chorus. He wrote few concerted numbers for soloists, but his works have signs of the beginnings of the formal recitative aria technique, sometimes even with a da capo section. Compensation for the level character of his operatic music was provided by the brilliant costumes and lavish sets, without which, in spite of their dramatic power and grotesque humour, Cavalli's works are incomplete. Although performed throughout Italy, these *dramma per musica* were generally written especially for the public opera houses that flourished in 17th-century Venice. Twenty-seven of his 42 operas are preserved in manuscript in the library of St. Mark's, and renewed interest in Cavalli has resulted in numerous revivals, recordings, and publications of his operas. *Erismena* and *L'Ormino* have been recorded, and various others have been excerpted and recorded.

Cavallini, Pietro (b. c. 1250, Rome [Italy]—d. c. 1330), Roman fresco painter and mosaicist whose work represents the earliest significant attempt in Italian art to break with Byzantine stylizations and move toward a

St. Stephen and Guida Taddeo, detail from the fresco "Last Judgment," by Pietro Cavallini, c. 1291–93; in the Church of Santa Cecilia in Trastevere, Rome

SCALA—Art Resource/EB Inc

plastic, illusionistic depiction of figures and space. He was an important influence on the innovatory Florentine painter Giotto (d. 1337).

Cavallini's first authenticated work is a series of fresco decorations of the nave of San Paolo Fuori le Mura in Rome, done between 1277 and 1290. These were painted over the outlines of early Christian frescoes of the 5th century in an effort to "restore" them. Both

Cavallini's works and the few earlier frescoes that he did not replace perished in a fire in 1823. Copies of both survive, however, and the spacious monumentality and classical affinities of the 5th-century works seem to have had a profound effect on forming Cavallini's style.

In 1291 he began his major series of mosaics, scenes from the life of the Virgin for Santa Maria in Trastevere, Rome, which show a definite classical mood. The superficial conventions of Byzantine facial types and gesture persist, but Byzantine linear treatment of draperies is severely reduced in favour of rounded modeling, and the traditional linear definition of facial features is completely abandoned. There is a strikingly new spatial clarity and sculptural approach to the figures and a use of light that is unprecedented in Italian art; the light strikes the figures from one direction and serves to mold and reveal, rather than decorate, the form.

At some time in the early 1290s Cavallini executed his most famous works, a Last Judgment fresco, frescoes of Old Testament scenes (only fragments survive), and an Annunciation in Santa Cecilia in Trastevere in Rome. Here the classicizing elements of his mosaics are consolidated in a powerful and grandly expressive style best illustrated by a beautiful and lively group of seated Apostles, highly individualized, whose solidity of form is completely successful in defining the space around them. A further important feature is the use of soft, rich colour harmonies and shading.

In 1308 Cavallini was invited to Naples by Charles of Anjou; there he came into contact with the graceful forms of Gothic art of the northern Anjou country. In about 1315 he returned briefly to Rome to decorate the facade of San Paolo Fuori le Mura with frescoes (now destroyed). He had many pupils who carried on his tradition.

Cavallotti, Felice (Carlo Emmanuele) (b. Dec. 6, 1842, Milan [Italy]—d. March 6, 1898, Rome), left-wing, antimonarchist journalist and political leader, sometimes called Italy's "Poet of the Democracy."

In 1860 he joined the Expedition of the Thousand volunteers who fought with the patriot general Giuseppe Garibaldi in Sicily, and he volunteered again in 1866. More importantly, that year he founded the journal *Gazzettino rosa*, in which he gained fame with his articles lampooning the monarchists. He was also a serious scholar and translated the critical life of Jesus, *Das Leben Jesu kritisch bearbeitet* (1835–36), by the German theologian David F. Strauss.

Cavallotti's political activism led to his election (1873) to the Chamber of Deputies, where he continued to fight for democratic reform and to criticize his right-wing opponents, especially Agostino Depretis and Francesco Crispi, until his death. His fighting was not limited to parliamentary debates, however. His temper and zeal led him to participate in several duels, the last of which was fatal: he was killed by Ferruccio Macola, editor of the *Gazzetta di Venezia*.

Cavally River (western Africa): see Cavalla River.

cavalry, military force mounted on horseback, formerly an important element in the armies of all major powers. When employed as part of a combined military formation, its main duties included observing and reporting information about the enemy, screening movements of its own force, pursuing and demoralizing a defeated enemy, maintaining a constant threat to an enemy's rear area, striking suddenly at detected weak points, turning exposed flanks, and exploiting a penetration

or breakthrough. During the latter part of the 19th century, largely as a result of the introduction of repeating rifles and machine guns, cavalry lost much of its former value.

By the time of World War I, a cavalry charge against a line of entrenched troops armed with rapid-firing small arms was suicidal. Cavalry organizations soon abandoned horses for armoured fighting vehicles and became known as mechanized cavalry or armoured cavalry, but even the name was eventually dropped. By the 1950s there were no horse-mounted cavalry units in either the U.S. or British armies. In the early 1960s the United States converted its 1st Cavalry Division to an "air mobile" division, with helicopters and air-portable weapons and vehicles. The division saw extensive service in Vietnam.

Cavan, Irish AN CABHÁN (The Hollow Place), one of the three counties of the old province of Ulster, but now part of the Irish republic. With an area of 730 sq mi (1,891 sq km), it is bounded by Counties Monaghan (northeast), Meath, Westmeath, and Longford (south), and Leitrim (northwest). Northern Ireland lies to the north. Northwestern Cavan comprises uplands, intersected by valleys, declining toward the main valley of the River Erne, where the main features are the drumlins (long, oval mounds) that alternate with lakes, rivers, peat bogs, and pastures. East of the Erne Valley is a line of slate and shale hills.

The Cavan district is mentioned in accounts of the life of St. Patrick (flourished 5th century). Cavan formed part of the kingdom of Bréifne, which included Leitrim, of which the O'Rourke were princes. In later times Cavan, or East Bréifne, became distinctively Bréifne O'Reilly; and West Bréifne, or Leitrim, became Bréifne O'Rourke. Bréifne long resisted colonization by the Anglo-Normans, and the O'Reilly's of Cavan were not brought under permanent English rule until the late 16th century. Cavan, previously part of Connacht, was designated a part of Ulster in the early 17th century and included in the Ulster plantation from 1608 onward, when it was settled by Scots and English colonists.

Only one-quarter of the people of Cavan live in villages and towns; Cavan, the county seat, Coothill, and Belturbet are the largest. The Roman Catholic cathedral of Kilmore diocese is in Cavan, the Protestant cathedral in Kilmore. Farms in Cavan average 30–40 ac (12–16 ha); and one-tenth of the improved land is used for crops, one-fifth for hay, and the rest for pasture. Creameries are common, and the towns are market centres with industries such as plastics, food processing, synthetic fibres, and wallpaper manufacturing. Main roads converge on Cavan from Belfast, Dublin, and Athlone. Pop. (1986) 53,965.

cavatina, musical form appearing in operas and occasionally in cantatas and instrumental music. In early 18th-century cantatas, notably those of J.S. Bach, the cavatina was a short, epigrammatic piece sometimes sung between the speech-like recitative and the more lyric arioso. In opera the cavatina is an aria, generally of brilliant character, sung in one or two sections without repeats. It developed in the mid-18th century, coincident with the decline of the previously favoured da capo aria (in which the musical form is ABA, with the repeated A section given improvised variations). Examples occur in the operas of Mozart, Weber, and Rossini. "Cavatina" is also used as the title of songlike instrumental works, e.g., in Beethoven's *String Quartet*, Opus 130.

cave, any naturally formed subterranean cavity, including lava tubes and marine grottos. In many cases, a cave consists of a number of underground chambers, constituting a series

of caverns. An assemblage of such caverns interconnected by smaller passageways makes up a cave system.

A brief treatment of caves follows. For full treatment, see MACROPAEDIA: Continental Landforms.

Caves can be classified into two broad types according to origin: primary and secondary. Primary caves develop during the time when the host rock is solidifying. Those of the secondary variety originate after the host rock has been deposited or consolidated. Most caves are of the latter type. In certain instances, primary cavities are enlarged or further developed over geologic time by the mechanisms associated with secondary cave formation.

Primary caves. These are best exemplified by lava tubes, cylindrically shaped tunnels that extend along the path of a lava field. Most caves of this type consist of a single, unbranched tunnel, but a few divide at intervals to form interweaving side passages that either rejoin the main channel or end in rockfall. Lava tubes are thought to form when the surface of a lava flow cools and solidifies. As the still molten interior of the lava field drains off, it leaves behind the distinctive cylindrical cavity. The pressure required to sustain the ceiling of the cavity is provided by hot gases. In some cases, the pressure of these fluids produces high, domed ceilings, whereas in others excessive pressure causes the gases to break through the roof to form crater-like vents. Lava tubes have various other characteristic properties, as for example lava pendants resembling stalactites that result from the drip-page of the cooling ceiling or from remelting by hot gases.

Another significant type of primary cave is the coral cave. Such cavities are formed when colonies of coral in shallow waters expand and unite, forming lacy or bulbous walls around a submarine void. When the shoreline rises or the sea level falls, a coral cave is exposed to wave action and weathering, which enlarges the void or obliterates it entirely.

Secondary caves. Cavities of this kind are produced by mechanical and chemical processes. Although both types of processes are generally involved, one or the other tends to predominate.

One common form of secondary cave of mechanical origin is the marine grotto. Such a cave develops where a sea cliff is exposed to wave action. Hydrodynamic pressure changes within the waves pull apart sections of the cliff face weakened by fracturing. Rock fragments and sand particles carried by the waves grind away soft rock material. Similar kinds of caves are quarried along the banks of streams and rivers by the mechanical action of water laden with silt and gravel.

The most common type of secondary cave and of caves in general are those created by the chemical dissolution of a soluble host rock that has been weakened by fracturing and mechanical erosion. Mammoth Cave, Kentucky, and Carlsbad Caverns, New Mexico, are typical examples of such solution caves. Enormous cavities of this kind result when groundwater containing certain natural acids (e.g., those formed by the dissociation of water and carbonic acid) circulates along joints and faults in a calcareous rock such as limestone or dolomite and dissolves and corrodes it. This process, which occurs below the water table, gradually produces the honeycomb of passages and galleries characteristic of solution caves. As the water table drops and the cavities are drained, various kinds of speleothems, including stalactites, stalagmites, draperies, flowstones, and helictites are formed by the deposition of the carbonate minerals that had been dissolved from the surrounding limestone or dolomite.

cave bear, extinct species (*Ursus spelaeus*) of bear, notable for its habit of inhabiting caves,

where its remains are frequently preserved; in European cave deposits, the remains of more than 100,000 cave bears have been found.

European cave bear (*Ursus spelaeus*)

By courtesy of the American Museum of Natural History, New York

The cave bear is best known from late Pleistocene cave deposits, although it can be traced back to earlier Pleistocene times (the Pleistocene Epoch began 2,500,000 years ago and ended 10,000 years ago). Remains have been found in England, Belgium, Germany, Russia, Spain, Italy, and Greece, and it may have reached North Africa. Several local varieties, or races, have been described; dwarf races are known from some regions. Stone Age peoples sometimes hunted the cave bear, but evidence of this hunting is very sporadic; it is highly unlikely that hunting by man caused its extinction. It appears likely that most cave bears died in the severe glacial winters during hibernation; the remains include a large proportion of very young or very old and many specimens showing unmistakable signs of illness or disease. Extinction of the cave bear seems to have been a gradual process that was complete at the close of the last glacial episode. The cave bear was probably as large as the Kodiak bears of Alaska, the largest bears of today. The head was very large, and the jaws bore distinctive teeth. It has been inferred that the animal was largely vegetarian.

cave cricket: see camel cricket.

cave deposit, also called SPELEOTHEM, any of the crystalline deposits that form in a solution cave after the creation of the cave itself. These deposits are generally composed of calcium carbonate dissolved from the surrounding limestone by groundwater. Carbon dioxide carried in the water is released as the water encounters the cave air; this reduces the water's capacity to hold calcite in solution and causes the calcite to be deposited. These deposits may accumulate to form stalactites, stalagmites, flowstone, helictites, cave pearls, and many other formations. Deposits formed along ceiling cracks may produce drip curtains or draperies that may then reach the floor to become walls. Speleothems may grow in pools to form the nodular encrustations of cave coral or the natural dams that continually elevate themselves through accretion of calcite. The pure white of the calcium carbonate is often tinted with hues of red, yellow, and gray and may even be translucent. The growth rate of speleothems is highly variable due to seasonal variations in the rate of flow, carbon dioxide content, and other factors. Caves owe most of their beauty and much of their interest to these secondary growths.

cave fish, any of the pale, blind, cave-dwelling fishes of the genera *Amblyopsis* and *Typhlichthys*, family Amblyopsidae. Cave fishes are small, growing to about 10 cm (4 inches) long, and are found in fresh water in dark limestone caves of the United States. There are three species: *Typhlichthys subterraneanus*, *Amblyopsis rosae*, and *A. spelaea*. The first two lack pelvic fins; the third, the blind fish

of Mammoth Cave, Kentucky, possesses these fins. All have small but nonfunctional eyes, and tactile organs that are sensitive to touch; these are arranged over the body, head, and tail and enable the fish to feel what it cannot see. Contrasting with these fishes are the swampfish (*Chologaster*), which belong to the same family. They are also small but are pigmented and have functional eyes. They live

above ground in North American swamps and streams.

Other cave-dwelling fishes unrelated to the Amblyopsidae have, in adapting to their habitat, also tended toward blindness and pale colouring. In Cuba and Yucatán, there are

three species of brotula (family Ophidiidae or Brotulidae) found in caves. Among the large superorder Ostariophysii (minnows, carps, and catfish), one of the best known is *Astyanax*

Cave fish (*Amblyopsis rosae*)
Ron Church—Tom Stack and Associates

(or *Anoptichthys jordani*, an eyeless, 7.5-centimetre characin (family Characidae) found in Mexico and often kept in home aquariums. Others include *Caecobarbus geertsii*, an African member of the minnow family (Cyprinidae), and certain catfish belonging to several families and found in the United States, Mexico, South America, and Africa.

cave pearl, small, almost spherical concretion of calcite that is formed in a pool of water in a cave and is not attached to the surface on which it forms. Occasionally saturated water drips into small pools with such vigour that a stalagmite cannot form. A bit of foreign matter may become coated with calcite, and slight movements of the water may keep the bit in motion while new layers of calcite are added. Concentric layers are added and polished in this way until the cave pearl becomes too large to remain in motion and becomes attached.

caveat emptor (Latin: "let the buyer beware"), in the law of commercial transactions, principle that the buyer purchases at his own risk in the absence of an express warranty in the contract.

As a maxim of the early common law, the rule was well suited to buying and selling carried on in the open marketplace or among close neighbours. The increasing complexity of modern commerce has placed the buyer at a disadvantage. He is forced to rely more and more upon the skill, judgment, and honesty of the seller and manufacturer.

The modern law of commercial transactions recognizes this and protects the buyer by implying various exceptions to the principle of caveat emptor. Thus, in the case of a sale by sample, the law implies a condition in the contract that the bulk of the merchandise will correspond with the sample in quality and that the buyer will have a reasonable opportunity to examine the bulk of the merchandise. Likewise, when the buyer has made known to the seller the particular purpose for which the goods are required, the law implies a condition in the ensuing contract that the merchandise is of merchantable (average) quality and reasonably fit for the intended purpose.

Cavelier, René-Robert (French explorer); see La Salle, René-Robert Cavelier, Sieur de.

Cavell, Edith (Louisa) (b. Dec. 4, 1865, Swardston, Norfolk, Eng.—d. Oct. 12, 1915, Brussels, Belg.), English nurse who became a popular heroine of World War I and was executed for assisting Allied soldiers to escape from German-occupied Belgium.

Cavell entered the nursing profession in 1895 and in 1907 was appointed the first matron of the Berkendael Institute, Brussels, where she greatly improved the standard of nursing.

After the German occupation of Belgium, she became involved in an underground group formed to help British, French, and Belgian soldiers reach The Netherlands, a neutral country. The soldiers were sheltered at the Berkendael Institute, which had become a Red Cross hospital, and were provided with money and guides by Philippe Baucq, a Belgian. About 200 men had been aided when, in August 1915, Cavell and several others were arrested.

The group was brought before a court-martial on Oct. 7, 1915. On October 9, Cavell, after making a full confession, was sentenced to death. Three days later she and Baucq were shot, despite the efforts of the U.S. and Spanish ministers to secure a reprieve. Though legally justified, her execution on a charge

Edith Cavell

that did not include espionage was considered outrageous and was widely publicized by the Allies.

Cavendish: see Jones, Henry.

Cavendish, unincorporated rural community, Queens county, on the central northern coast of Prince Edward Island, Canada, 24 miles (39 km) northwest of Charlottetown. It lies near a sandy beach (called Penamkeak by the Micmac Indians and now a popular bathing place) at the western end of Prince Edward Island National Park (*q.v.*). Probably named about 1772 for Field Marshal Lord Frederick Cavendish, the place was used by Lucy Maud Montgomery as the setting (Avonlea) for her novel *Anne of Green Gables* (1908) and its sequels. The Green Gables farmhouse (her girlhood home) is a tourist attraction, and Montgomery is buried nearby. Summer tourism is the basic economic activity. Pop. (1991) 179.

Cavendish, Lord Frederick Charles (b. Nov. 30, 1836, Eastbourne, Sussex, Eng.—d. May 6, 1882, Dublin, Ire.), British statesman, protégé of William Ewart Gladstone, who was murdered by Irish nationalists the day after his arrival in Dublin as chief secretary to the lord lieutenant of Ireland and as a goodwill emissary from England, at the height of the Irish crisis in 1882.

The second son of the 7th Duke of Devonshire, Cavendish entered Parliament in 1865. The year before he had married Mrs. Gladstone's niece, Lucy, daughter of the 4th Baron Lyttelton. Gladstone came to admire and trust Lord Frederick, especially after taking him as private secretary in 1872, and looked to him as the future leader of the parliamentary Liberal Party. Lord Frederick was financial secretary to the Treasury from 1880, and as such he was the right-hand man of Gladstone, chancellor of the Exchequer as well as prime minister.

Gladstone then asked him to undertake the thankless and dangerous office of chief secretary for Ireland. Lord Frederick crossed to Dublin on the night of May 5, 1882. The following evening he walked across Phoenix Park with Thomas H. Burke, the permanent undersecretary for Ireland. Burke was attacked

by a party of Irishmen armed with knives; Cavendish tried to defend him, and both were killed. Five of their assassins, members of a secret society, the Invincibles, were betrayed and hanged in 1883; several others were sentenced to long prison terms.

Cavendish, George (b. 1500—d. 1561/62), English courtier and writer who won a minor but lasting reputation through a single work, his *Life of Cardinal Wolsey*, a landmark in the development of English biography, an important document to the student of Tudor history, and a rare source of information on the character of the author himself. Cavendish applied to his subject methods of concrete observation in matters of behaviour, gesture, and speech, so that in his shapely and unaffected narrative the figure of the cardinal emerges with an air of life. Besides thus anticipating later biographical principles, Cavendish, though still close to medieval tragedy in conceiving Wolsey's rise and fall as governed by Fortune's wheel, moved away from the older idea that biographies should deal only with saints or royal personages.

About 1526 Cavendish entered Wolsey's service as a gentleman usher and remained loyal to him from the height of his power to his rapid fall under the disfavour of Henry VIII. This position of trust afforded Cavendish a valuable eyewitness impression of the cardinal, especially in his final days of crumbling magnificence. After Wolsey's death in 1530 Cavendish left public employment and retired to Suffolk, where in 1557 he completed his *Life*, undertaken in his later years partly with the intention of supplying a truthful report of the cardinal's career.

Although the fact that Cavendish was a Roman Catholic and his mention of dangerous political issues obstructed the printing of the complete *Life* during the reign of Elizabeth I, its factual and literary value caused it to circulate freely in manuscript, and it thus provided a source for chronicles such as those of John Stow and Raphael Holinshed, for poems, and for plays such as William Shakespeare's *Henry VIII*. The first printed version, published in 1641, *The Negotiations of Thomas Wolsey*, was so mangled by party propagandists as to render it a polemical tract; and the reissue of this bad text throughout the rest of the 17th and 18th centuries fostered the idea that it was a controversial work. Not until 1810 did Christopher Wordsworth attempt to restore the original by issuing in his *Ecclesiastical Biography* a text based upon original manuscripts. In 1815 S.W. Singer published a more completely restored text. At this time also the authorship, long attributed to George Cavendish's brother William, was correctly assigned to George by internal evidence.

Cavendish, Henry (b. Oct. 10, 1731, Nice, France—d. Feb. 24, 1810, London, Eng.), English physicist and chemist who conducted experiments in diverse fields, discovering such phenomena as the composition of air, the nature and properties of hydrogen, the specific heat of certain substances, the composition of water, and various properties of electricity. He also measured the density and mass of the Earth by a method now known as the Cavendish experiment.

Education. Cavendish was a descendant of two great families, with the Duke of Devonshire and the Duke of Kent as his grandfathers. His mother died in 1733, after giving birth to his brother Frederick. In 1742 he entered the Hackney seminary near London, and during 1749–53 he was at Peterhouse College at the University of Cambridge, but he did not take a degree, possibly because he balked at the required declaration of adherence to the Church of England. After a tour of the Continent, he lived in London with his father until the latter's death in 1783. It was during this period that he carried out all of his electrical,

Henry Cavendish, drawing by William Alexander; in the British Museum

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd.

and most of his chemical, researches, starting as an assistant to his father, whose own experimental skill was remarkable enough to draw the praise of Benjamin Franklin. Father and son lived in relatively modest circumstances at first, but when Henry Cavendish was 40 he became a millionaire through the inheritance of a fortune that made him, according to Jean-Baptiste Biot, a contemporary French scientist, "the richest of all learned men, and very likely also the most learned of all the rich."

His wealth made little difference to his style of living. As before, most of his expenditures went for scientific apparatus and books; in time he accumulated a large library, which he then made available to other scientists. To the outside world he appeared to be a shabby, eccentric man who spoke little and then only hesitatingly in a shrill, thin voice. One aspect of his shyness is revealed in an incident later adapted by Aldous Huxley and ascribed to a character in the novel *Point Counter Point* (1928). It occurred when his banker called on Cavendish to suggest the investment of a portion of his funds and was ungraciously told by Cavendish never to plague him again about the growing balance: "If it is any trouble to you, I will take it out of your hands!" Except at meetings of fellow scientists, he almost never appeared in public and was so pronounced a misogynist that he communicated with his housekeeper by daily notes and ordered all female domestics to keep out of his sight. Not only did he not marry, he apparently never formed a sympathetic attachment with any person outside of his family. The costume he usually wore consisted of a faded, crumpled violet suit of an earlier time, with a high collar and frilled cuffs, and a three-cornered hat. Even among fellow scientists he was so taciturn as to lead Lord Brougham, who knew him, to remark that he

probably uttered fewer words in the course of his life than any man who ever lived to fourscore years, not at all excepting the monks of La Trappe.

Cavendish's scientific intellect was of a calibre that appears rarely. For all that, he lacked popular acclaim. In part this lack was the re-

sult of his own disdain for public reputation, although he did accept such honours as being made fellow of the Royal Society (1760) and being elected one of the eight foreign associates of the Institut de France (1803). Though he did write for publication, beginning with a three-part paper on the preparation of various gases in 1766, he also completed many researches without publishing the details and sometimes baffled contemporaries by using the results of his own unpublished work in papers describing subsequent work.

Research in chemistry. Experiments on gases form the bulk of his chemical researches. In addition to being among the first to recognize hydrogen, which he called inflammable air, as a separate substance, and performing ingenious experiments with carbon dioxide, then called fixed air, he noted that a small residue remained when air was decomposed into oxygen and nitrogen; this finding was crucial in the discovery of argon and other inert gases more than a century later. He also made other contributions to chemical theory and anticipated later scientists in unpublished experiments with arsenic acid.

Cavendish's experiments on air, described in 1784-85, led to the discovery that water is not an element but a compound and to the discovery of nitric acid. Joseph Priestley, an English scientist, had noted that when a mixture of hydrogen and air is exploded by means of an electric spark—a method that had been proposed a few years before—the walls of the vessel are covered with moisture, a fact that Priestley disregarded. By a careful repetition of Priestley's experiment, Cavendish concluded that this moisture was mainly water. An analogous conclusion was reached at about the same time by James Watt, the Scottish engineer, and communicated to Priestley and to the Royal Society. The great controversy that ensued over priority of discovery was complicated by the fact that authors of papers, and editors, too, had the right to interpolate additions between the reading of the paper and its publication, and that during this particular interval the Royal Society elected a new secretary who had previously assisted Cavendish in some of his experiments. Much of the earliest biography of Cavendish by George Wilson (1851) is taken up with this controversy over who had discovered the fact that when hydrogen burned in air, water was formed. The principals themselves resolved their differences amicably after Watt was made fellow of the Royal Society in 1785.

Experiments with electricity. The electrical researches of Cavendish were equally remarkable and, had they been published, would alone have brought him fame. Cavendish discovered for himself that the force between a pair of electrical charges is inverse to the square of the distance between them, a basic law of electrostatics subsequently established by a French physicist, C.A. Coulomb, and known by his name. Cavendish anticipated Michael Faraday in demonstrating that the capacity of a condenser depends on the substance inserted between its plates. He freely used the concept of potential (then called degree of electrification, from the practice of measuring it by noting the angle formed between the two gold leaves of an electrometer when they become charged and repel one another), well known in mathematics but not previously used in connection with electrical experiments, in developing the idea that all points on the surface of a good conductor are at the same potential with respect to a common reference, the Earth. This concept, first made explicit by Cavendish, was of paramount importance for the further development of electrical theory. Finally, in a series of experiments on various conductors, he discovered that the potential across them was directly proportional to the current through them, thus anticipating the

law enunciated by Georg Simon Ohm, a German physicist, in 1827. The last finding was the more remarkable since Cavendish had no means of measuring current and managed only by turning his own body into a meter, estimating the strength of the current by grasping the ends of the electrodes with his hands and noting whether he could feel the shock in his fingers, up to his wrists, or all the way up to the elbows. All these researches were subsequently repeated, after the discovery of his notebooks and manuscripts over a century later, by the great Scottish mathematical physicist, James Clerk Maxwell, who devoted the last five years of his life to the task and published an annotated version of the electrical papers of Cavendish in 1879.

Cavendish's researches on heat likewise remained largely unpublished during his lifetime. They anticipated later work by a Scottish chemist, Joseph Black, and there is some evidence that Cavendish deliberately delayed publication of this work so as not to appear to be competing with Black.

Other contributions. Not all of his work was in pure science. He also interested himself in meteorology and other applied sciences. On one occasion, he served as member of a committee charged with the practical task of devising the best method of protecting a powder magazine at Purfleet from lightning; on another, he helped to investigate the physical properties of gold alloys, in response to the government's concern over the loss of gold in coins, owing to wear.

His last research, performed when he was nearly 70, was the very difficult and exacting job, known as the Cavendish experiment (*q.v.*), of deducing the density of the Earth from measurements made by means of an intricate apparatus involving a highly sensitive torsional balance—a horizontal rod suspended from its centre by a thin wire or fibre that resists a twist. A British physicist, John Henry Poynting, who later developed an analogous method employing a common balance, said in his book *The Earth* (1913) that Cavendish made his experiment "in a manner so admirable that it marks the beginning of a new era in the measurement of small forces."

Cavendish died in his 78th year after what was very likely his first illness and was buried in what is now Derby cathedral, England. He left his considerable fortune to his relatives, most of it to Lord George Cavendish, the son of his first cousin. He left nothing to science, an omission that the Cavendish family repaired in 1871 by endowing the Cavendish Laboratory in Cambridge University where, under a succession of brilliant directors, much of the development of modern physics took place. (Ch.S./Ed.)

BIBLIOGRAPHY. *A Life* by George Wilson was published in 1851 (reprinted 1975). The previously unpublished *Electrical Researches*, edited and partially repeated by J.C. Maxwell, came out in 1879 (reprinted 1967). In 1921, a two-volume edition of previously published papers, together with some of the unpublished experiments, appeared as *The Scientific Papers of the Honourable Henry Cavendish, F.R.S.*; vol. 1 (rev. by Sir Joseph Larmor), contains the electrical researches, and vol. 2 (ed. by Sir Thomas Edward Thorpe, with additions by Charles Chree and others), the chemical and dynamical work. A more recent biography is A.J. Berry, *Henry Cavendish: His Life and Scientific Work* (1960).

Among articles dealing with specific aspects of the work of Cavendish are: C. Susskind, "Henry Cavendish, Electrician," *J. Franklin Inst.*, 249:181-188 (1950), which emphasizes his contributions to electrical theory; and R. McCormach's concise biographical account in *Dictionary of Scientific Biography*, vol. 3 (1971), which also contains an extensive bibliography of original and secondary works.

Cavendish, Spencer Compton: see Devonshire, Spencer Compton Cavendish, 8th duke of.

Cavendish, Thomas, Cavendish also spelled CANDISH (baptized Sept. 19, 1560, Trimley St. Martin, Suffolk, Eng.—d. c. May 1592, in the North Atlantic), English navigator and freebooter, leader of the third circumnavigation of the Earth.

Thomas Cavendish, engraving
The Mansell Collection

Cavendish accompanied Sir Richard Grenville on his voyage to America (1585) and, upon returning to England, undertook an elaborate imitation of Sir Francis Drake's circumnavigation. On July 21, 1586, he sailed from Plymouth with 123 men in three vessels. He reached the Patagonian coast of South America, where he discovered Port Desire, now Puerto Deseado, Arg., his only significant contribution to geographical knowledge. After passing through the Strait of Magellan, he attacked Spanish settlements and shipping from South America to Mexico. Among his prizes was the treasure galleon "Santa Ana," seized off the coast of California (Nov. 14, 1587). After touching the Philippines, the Moluccas, and Java, he rounded the Cape of Good Hope and arrived at Plymouth on Sept. 9/10, 1588, with only one of his ships, the "Desire," and much plunder. On his second American-Pacific venture, undertaken in 1591, his fleet failed to traverse the Strait of Magellan, and Cavendish died trying to get back to England.

Cavendish, William: see Devonshire, William Cavendish, 4th duke of; Newcastle, William Cavendish, 1st duke of.

Cavendish experiment, measurement of the force of gravitational attraction between pairs of lead spheres, which thus allowed the first calculation of the value of the gravitational constant, G , the number expressing the proportionality between the attractive force exerted by two objects and the ratio of the product of their masses to the square of the distance between them (Newton's law of universal gravitation). The experiment was performed in 1797–98 by the English scientist Henry Cavendish. He followed a method prescribed and used apparatus built by his countryman, the geologist John Michell, who had died in 1793. The apparatus employed was a torsion balance, essentially a stretched wire supporting spherical weights. Attraction between pairs of weights caused the wire to twist slightly. The experiment was popularly known as weighing the Earth because determination of G permitted calculation of the Earth's mass.

caviar, the eggs, or roe, of sturgeon preserved with salt. It is prepared by removing the egg masses from freshly caught fish and passing them carefully through a fine-mesh screen to separate the eggs and remove any extraneous bits of tissue and fat. At the same time, 4–6 percent salt is added to preserve the eggs

and bring out the flavour. In Iran, borax is used in addition to salt. The better grades of caviar are classified *malassol*, Russian for "lightly salted." Fresh caviar must be stored at between 32° and 45° F (0° and 7° C) or it deteriorates rapidly; for better storage it is pasteurized. Most true caviar is produced in Russia and Iran, from fish taken from the Caspian and Black seas.

Caviar is graded according to the size of the eggs and the manner of processing. Grades are named for the types of sturgeon from which the eggs are taken: *beluga*, the largest, is black or gray; the smaller *oseetrova* grayish, gray-green, or brown; *sevruga*, the smallest, is greenish black. The rarest caviar, made from the golden eggs of the sterlet, was formerly reserved for the table of the tsar; more recently it found its way to the tables of Soviet dignitaries and that of the shah of Iran. Lesser grades of caviar, made from broken or immature eggs, are more heavily salted and compressed. This *payusnaya* caviar is preferred by some because of its more intense flavour. The red roe of salmon and that of other fishes is sometimes sold under the name caviar. The roes of whitefish and lumpfish are dyed black with cuttlefish ink to resemble sturgeon eggs.

cavitation, formation of vapour bubbles within a liquid at low-pressure regions that occur in places where the liquid has been accelerated to high velocities, as in the operation of centrifugal pumps, water turbines, and marine propellers. Cavitation is undesirable because it produces extensive erosion of the rotating blades, additional noise from the resultant knocking and vibrations, and a significant reduction of efficiency because it distorts the flow pattern. The cavities form when the pressure of the liquid has been reduced to its vapour pressure; they expand as the pressure is further reduced along with the flow and suddenly collapse when they reach regions of higher pressure. The sudden growth and collapse of these vapour cavities cause the extreme pressures that pit the metal surfaces exposed to the cavitating liquid.

Cavite, province and chartered city, southern Luzon, Philippines. The province has an area of 497 sq mi (1,288 sq km). It extends south of Manila along Manila Bay (northwest) and includes Corregidor Island (*q.v.*). The proximity of Manila provides a job and agricultural market (rice, fish, fruits, vegetables, flowers), particularly for coastal residents. Binakayan is a centre of oyster cultivation. Long a revolutionary centre against the Spaniards, Cavite was the home province of Emilio Aguinaldo, the insurrectionist leader against both Spain and the United States. In addition to Cavite City, the province's chartered cities include Trece Martires (the provincial capital) and Tagaytay. Bacoor, Tanza, Naic, and Ternate are coastal towns; Carmona, Mendez-Nuñez, and Silang are inland population centres. In-dang is the seat of Severino Agricultural College (1964).

Cavite City, located on a promontory in Manila Bay, is primarily a residential centre for Manila commuters. The city was chartered in 1940 and served for a time as the provincial capital. Sanglely Point Naval Base, at the city's outer edge, was an old Spanish naval base that was captured by Commo. George Dewey (May 1, 1898); it functioned as the chief U.S. naval base and fuelling station in Asia until 1941. It continues as a Philippine and U.S. naval air facility and shipyard, and transport equipment is manufactured there. Pop. (1990 prelim.) province, 1,153,000; city, 92,000.

Cavite Mutiny (Jan. 20, 1872), brief uprising of 200 Filipino troops and workers at the Cavite arsenal, which became the excuse for Spanish repression of the embryonic Philippine nationalist movement. Ironically, the harsh reaction of the Spanish authorities

served ultimately to promote the nationalist cause.

The mutiny was quickly crushed, but the Spanish regime under the reactionary governor Rafael de Izquierdo magnified the incident and used it as an excuse to clamp down on those Filipinos who had been calling for governmental reform. A number of Filipino intellectuals were seized and accused of complicity with the mutineers. After a brief trial, three priests—José Burgos, Jacinto Zamora, and Mariano Gómez—were publicly executed. The three subsequently became martyrs to the cause of Philippine independence.

Cavour, Camillo Benso, conte di (count of) (b. Aug. 10, 1810, Turin, Piedmont, French

Cavour, detail of an oil painting by Francesco Hayez; in the Pinacoteca de Brera, Milan

Alinari—Anderson from Art Resource

Empire—d. June 6, 1861, Turin, Italy), Piedmontese statesman, a conservative whose exploitation of international rivalries and of revolutionary movements brought about the unification of Italy (1861) under the House of Savoy, with himself as the first prime minister of the new kingdom.

Family and early life. The Cavour family were an ancient family that had served the House of Savoy as soldiers and officials since the 16th century. Genevan by birth and Calvinist by religion, his mother brought into the Cavour family the influence of Geneva, a city open to all the political, religious, and social movements of the period. The French Revolution imperilled the fortunes of the Cavour family because of their close ties with the ancien régime; but Cavour's father, Michele, reestablished the family in an eminent position in Napoleonic society. Camillo even had as godparents Prince Camillo Borghese—after whom he was named—and Pauline Bonaparte, the Prince's wife and Napoleon's favourite sister.

At the age of 10 he was enrolled at the Military Academy of Turin. As the younger son who could not hope for the economic and social position that would fall to his elder brother, Camillo saw a brilliant career open up before him under the protection of the court of Charles Albert, prince of Savoy and Piedmont. In 1826 he obtained a commission as lieutenant in the corps of engineers.

During his six years at the academy political ideas began to fascinate him; echoes of the constitutionalist Piedmontese revolution of 1821 reached the school, provoking in some of its members a flash of liberal and national spirit that was, however, immediately extinguished. Among his family, Camillo heard the great issues of the day being discussed: the internal politics of France under the restored Bourbons; the revolt against Turkish repression in Greece; the liberal Decembrist rising in Russia in 1825. He showed his sympathy, in his usual enthusiastic manner, with the liberals and with personalities such as Benjamin Franklin and Santorre di Santarosa, the famous ill-fated leader of the 1821 revolution in Piedmont, who was also a distant relative. A close friendship with a cadet three years

his senior, Baron Severino Cassio, seems to have had a particular influence on his political views. Cassio, suspected of republicanism, imbued Camillo with patriotic ideas.

The Cavour family, greatly disturbed by their son's association with a cadet holding compromising political views, ordered Camillo to terminate it—not without provoking his indignation and bitterness. This interference of the family was dictated by expediency, for in July 1824 the marchese Michele had obtained for Camillo the appointment as personal page to Charles Albert. His lack of enthusiasm for the court position and his open ridicule of the page-boy's uniform he was obliged to wear caused a scandal and confirmed the growing suspicions about the rebellious disposition of the young count Cavour. The insulted Charles Albert banished Camillo from court and—vainly—tried to persuade King Charles Felix to strip Camillo of his commission. The episode created an irreparable break between Camillo and the hereditary prince and for about 20 years made it impossible for Cavour to take any part in official political life.

Development of political ideals. His military career began in the engineers. He was first stationed in Turin, then in various frontier posts, where fortifications were being constructed; yet, wherever he was, Cavour remained dissatisfied. In 1830 he was sent to Genoa, where he met Anna Giustiniani Schiaffino, an ardent advocate of ultrademocratic and republican ideas, whose salon was frequented by many members of the Carbonari, the secret revolutionary society whose guiding force then was Giuseppe Mazzini. Cavour's fervent radicalism was inspired by his love for Anna Schiaffino and by his renewed friendship with Severino Cassio, now a fellow officer in the engineers at Genoa.

The French revolution of July 1830, which overthrew the last Bourbon, Charles X, and installed Louis-Philippe, "the citizen king," also played a great part in strengthening Cavour's revolutionary ardour. Under the direction of Severino Cassio, he studied English in order to follow more easily the newspapers reporting political events in Europe. He was influenced by the liberal ideas of the French writers Benjamin Constant and François Guizot, and his adversaries remained those of his childhood: paternalistic absolutism; legitimist reactionaries representing the landed interests, the aristocracy, and the clergy; and the union of throne and altar. Of necessity this attitude pitted him consciously against the caste to which he belonged.

The influence of the events in France on the temperamental, Cavour once again aroused official suspicions, and this time he was subjected to police surveillance. As usual, his father's intervention helped to avert more serious consequences: in this case he was simply transferred to a remote mountain fort. It had become obvious, however, that he could no longer remain in the army, from which he resigned in 1831. His father found him a sort of occupation: he was appointed mayor of a village south of Turin and also became the administrator of extensive holdings in the vicinity belonging to his uncles.

Although these modest occupations served to fill his time and to insulate him from his family, they aggravated his despondency over what appeared to be the end of his political ambitions. Social interests began to absorb him: the problems of poverty and of prisoner education became the subjects of his researches. In 1834 he wrote a memoir on poverty in Piedmont, which was published the following year in London in the *Report from His Majesty's Commissioners for inquiring into the Administration and practical Operation of the Poor Laws*. A second pamphlet on the history of the Poor Laws in England was edited and published by Cavour in 1835 at Turin.

During those years he was at last able to make

his first long-awaited visit to Paris and London, thus widening his knowledge of Europe. He now came to know the two greatest and most advanced Western capitals—both ruled by constitutional and liberal regimes (however much they differed in character) and both attempting to effect the boldest economic and social changes. He took a feverishly active interest in the parliamentary life of England and France; he attended university lectures and visited factories, railways, ports, hospitals, schools, and prisons. The experience he acquired in the two Western capitals and in Geneva set him firmly on the path he had already instinctively chosen: always to follow the "golden mean." He was repelled equally by the revolutionaries who wished to destroy society through terror in order to construct a better one without realizing that their methods would defile human dignity, and by the reactionaries, who, in blindly opposing all progress, eventually provoked revolutionary uprisings. Rejecting all extremes, he wanted above all to be a good European. Yet Cavour always remained a patriot. When his worth and his great ambition were acknowledged in France and one of his friends invited him to abandon the petty and wretched Piedmont of Charles Albert for a brilliant career in France, Cavour rejected the invitation.

In 1835, after his return from his travels, he began to engage in a fruitful series of enterprises that helped him to accumulate a considerable fortune. He also achieved a certain reputation with his writing. Even without directly facing the question of Italy's future political structure, all his writings proclaimed social or economic principles that could in no way be reconciled with the prevailing conditions in Italy. Above all, the economic measures and the construction of railroads proposed by Cavour would have transformed the Italy of that period beyond recognition.

Statesman. Gradually, as the year 1848 drew near and the first gusts of the great revolutionary storm of that year could be felt, Cavour's interest in politics began once more to dominate all others. This is shown by the chronological sequence of his writings. His transition to politics was completed when King Charles Albert decided to embark on measures of reform and to concede a certain amount of freedom to the press. Cavour took advantage of this to found the newspaper *Il Risorgimento*, which soon became the champion of increasingly drastic reforms. After taking a leading part in persuading Charles Albert to grant a liberal constitution, Cavour used *Il Risorgimento* to propagate the idea of an immediate war with Austria (which still ruled Lombardy and Venetia) as a historical necessity. Once elected a member of Parliament in June 1848, however, he assumed an intermediate position between the conservatives and the revolutionaries, thus calling forth the enmity of both left and right.

The war against Austria was undertaken, but developments went against the Piedmontese. This prompted Cavour to offer his services as a volunteer until, on being elected a deputy in the third Legislature (July 1848), he began to fight for the approval of a peace treaty with Austria, although the extremists of the left wanted to continue a war that was, in effect, already lost. The intelligence and expertise he displayed in the debates on financial and military questions gained him a prominent place among the deputies of the majority that supported the right-wing government of Massimo d'Azeglio. In October 1850, he was offered the post of minister of agriculture and soon became the most active and influential member of the Cabinet. Through a series of treaties with France, Belgium, and England, Cavour attempted to bring about the greatest possible amount of free trade. He also sought to form a network of economic interests with the great powers to pave the way for a political alliance

against Austria. His appointment as minister of finance in 1850 was evidence of his growing ambitions.

Cavour now sought to create an alliance between the centre right and the centre left that would form a new majority with greater ability to move toward a policy of secularization and modernization in Piedmont. The alliance, called the *connubio* ("marriage"), brought about the resignation of d'Azeglio, whose parliamentary standing had been completely destroyed. After vain attempts to restore an effective d'Azeglio ministry, Victor Emmanuel II, who had succeeded his father Charles Albert in 1849, resigned himself to entrusting the formation of a government to Cavour, who from that time (Nov. 4, 1852) until his death was his country's acknowledged political leader.

The European drama into which Cavour was drawn against his will began in 1854 with the Crimean War (1853–56), which saw France and England allied against Russia in order to defend the integrity of the Turkish territory threatened by Russia's determination to open the Dardanelles for passage from the Black Sea to the Mediterranean. Victor Emmanuel immediately pledged his help to the French and English representatives. Cavour, whose ministers voted against the Crimean venture, was on the point of being dismissed by the King if he rejected the alliance or of being forced to resign by his colleagues if he accepted it. Accepting the alliance with customary boldness and self-confidence, he averted dismissal by the King and embarked upon war. The turning point of the war came with the Anglo-French-Sardinian victory that persuaded Austria to cast aside its neutrality and, by means of an ultimatum, force Russia to make peace.

With some difficulty, Cavour secured the participation of the small power of Piedmont in the peace negotiations at the Congress of Paris (1856), at which the greatest European powers were represented. By supporting Napoleon III's undeclared yet obvious intention to intervene militarily in Italy in the near future and by taking advantage of the general animosity toward Austria, which had joined the allies in the Crimean War only when victory over Russia was assured, Cavour succeeded in proposing the discussion of the Italian problem on the grounds that it was one that threatened European peace. In his view, peace was threatened by Austrian encroachment, papal misgovernment in central Italy, and the autocratic rule of the Spanish Bourbons in southern Italy. Thus, for the first time, the Italian question was presented for diplomatic consideration in a manner favouring the liberation of the peninsula. The difficulty was to persuade the two great powers, France and England, to persevere in their support of an anti-Austrian policy on the part of Piedmont.

In Paris, Cavour had occasion to meet and appraise the stature of Europe's most capable diplomats and to examine the reasons behind the policies of the great powers. He knew full well that it was illusory to hope for the disinterested assistance of Europe in the Italian cause; nevertheless, with his tireless energy and unlimited capacity to take advantage of the most adverse situations, he finally succeeded in winning Napoleon III over to his side. His trump card was the proposition to reestablish France as the leading power on the Continent by an expedition into Italy that would replace Austrian domination of the peninsula with French rule.

At a secret meeting at Plombières in July 1858, Napoleon III and Cavour agreed to provoke a European war against Austria in the following year. At the first suspicions of a secret agreement, the European powers—espe-

cially England—began a campaign to prevent the French and Piedmontese from carrying out their intentions, a campaign so intense that Cavour saw himself being dragged toward the brink of personal and national catastrophe. He was saved by an incredible blunder on the part of Austria, which sent an ultimatum threatening war unless Piedmont disarmed at once. The Franco-Piedmontese alliance accordingly came into force, and this time Austria's superior military power was counterbalanced by the French contribution. Franco-Piedmontese victories followed one after another until Napoleon signed an armistice with Emperor Francis Joseph I at Villafranca in July 1859.

The war had unleashed revolutionary movements in Tuscany, in the duchies of Modena and Parma, and in the papal states between the Po and the Apennines, from Bologna to Cattolica; the ducal rulers had been expelled, as had the papal legates. The armistice seemed to call everything into question, except for Victor Emmanuel's acquisition of Lombardy, which was a minimal gain compared with Cavour's dreams of liberating Italy from the Alps to the Adriatic. At Villafranca, Cavour vented his rage and frustration on the King and resigned his office.

Contrary to his usual perception, he realized only later the advantages to be derived from the armistice. The revolutionary landslide in Italy could no longer be checked, nor could the French emperor withdraw from his position as protector of Italian self-determination. After being returned to power by the reluctant king in January 1860, Cavour worked for the annexation of the central duchies that had formerly belonged to the ancient rulers of Piedmont; he was able to do this only by ceding Savoy and Nice to France.

Unification of Italy. The surrender of Nice to France vastly sharpened the conflict between Cavour and Giuseppe Garibaldi, for Nice was the popular hero's birthplace. The surrender of Piedmont's Alpine bulwark could be compensated for only by territorial expansion into central Italy (at the pope's expense) and into the Kingdom of the Two Sicilies. But Cavour, by now the black sheep of European diplomacy for having disturbed its tranquillity too often, was not in a position to take the initiative, even though England now favoured his policy.

It was Garibaldi who resolved the stalemate caused by Cavour's enforced inactivity. Sailing with his famous Thousand to Sicily, he destroyed Bourbon rule there and in the south. The daring diplomacy of Piedmont and Cavour seemed momentarily to be eclipsed by the military exploits of the red-shirted hero, but more important, there now appeared the first outlines of rivalry between a moderate, monarchist Italy and a revolutionary, republican Italy. The danger of a rupture was averted by the good sense and magnanimity of Garibaldi and by a diplomatic stratagem of Cavour. Cavour, taking up his stance before Europe as the defender of law and order against revolutionary excesses, and before Napoleon as the defender of the last strip of papal territory against attack by Garibaldi, sent an army under Victor Emmanuel across Marche and Umbria in order to check the "hero of the two worlds" and to weld the two Italies into one united kingdom.

There still remained the problem of establishing a capital. Cavour felt that only Rome could be the capital of the new state; but that meant he had to face the most complex problem of his life—that of the position to be assigned to the pope, the head of Catholicism, once Rome had become the capital of Italy. Cavour wholeheartedly accepted the concept of the separation of church and state; in his negotiations with the papacy he became a pas-

sionate supporter of the idea. He maintained that the liberty of the church was to be the fulcrum of the renewal of the world, even though this involved the renunciation of its temporal power and the surrender of Rome to the Italian nation. An entirely spiritual church and papacy, he asserted, would revive mankind. Pius IX's answer to these proposals was negative. But while Cavour was still vigorously promoting his formula of "a free church in a free state," he fell seriously ill and died, after having formed a nation in 10 years of impassioned and restless activity.

cavy, any of several South American rodents belonging to the family Caviidae (order Rodentia), which also includes the domestic guinea pig. Cavies, except for the Patagonian and salt desert cavies (*Dolichotis*), are small, stout animals resembling gray or brown guinea pigs. They are 25 to 30 centimetres (10 to 12 inches) long and have short ears, short legs, and no visible tail. They are placed in four genera: *Cavia* (true cavies); *Kerodon* (rock cavy); and *Galea* and *Microcavia* (mountain, marsh, and pampas cavies).

The Patagonian cavy, or mara (*Dolichotis patagonia*), and the salt desert cavy (*D. salinicola*) are long-legged, rather rabbit-like, hopping animals with relatively large ears, large eyes, short tails, and, unlike other cavies, hooflike nails on the hind toes. The Patagonian cavy is large, attaining a length of 75 cm and a weight of as much as 16 kilograms (35 pounds). The salt desert cavy is smaller, about 45 cm long.

Cavies are social animals. They live in burrows, sometimes undermining the ground so completely that it collapses when walked on, and they feed on grass, leaves, and other available vegetation. They are found in various habitats, including plains, marshes, and rocky areas. Most are nocturnal; the Patagonian and salt desert cavies are diurnal and spend much

Patagonian cavy (*Dolichotis patagonia*)

time basking in the sun. True cavies breed twice yearly, the female bearing one to four young after about two months' gestation.

The spotted cavy (see paca) is a rodent of an entirely different family, Dasyproctidae.

Cawahib (people): see Kawaib.

Cawdor, village and castle in the Highland council area, historic county of Nairnshire,

Scotland, south of Nairn, near Inverness. The local castle, according to a now discredited tradition perpetuated by Shakespeare, was the scene of the murder of King Duncan I by Macbeth, the thane of Cawdor, in 1040. The oldest part of the present castle dates from 1454, however, and there is no evidence of an earlier structure. The castle remains the seat of the earls of Cawdor. Pop. (1981) 617.

Cawnpore (India): see Kānpur.

Caxias, city, east central Maranhão state, northeastern Brazil, on the Rio Itapicuru, at 207 ft (63 m) above sea level. Formerly known as São José das Aldeias Altas, it was renamed to honour Luis Alves de Lima e Silva, duque de Caxias, governor and military commander in Maranhão (1837). The city is the commercial centre of eastern Maranhão and processes rice, cotton, carnauba and babassu palms (for oil), cashews, and almonds that are grown in the region. The seat of a bishopric, Caxias is accessible by railroad, highway, and air from São Luís, the state capital (171 mi [275 km] northwest), and neighbouring communities, including Teresina (40 mi southeast), capital of Piauí state. Pop. (2000 prelim.) 139,551.

Caxias, Luiz Alves de Lima e Silva, duque de (duke of) (b. Aug. 25, 1803, Rio de Janeiro—d. May 7, 1880, Rio de Janeiro), military hero and statesman who gave the military a prominent position in the government of the Brazilian empire.

Caxias

By courtesy of the Library of Congress, Washington, D.C.

Caxias kept up his family's tradition by joining the military service at age 14, and within a year he was promoted to second lieutenant. At 21 he was appointed adjutant of the battalion of the emperor. Caxias first displayed his military skills during the war of independence (1823) in the state of Bahia. On April 7, 1831, the emperor Pedro I abdicated, and Caxias organized a battalion to police Rio de Janeiro until a new government was formed. After becoming governor of the state of Maranhão in 1837, Caxias was elected to Brazil's House of Deputies in 1840.

Caxias resumed his military career when he was asked to pacify local disturbances in the states of São Paulo, Minas Gerais, and Rio Grande do Sul (1841-45), where a separatist revolt was in progress; in 1852 he was appointed to lead the Brazilian troops that helped overthrow the Argentine dictator Juan Manuel de Rosas. In 1855 Caxias was named minister of war, a post he held for many years; he also served as president of the council of ministers twice (1866 and 1875-78). In 1867 Caxias was given command of the army, which had suffered two years of reverses during the Paraguayan War (1864-70). After his capture of Asunción in 1869, he was named duke of the empire and was considered the champion of the conservatives in Brazil.

Caxias do Sul, city, northeastern Rio Grande do Sul state, southern Brazil, lying at 2,490 ft (760 m) above sea level on the range of hills separating the Antas and Caí river valleys. It

was founded in 1875 by Italian colonists and given city status in 1910. Metallurgic industries and viticulture are the city's economic mainstays; the vineyards of the surrounding area are considered Brazil's best. The Universidade de Caxias do Sul (1967) is located there. Caxias do Sul is the terminus of a branch railway line from Pôrto Alegre, the state capital, to the south; it is also on a major highway running north to São Paulo. Pop. (2000 prelim.) 360,207.

Caxton, William (b. c. 1422, Kent, Eng.—d. 1491, London), the first English printer, who as a translator and publisher exerted an important influence on English literature.

In 1438 he was apprenticed to Robert Large, a rich mercer, who in the following year became lord mayor of London. Large died in 1441, and Caxton moved to Bruges, the centre of the European wool trade; during the next 30 years he became an increasingly prosperous and influential member of the English trading community in Flanders and Holland. In 1463 he took up duties as "Governor of the English Nation of Merchant Adventurers" in the Low Countries—a post of real authority over his fellow merchants. Some time in 1470 he ceased to be governor and entered the service of Margaret, duchess of Burgundy, possibly as her financial adviser.

In that period Caxton's interests were turning to literature. In March 1469 he had begun to translate Raoul Le Fèvre's *Recueil des histoires de Troye*, which he laid aside and did not finish until Sept. 19, 1471. In Cologne, where he lived from 1470 to the end of 1472, he learned printing. In the epilogue of Book III of the completed translation, entitled *The Recuyell of the Histories of Troye*, he tells how his "pen became worn, his hand weary, his eye dimmed" with copying the book; so he "practised and learnt" at great personal cost how to print it. He set up a press in Bruges in about 1474, and the *Recuyell*, the first book printed in English, was published there in 1475. Caxton's translation from the French of *The Game and Playe of the Chesse* (in which chess is treated as an allegory of life) was published in 1476.

Caxton printed two or three other works in Bruges in French, but toward the end of 1476 he returned to England and established his press at Westminster. From then on he devoted himself to writing and printing.

Although a pioneer of printing in England, Caxton showed no great typographical originality and produced no books of remarkable beauty. The first dated book printed in English, *Dictes and Sayenges of the Philosophers*, appeared on Nov. 18, 1477. Kings, nobles, and rich merchants were Caxton's patrons and sometimes commissioned special books. His varied output—including books of chivalric romance, conduct, morality, history, and philosophy, and an encyclopaedia, *The Myrroure of the worlde* (1481), the first illustrated English book—shows that he catered also to a general public. The large number of service books and devotional works published by Caxton were the staple reading of most literate persons. He also printed nearly all the English literature available to him in his time: *Canterbury Tales* (1478? and 1484?) and other poems by Chaucer, John Gower's *Confessio amantis* (1483), Sir Thomas Malory's *Morte Darthur* (1485), and much of John Lydgate. Caxton translated 24 books, some of them immensely long. By the time of his death, he had published about 100 items of various kinds.

cay, also spelled **KEY**, small, low island, usually sandy, situated on a coral reef platform. Such islands are commonly referred to as keys in Florida and parts of the Caribbean. Sand cays are usually built on the edge of the coral platform, opposite the direction from which the prevailing winds blow. Debris broken from

the reef is swept across the platform at high tide but is prevented from washing over the edge by waves produced by the refraction and convergence of waves around the platform itself. The accumulation of sand may at first move around but gradually will become stabilized as beach rock (sand and debris cemented at water level by precipitated calcium carbonate) is formed and the tiny island becomes vegetated. The sand is generally built to 1½ to 3 metres (5 to 10 feet) above the high-tide level, although the wind may raise dunes somewhat higher. A cay is often elongated perpendicular to the prevailing winds, but its shape may change considerably with deposition in calm weather and erosion during storms. Even fairly large cays are vulnerable to complete destruction by severe hurricanes or typhoons. Occasionally sand cays may have a rampart of coarse material on the windward side, just beyond a shallow lagoon filled with mangroves. In some cases cays or ramparts that consist of chunks of dead coral and other debris may form on the windward edge of the coral reef platform.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Cayapa, Indians of the coastal lowlands of western Ecuador, one of the few aboriginal groups left in the region. The Cayapa speak a Chibchan language somewhat related to the language of the neighbouring Colorado people. Like the Colorado, the Cayapa believe themselves to be descended from peoples of the Andean highlands. The Cayapa probably numbered about 3,000 in the early 1970s.

Agriculture, fishing, and hunting are the chief sources of food for the Cayapa. Plantains, manioc, sugarcane, yams, and peppers are grown; some domestic animals are raised, but they are not a major food source. Fish and shellfish are abundant, and many species of jungle animals are hunted. A typical settlement consists of single-family households spread through the tropical forest along a river or stream. The traditional house has a thatched roof supported by posts; it is usually unenclosed but is sometimes divided into two sections. Women wear ankle-length wraparound skirts, men a pair of short, tight pants and a thin calico shirt. Weaving, pottery, and woodworking are the chief crafts. The religion of the Cayapa is a mixture of Roman Catholicism and aboriginal pagan beliefs. Their political system consists of hereditary chiefs and subordinate officials.

Cayenne, capital and Atlantic port of French Guiana, at the northwestern end of the Ile de Cayenne, an island formed by the estuaries of the Cayenne and Mahury rivers. Founded in 1643 by the French as La Ravardière, it was reoccupied in 1664 after destruction by the Indians and was declared a city and renamed Cayenne in 1777. After the emancipation of slaves in 1848, it became a centre of French penal settlements in Guiana, established mainly as compensatory labour sources. In 1852 Napoleon III decreed that convicts with sentences of more than seven years were to be sent to French Guiana, and Cayenne became known as the city of the condemned. The prisons were closed in 1945.

The port of Dégrad des Cannes, on the estuary of the river Mahury, has become the major port, replacing Larivot and the Iles du Salut. Timber, rosewood essence, rum, and gold are exported in small quantities. In the mid-1960s sugarcane and pineapple were planted around the city, and a pineapple canner and a shrimp-processing plant were later built. A seafront avenue links Cayenne with the suburbs of Chaton and Montabo, where the French Institute of Tropical America and the Pasteur Institute are located. Historic land-

marks include the Church of the Holy Saviour and a prefecture on the Place d'Armes. There is an international airport.

The Government Building, Cayenne, French Guiana
Peter L. Gould

The city is the administrative seat of Cayenne *arrondissement* (area 19,112 sq mi [49,500 sq km]) established in 1969, comprising part of the Inini (*q.v.*) hinterland and the tropical coastal strip of French Guiana, which ranges from 15 to 50 mi (24 to 80 km) in width. Pop. (1999) mun., 50,594; *arrondissement*, 84,181.

cayenne pepper, very pungent spice produced by drying and grinding the orange to deep-red fruits of small-fruited species of *Capsicum*. See pepper.

Cayes (Haiti): see Les Cayes.

Cayey, town and municipality, central Sierra de Cayey, Puerto Rico. The town, at an altitude of 1,300 ft (400 m), was founded in 1773 as Cayey de Muesas on the Spanish military highway linking San Juan with Ponce on the southern coast; its cool summers made it a favourite Spanish military post. It has some clothing and tobacco industries. Cayey University College, affiliated with the University of Puerto Rico, was founded in 1967.

The municipality, with an area of 50 sq mi (130 sq km), has 2 urban and 20 rural *barrios* (wards). The principal economic activity is tobacco growing. Pop. (2000) town, 19,940; mun., 47,370.

Cayley, Arthur (b. Aug. 16, 1821, Richmond, Surrey, Eng.—d. Jan. 26, 1895, Cambridge, Cambridgeshire). English mathematician who played a leading role in founding the modern British school of pure mathematics.

Arthur Cayley, detail of an oil painting by W.H. Longmaid, 1884; in the collection of Trinity College, University of Cambridge, England

By courtesy of The Master and Fellows of Trinity College, Cambridge, England

Cayley was born during a periodic visit of his family to England from Russia, where his father was engaged in trade. Cayley's remarkable mathematical ability became apparent by his skill as a child in doing complex calculations for amusement. On the advice of school

authorities, his father, who had by then settled in England, enrolled him in May 1839 at Trinity College, University of Cambridge, where he mastered Greek, French, German, and Italian and distinguished himself in mathematics.

Following his graduation in 1842, he obtained a three-year appointment at Trinity, which allowed him to begin work on the problems in mathematics that occupied his attention for the next 50 years. During this extremely productive period, he also began a lifelong interest in mountaineering, painting, and travel.

Because no positions in mathematics were open to him when his term ended in 1845, he entered Lincoln's Inn, London, to prepare for a legal career. Admitted to the bar in 1849, Cayley earned just enough by practicing law during the next 14 years to allow him to pursue his interest in mathematics. During this time Cayley wrote his brilliant mathematical papers. In 1850 he met James Joseph Sylvester, a fellow lawyer and mathematician, and the two thenceforth spent much time in enthusiastic collaboration.

Cayley's work treated nearly every subject of pure mathematics. The concept that the order of points formed by intersecting lines is always invariant, regardless of spatial transformations, is an application of the theory of algebraic invariance, which he originated and developed with encouragement from Sylvester. This concept is of importance in working out space-time relationships in physics. Cayley's development of the geometry of spaces of any number of dimensions is also significant in conceptualizing four dimensions (space-time) in relativity and in going beyond the dependence on points and lines as elements by which geometric space is constructed. Cayley also developed the algebra of matrices, which are arrays of numbers in rows and columns, in which the order and direction of multiplication determines the quantitative result. This tool was used by the German physicist Werner Heisenberg in 1925 for his work in quantum mechanics.

Cayley also prepared the way for the idea that Euclidean and non-Euclidean geometries are special cases of the same kind of geometry. He did this by devising a means of uniting projective geometry, which is dependent upon invariant properties of figures, and metrical geometry, which is dependent upon sizes of angles and lengths of lines. He also prepared two reports—on theoretical dynamics and on the mean motion of the Moon—for the British Association for the Advancement of Science (1857, 1862).

Cayley practiced law until 1863, when he was elected to the new Sadlerian chair of pure mathematics at Cambridge. He married Susan Moline the same year. From the time of his arrival at Cambridge until his death he was constantly engaged in mathematical investigation. He was also influential in assisting women to be admitted as students for the first time. His lectures at Cambridge attracted very few students; among them, however, was A.R. Forsyth, who succeeded him in the Sadlerian chair and, by introducing the new theory of functions that had been making progress in France and Germany, helped to bring English mathematics back into the mainstream of European trends.

In 1881–82 Cayley lectured at Johns Hopkins University in Baltimore on Abelian functions—a means of combining numbers such that the result of mathematical treatment is independent of the order. At Johns Hopkins he again met his friend Sylvester, who had become professor there in 1876.

Cayley was the recipient of nearly every academic distinction that can be conferred

upon an eminent man of science: honorary degrees from several universities, election as fellow or foreign corresponding member of the academies of several countries, and the Copley Medal in 1883 from the Royal Society of London. At various times he was president of the Cambridge Philosophical Society, of the London Mathematical Society, and of the Royal Astronomical Society.

BIBLIOGRAPHY. The basic biography is by A.R. Forsyth in vol. 8 of *The Collected Mathematical Papers of Arthur Cayley* (1895). E.T. Bell, *Men of Mathematics*, ch. 21 (1937, reissued 1986), studies Cayley and Sylvester.

Cayley, Sir George, 6TH BARONET (b. Dec. 27, 1773, Scarborough, Yorkshire, Eng.—d. Dec. 15, 1857, Brompton, Yorkshire), English pioneer of aerial navigation and founder of the science of aerodynamics, who built the first successful man-carrying glider.

Absorbed from childhood by problems of flight, Cayley rejected the notion of using movable wings for flight and devoted himself to the problems of the fixed-wing airplane, the helicopter, and the airship. By 1799 he

George Cayley, detail of an oil painting by Henry Perronet Briggs, 1840; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

had established the basic configuration of the modern airplane, complete with fixed wings, fuselage, and a tail unit with elevators and rudder. In 1804 Cayley flew the first of his successful model gliders and in 1809 published his first researches, which form the basis of modern aerodynamics. He devoted much of his life to aeronautical research and writing, including the advantages of streamlining, problems of longitudinal and lateral stability, the design of wing surfaces for maximum lift, rudder and elevator action, and superposed wings (which were eventually used in biplanes and triplanes), testing all of his ideas with small models. Cayley's efforts culminated in 1853 with a full-size glider that carried his reluctant coachman on the first manned glider flight.

Cayley also invented the light-tension wheel (forerunner of the bicycle wheel), the expansion-air engine (hot-air engine) about 1805, and the caterpillar tractor (1825). He founded the Regent Street Polytechnic Institution, London, in 1839. Among other fields in which he did research were scientific education, land reclamation, acoustics, railway equipment, lifeboats, ballistics, optics, and electricity.

Caylus, Anne-Claude-Philippe de Tubières, comte de (count of) (b. Oct. 31, 1692, Paris—d. Sept. 5, 1765, Paris), French archaeologist, engraver, and man of letters.

The only son of the Marquise de Caylus, he fought with distinction in the War of the Spanish Succession (1704–14). After the war he resigned his commission to travel to Italy,

Caylus, detail of an engraving by N.-H. Jacob
J.P. Ziolo

then to Constantinople and Greece, and later in the Netherlands and England. Returning to Paris, he devoted his life to engraving and archaeology, winning election to both the Académie de Peinture et Sculpture and the Académie des Inscriptions. His principal work is *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines, et gauloises*, 7 vol. (1752–67?; "Collection of Egyptian, Etruscan, Greek, Roman, and Gallic Antiquities").

cayman (reptile): see caiman.

Cayman Islands, British colony in the Caribbean Sea, composed of the islands of Grand Cayman, Cayman Brac, and Little Cayman. The islands are located about 180 miles (290 km) northwest of Jamaica, and their total land area, including inland water, is 102 square miles (264 square km). The capital, George Town, is on Grand Cayman Island. The population in 1990 was estimated to be 25,000.

For information about regional aspects of the Cayman Islands, see MACROPAEDIA: West Indies.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. The Cayman Islands are low-lying for the most part, although Cayman Brac has a central limestone bluff, and the coasts are reefed and rocky. The white sand of the broad, clean beaches is composed chiefly of coral and thus remains cool even on the hottest days. The largest and most populous island is Grand Cayman, about 22 miles (35 km) long and 8 miles (13 km) across at its widest, with a total area of 76 square miles (197 square km). Cayman Brac, about 89 miles (143 km) northeast of Grand Cayman, is the next largest island; it is about 12 miles (19 km) long, averages about 1 mile (1.6 km) in width, and has the highest elevation of the group, rising to 140 feet (42 m) above sea level. Its total area is 14 square miles (36 square km). The smallest of the islands, Little Cayman, lies 5 miles (8 km) west of Cayman Brac; it is 10 miles (16 km) long, has a max-

Cayman Islands

imum width of 2 miles (3 km), and a total area of 10 square miles (26 square km). There are no streams on any of the islands.

A pleasant tropical climate is one of the colony's main assets, tourism being of primary importance to the economy. Temperatures are moderate throughout the year, averaging about 81° F (27° C) annually. The rainy season extends from mid-May through October, and the dry season lasts the balance of the year. Rainfall at George Town averages about 60 inches (1,524 mm) yearly. The islands lie in the path of Caribbean hurricanes.

Mangrove swamp covers about 30 percent of the land area. A variety of commercially useful trees grow on the islands, among them coconut palms, breadfruit, banana, and mango and those producing citrus fruits. There are also thatch palm and some logwood and mahogany trees. The only indigenous mammal is the agouti. There are many reptiles, including the green sea turtle. Iguanas, other lizards, and frogs are also common, and the islands are rich in bird life.

The people. About one-fourth of the Caymanians are European, mostly of British stock; about one-fourth are descendants of African slaves; and the remainder are predominantly of mixed ancestry. The main spoken and official language is English, which occurs in a variety of dialects; Spanish is frequently a second language. The main population centre is George Town, where about half the population lives. The chief religious groups are the Presbyterians, mostly on Grand Cayman, and the Baptists, chiefly on Cayman Brac. The Cayman Islands have a low annual rate of population increase.

The economy. Tourism and finance are the major industries of the Cayman Islands. The islands' physical beauty and their superb climate have made them a popular resort. The government invests heavily in the promotion of tourism, which increased eightfold between the mid-1970s and the early '90s. Most visitors are from the United States. The growth of the financial community has been encouraged by the islands' favourable laws governing taxes and confidentiality of accounts. There are more than 500 licensed banks and trust companies in the colony.

The chief occupations on the Cayman Islands are in clerical and service work and in the construction trades. Agriculture occupies only a small number of Caymanians, and most of the islands' food must be imported. The main crops are citrus fruits and bananas, as well as mangoes, plantains, coconuts, sweet potatoes, yams, and tomatoes. Some livestock is raised, chiefly cattle and poultry. Turtles raised on a government turtle farm provide food, shell, and leather. Exports are few. The major imports are machinery and transport equipment, other manufactured items, fuels, and foods.

Automobiles and buses provide the main means of transportation on the islands. The chief port is George Town. Cayman Airways offers flights to Jamaica and the United States and also provides interisland service. There are international airports on Grand Cayman and Cayman Brac.

Government and social conditions. The government of the Cayman Islands colony is administered according to the revised constitution of 1994. It provides for a Legislative Assembly composed of the governor, 3 official members, and 15 elected members. The governor represents the British monarch, who is the head of state. An Executive Council, composed of three official and five elected members, advises the governor. There are two official political parties.

The Caymanians have a relatively high standard of living. The government provides adequate social services, and there is almost no unemployment. Health care is provided by the Health Services Department, which operates a hospital on Grand Cayman and a

smaller one on Cayman Brac. The incidence of tropical disease on the islands is low. Education is compulsory for children between ages 5 and 16 years and is provided free in government primary schools. The government also operates three secondary schools. Higher education is available at the International College of the Cayman Islands (1970). Several newspapers are published on the islands, and there is radio and television service. Theatrical performances and art exhibits are held by community organizations, and many residents engage in craftwork, especially the making of jewelry from black coral.

History. The Cayman Islands were first sighted by Columbus in 1503 on his last voyage to the West Indies. Although uninhabited at that time, the islands were visited by Carib or Arawak Indians. The Spaniards first called the islands Las Tortugas, because of the abundance of turtles in the surrounding waters. In the period 1527-30 they were renamed Cayman (from Spanish *caimán*, meaning "alligator"), a possible mistaken reference to the islands' indigenous iguanas. The Caymans were frequently visited by Spanish, English, and French ships but were not claimed until ceded to the British in 1670. Settlers, mostly from Jamaica, then began arriving on the islands, which became a favourite haunt of pirates and buccaneers. The early settlers were mainly interested in turtle fishing, and they almost exhausted local waters of the species. The Caymanians also developed a reputation as shipbuilders. The remote location of the islands hampered economic development until the 1940s, when they became accessible by air.

The Cayman Islands were administered as a dependency of the colony of Jamaica until 1959, when they became a separate dependency but with the governor of Jamaica acting as governor of the Caymans. After Jamaica became independent in 1962, an administrator assumed most of the powers of the governor in the Cayman Islands. In 1971 the title of administrator was changed to that of governor, and a new constitution approved in 1972 provided for a greater degree of autonomy.

Cayman Trench, also called BARTLETT DEEP, or BARTLETT TROUGH, submarine trench on the floor of the western Caribbean Sea between Jamaica and the Cayman Islands. It extends from the Windward Passage at the southeastern tip of Cuba toward Guatemala. The relatively narrow trough trends east-northeast to west-southwest and has a maximum depth of 25,216 feet (7,686 m), the deepest point in the Caribbean Sea. The Cayman Ridge separates the trough from the Yucatan Basin in the north, and the Jamaica Ridge, which supports the island of Jamaica, separates it from the Colombian Basin farther south. Submarine earthquakes sometimes occur around the edges of the trench.

Cayrol, Jean, in full JEAN-RAPHAËL-MARIE-NOËL CAYROL (b. June 6, 1911, Bordeaux, France—d. Feb. 10, 2005, Bordeaux), French poet, novelist, and essayist who stood at the frontiers of the New Novel (*nouveau roman*), the avant-garde French novel that emerged in the 1950s.

In World War II Cayrol was deported to a concentration camp after participating in the Resistance movement, and that experience is at the heart of his artistic creation. It inspired his first poems, *Poèmes de la nuit et du brouillard* (1945; "Poems of the Night and the Fog"); his seminal essay *Lazarus parmi nous* (1950; "Lazarus Among Us"); and his prizewinning trilogy of novels, *Je vivrai l'amour des autres* (1947-50; "I Will Live the Love of Others"). The figure of Lazarus (a biblical character who was raised from the dead) is a central image in Cayrol's work. His characters are estranged from the normal world of people and things and drift through shadowy, passive existences on its outskirts.

Cayrol was a prolific writer, producing fiction, poems, essays, and screenplays. His novels include *L'Espace d'une nuit* (1954; *All in a Night*) and *Les Corps étrangers* (1959; *Foreign Bodies*), the only translated works to receive a considerable English audience. Other notable novels are *Le Froid du soleil* (1963; "The Chill of the Sun"), *Midi-Minuit* (1966; "Midday-Midnight"), *Je l'entends encour* (1968; "I Still Hear It"), *Histoire d'un prairie* (1969; "History of a Prairie"), *Histoire d'un désert* (1972; "History of a Desert"), *Histoire de la mer* (1973; "History of the Sea"), *Histoire du ciel* (1975; "History of the Sky"), *Histoire de la forêt* (1975; "History of the Forest"), *Histoire d'une maison* (1976; "History of a House"), *Les Quatre saisons* (1977; "The Four Seasons"), and *Exposés au soleil* (1980; "Exposed to the Sun").

Cayrol collaborated with French film director Alain Resnais on the acclaimed Holocaust documentary *Nuit et brouillard* (1955; *Night and Fog*). In 1974 Cayrol was elected to the Académie Goncourt.

Cayuga, Iroquoian-speaking North American Indians, members of the Iroquois Confederacy, who originally inhabited the region bordering Cayuga Lake in what is now central New York state. (See also Iroquois.) Cayuga men hunted the abundant game, waterfowl, and fish of the region, while women cultivated corn (maize). Villages consisted of multiple-fireside longhouses that sheltered related families. When first visited by the French Jesuit René Ménard in 1656, their towns occupied the lands east of the lake above the marshes south of the Seneca River. Approximately 1,500 people lived in some 100 longhouses. The local Cayuga council, which guided the village chiefs, comprised representatives of the eight exogamous clans. The clans were grouped into two major divisions, or moicties, which had largely ceremonial functions at funerals and games.

Throughout their history the Cayuga have been a composite people. When they had a refuge settlement north of Lake Ontario, they took in Huron and Erie captives to replace war losses, and in the late 17th century they absorbed many Siouan-speaking and Algonquian-speaking bands from the near south and west. At the beginning of the American Revolution a large part of the Cayuga tribe, which favoured the British, moved to Canada. After the Revolution the remaining Cayuga sold their New York lands and scattered among other Iroquois peoples in Wisconsin, Ohio, and Grand River, Ontario, where in the late 20th century, on Six Nations Indian Reserve, about 1,500 descendants perpetuated the language and ceremonial life of the tribe. About 200 live among the Seneca nation in western New York, and perhaps 100 live in Oklahoma.

cayuse, also called BRONCO, or MUSTANG, North American wild or Indian-tamed horse,

Cayuses (mustangs)
Mark Mkolos—Bruce Coleman Inc.

descended from horses taken to the New World by the Spanish in the 16th century. The name comes from that of an Indian tribe of eastern Washington and Oregon that was known for the small horses it bred.

CBS Inc., formerly (1928–74) COLUMBIA BROADCASTING SYSTEM, major American broadcasting company and operator of the CBS national radio and television networks. It is a subsidiary of Westinghouse Electric Corporation. The company was incorporated in 1927 as United Independent Broadcasters, Inc., and its name was changed a year later to Columbia Broadcasting System, Inc. Its present name was adopted in 1974. Headquarters are in New York City.

Under the direction of longtime chairman William Paley, CBS made media history beginning in the late 1920s. Paley, whose father owned the company that made La Palina cigars, invested in the Columbia Broadcasting System, which was then a small, struggling radio network, in 1928. Realizing that the key to radio's success was large audiences that would attract advertisers, Paley offered programming free to affiliated stations in return for having a certain part of their schedule devoted to sponsored network shows. From 22 stations in 1928, the network grew to 114 stations in a decade.

Ratings grew during the 1930s with stars such as Phil Harris, Fred Allen, Bing Crosby, and Kate Smith. As television grew more popular during the 1940s, and the appearance of performers became as important as their voices, Paley raided rival NBC, signing up stars such as Amos 'n' Andy, George Burns and Gracie Allen, and Jack Benny, who proved as popular on television as they had been on radio. In subsequent decades, Ed Sullivan, Lucille Ball, Mary Tyler Moore, and newscaster Walter Cronkite were among the personalities who made CBS the most watched television network in the country. CBS remained the dominant network until the late 1970s.

In 1938 CBS acquired the American Recording Corporation, which later became Columbia Records. Peter Goldmark of CBS laboratories invented high fidelity long-playing records, and the Columbia record label introduced them to the public in 1948.

In the 1960s and '70s CBS diversified into the production of books, magazines, musical instruments, and toys. But in the years 1985–88 the company sold off all of these other operations and also sold its highly successful record unit, which was bought by the Sony Corporation. Thenceforth CBS concentrated on its core of operations, television and radio broadcasting. In 1995, amid falling television ratings and a decline in the number and quality of affiliate stations, CBS was sold to Westinghouse.

CD, abbreviation of *Córdoba Durchmusterung* (*q.v.*), an astronomical catalog.

CD: *see* compact disc.

CD: *see* deposit, certificate of.

CD-ROM, abbreviation of COMPACT DISC-READ-ONLY MEMORY, type of computer memory (*q.v.*) in the form of a compact disc that is read by optical means. A CD-ROM disk drive uses a low-power laser beam to read digitized (binary) data that has been encoded onto an optical disk in the form of tiny pits. The drive then feeds the data to a computer for processing. Because it uses digital data, CD-ROM can store images and sound in addition to text and is thus used in video and audio devices to store music, graphics, and movies. Unlike conventional magnetic-storage technologies (*e.g.*, hard disks), CD-ROM drives cannot write information (that is, accept the input of new data), hence the tag "read only." The larger CD-ROMs, however, can store 800 megabytes (800 million bytes) of information.

Viewed as an experimental technology in the late 1980s, CD-ROM achieved broad commercial appeal in the early '90s because it enables the storage of massive quantities of information in a small space. Though information retrieval with CD-ROM is relatively slow, its high-capacity characteristics make it attractive for information-intensive tasks, such as accessing animated graphics or the large amounts of relatively static text in encyclopaedias and other reference works. Because it can be used for text, sound, and graphics, CD-ROM has also become an important storage device in multimedia workstations.

WORM (write *once* read *many*) is a variation of CD-ROM that, as its name implies, allows a user to create and save, or write, information on a disk one time. More advanced drives are capable of writing and rewriting different information on the same disk. CD-Interactive (CD-I) devices are similar to CD-ROM, but they connect to a television set rather than to a computer and emphasize interactive video applications. Finally, magneto-optical (MO) disk drives combine some advantages of CD-ROM with those of magnetic storage technology.

Ceanannus Mór, formerly Kells, market town and urban district of County Meath, Ireland, on the River Blackwater. The town was originally a royal residence. In the 6th century it was granted to St. Columba and became a centre of learning. A bishopric was founded there about 807 and was united to that of Meath in the 13th century. The house of St. Columba, later converted into a church, was built about 807. Near the present church is a round tower, and there are several ancient crosses still standing in the locality. The Book of Kells, an illuminated copy of the Gospels in Latin and containing local records, was probably completed there in the early 9th century. Preserved in the library of Trinity College, Dublin, it is one of the finest extant examples of Hiberno-Saxon manuscript art. The town's industries include the manufacture of computer cabinets. Pop. (1991) 2,183.

Ceanothus, genus of North American shrubs, of the buckthorn family (Rhamnaceae), comprising about 55 species. The leaves are alternate or opposite. The very small blue or white flowers are borne in profuse, erect clusters.

Ceanothus americanus, commonly called New Jersey tea, occurs from Canada to Florida. During the American Revolutionary War, its leaves were used as a tea substitute. The plant grows about 1 m (3 feet) tall and has deciduous, rather oval leaves. The white flowers grow in a flat-topped cluster.

C. arboreus, called Catalina, or felt-leaf, ceanothus, an evergreen tree occurring on the

Ceanothus
J.M. Langham

islands off the coast of California, has leaves with a dark green upper surface and a dense white pubescence beneath. The tree, 5–8 m high, bears fragrant blue flowers in the early spring.
